double daisy, consists of dwarf, showy, 3 to 4 in. plants, flowering freely in spring if grown in rich light soil, and frequently divided and transplanted. The white and pink forms, with the white and red quilled, and the variegated-leaved aucubaefolia, are some of the best.

**DAKAR**

A seaport of Senegal, and capital of French West Africa, in 14° 40' N., 17° 24' W. The town, which is strongly fortified, holds a commanding strategic position on the route between western Europe and Brazil and South Africa, being situated in the Gulf of Goree on the eastern side of the peninsula of Cape Verde, the most westerly point of Africa. It is the only port of Senegal affording safe anchorage for the largest ships. Pop. (1904), within the municipal limits, 18,447; including suburbs, 23,452.

The town consists for the most part of broad and regular streets and possesses several fine public buildings, notably the palace of the governor-general. It is plentifully supplied with good water and is fairly healthy. It is the starting point of the railway to St Louis, and is within five days' steam of Lisbon. The harbour, built in 1904-1908, is formed by two jetties, one of 6830 ft., the other of 1568 ft., the entrance being 720 ft. wide. There are three commercial docks, with over 7000 ft. of quayage, 26 ft. being able to moor alongside. Cargo is transferred directly to the railway trucks. There is also a naval dock and arsenal with a torpedo-boat basin 755 ft. by 410 ft. and a dry dock 650 ft. long and 92 ft. broad. The Messageries Maritimes Company use the port as a coaling station and provisioning depot for their South American trade.

Dakar is a regular port of call for other French lines and for the Elder Dempster boats sailing between Liverpool and the West Coast of Africa. It shares with Rufsique and St Louis the external trade of Senegal and the adjacent regions. For trade statistics see Senegal.

Dakar was originally a dependency of Goree and was founded in 1852, a year after the declaration of a French protectorate over the mainland. The port was opened for commerce in 1867, and in 1885 its importance was greatly increased by the completion of the railway (163 m. long) to St Louis. Dakar thus came into direct communication with the countries of Upper Senegal and the middle Niger. In 1887 the town was made a commune on the French model, all citizens irrespective of colour being granted civic rights.

Dalberg was an important general and of the court of appeal of French West Africa were transferred from St Louis to Dakar, which is also the seat of a bishop. In February 1905 a submarine cable was laid between Brest and Dakar, affording direct telegraphic communication between France and her West African colonies by an all French route.

**DALAGUETE**

A town of the province of Cebu, island of Cebú, Philippine Islands, at the mouth of the Tapón river on the E. coast, 50 m. S.S.W. of Cebú, the capital. The town has a healthy climate, cool during November, December, January and February, and hot during the rest of the year. The inhabitants grow hemp, Indian corn, coffee, sibucan, cacao, coconuts (for copra) and sugar, weave rough fabrics and manufacture taba (a kind of wine used as a stimulant), clay pots and jars, salt and soap. There is some fishing here. The language is Cebú-Visayan.

**DALBEATTIE**

A police burgh of Kirkcudbrightshire, Scotland. Pop. (1901) 3469. It lies on Dalbeattie Burn, 145 m. S.W. of Dumfries by the Glasgow to South Western railway. The town dates from 1753 and owes its rise to the granite quarries at Craigmuir and elsewhere in the vicinity, from which were derived the supplies used in the construction of the Thames Embankment, the docks at Odessa and Liverpool and other works. Besides quarrying, the industries include granite-polishing, concrete (crushed granite) works, dye-works, paper-mills and artificial manures. The estuary of the Urr, known as Rough Firth, is navigable by ships of from 80 to 100 tons, and small vessels can ascend as far as the mouth of Dalbeattie Burn, within a mile of the town. A mile to the north-west stand the ruins of the castle of Buittle or Botel, where lived John de Baloi, founder of Baloi college, who married Dervorgilla, daughter of Alan (d. 1234), the last "king" of Gallovidian Ireland.

**DALBERG**

The name of an ancient and distinguished German noble family, derived from the hamlet and castle (now in ruins) of Dalberg or Dalburg near Kreuznach in the Rhine Province. In the 14th century the original house of Dalberg became extinct in the male line, the fiefs passing to Johann Gerhard, chamberlain of the see of Worms, who married the heiress of his cousin, Anton of Dalberg, about 1330. His own family was of great antiquity, his ancestors having been hereditary ministers of the bishop of Worms since the time of Ekbert the chamberlain, who founded in 1119 the Augustinian monastery of Frankenthal and died in 1132. By the close of the 15th century the Dalberg family had grown to be of such importance that, in 1494, the German King Maximilian I. granted them the honour of being the first to receive knighthood at the coronation; this part of the ceremonies being opened by the herald asking in a loud voice "Is there a Dalberg present?" (Is kein Dalberg da?) This picturesque privilege the family enjoyed till the end of the Holy Roman Empire. The elder line of the family of Dalberg-Dalberg became extinct in 1848, the younger, that of Dalberg-Hamburg, in 1853. The male line of the Dalbergs is now represented solely by the Hereditary Chancellery of Germany from Gerhard of Dalberg (c. 1239), who in 1809 succeeded to the title and estates in Moravia and Bohemia of the extinct counts of Ostein.

The following are the most noteworthy members of the family:

1. **JOHANN VON DALBERG** (1445-1503), chamberlain and afterwards bishop of Worms, son of Wolfgang von Dalberg. He studied at Erfurt and in Italy, where he took his degree of doctor utriusque juris at Ferrara and devoted himself more especially to the study of Greek. Returning to Germany, he became privy councillor to the elector palatine Philip, whom he assisted in bringing the university of Heidelberg to the height of its fame. He was instrumental in founding the first chair of Greek, which was filled by his friend Rudolph Agricola, and he also established the university library and a college for students of civil law. He was an ardent humanist, was president of the Sodalitas Celtica founded by the poet Konrad Celtes (q.v.), and corresponded with many of the leading scholars of his day, to whom he showed himself a veritable Maecenas. He was also employed on various diplomatic missions by the emperor and the elector.

See K. Mornweg, Johann von Dalberg, ein deutscher Humanist und Bischof (Heidelberg, 1887).

2. **KARL THEODOR ANTON MARIA VON DALBERG** (1744-1817), archbishop-elector of Mainz, arch-chancellor of the Holy Roman Empire, and afterwards prince of the Confederation of the Rhine and grand-duke of Frankfurt. He was the son of Franz Heinrich, administrator of Worms, one of the chief counsellors of the elector of Mainz. Karl had devoted himself to the study of canon law, and entered the church; and, having been appointed in 1772 governor of Erfurt, he won further advancement by his successful administration; in 1787 he was elected coadjutor of Mainz and of Worms, and in 1788 of Constance; in 1802 he became archbishop-elector of Mainz and arch-chancellor of the Empire. As statesman Dalberg was distinguished by his "patrician " attitude, whether in ecclesiastical matters, in which he leaned to the Febronian view of a German national church, or in his efforts to galvanize the atrophied machinery of the Empire into some sort of effective central government of Germany. From this, he turned to the French revolution, and his praise that he had found in "the truly great man, the mighty genius which governs the fate of the world," the only force strong enough to save Germany from dissolution. By the peace of Lunéville, accordingly, though he had to surrender Worms and Constance, he received Regensburg, Aschaffenburg and Wetzlar. On the dissolution of the Empire in 1806 he formally resigned the office of arch-chancellor in a letter to the emperor Francis, and was appointed by Napoleon prince-primate of the Confederation of the Rhine. In 1810, after the peace of Vienna (Schönbrunn), the grand-duchy of Frankfurt was created for his benefit out of his
tories, which, in spite of the cession of Regensburg to Bavaria, were greatly augmented. Dalberg's subservience, as a prince of the Confederation, to Napoleon was spiritually resented since, as a priest, he had no excuse of necessity on the ground of saving family or dynastic interests; his fortunes therefore fell with those of Napoleon, and, when he died on the roth of February 1817, of all his dignities he was in possession only of the archbishopric of Regensburg. Weak and shortsighted as a statesman, as a man and prelate Dalberg was amiable, conscientious and large-hearted. Himself a scholar and author, he was a notable patron of letters, and was the friend of Goethe, Schiller and Wieland.

3. WOLFGANG HERIBERT von DALBERG (1752–1806), brother of the above. He was intendant of the theatre at Mannheim, which he brought to a high state of excellence. His chief claim to remembrance is that it was he who first put Schiller's earlier dramas on the stage, and it is to him that the poet's Briefe an den Freiherrn von Dalberg (Karlsruhe, 1819) are addressed. He himself wrote several plays, including adaptations of Shakespeare. His brother, Johann Friedrich Hugo von Dalberg (1752–1812), canon of Trier, Worms and Spire, had some vogue as a composer and writer on musical subjects.

4. EMERICH JOSEPH, DUKE DE DALBERG (1772–1832), son of Baron Wolfgang Heribert. He was born at Mainz on the 30th of May 1773. In 1803 he entered the service of Baden, which he represented as envoy in Paris. After the peace of Schönbrunn (1809) he entered the service of Napoleon, who, in 1810, created him a duke and councillor of state. He had from the first been on intimate terms with Talleyrand, and retired from the public service when the latter fell out of the emperor's favour. In 1814 he was a member of the provisional government by whom the Bourbons were recalled, and he attended the congress of Vienna, with Talleyrand, as minister pleni potentiary. He appended his signature to the decree of outlawry launched in 1815 by the European powers against Napoleon. For this his property in France was confiscated, but was given back after the second Restoration, when he became a minister of state and a peer of France. In 1816 he was sent as ambassador to Turin. The latter years of his life he spent on his estates at Herrnstein, where he died on the 27th of April 1833. The duc de Dalberg had inherited the family property of Herrnstein from his uncle the arch-chancellor Karl von Dalberg, and this estate passed, through his daughter and heiress, Marie Louise Pelline de Dalberg, by her marriage with Sir (Ferdinand) Richard Duke of Acton, 7th baronet (who assumed the additional name of Dalberg) to her son the historian, John Emerich Edward Dalberg-Acton, 1st Baron Acton (q.v.).

DALE, ROBERT WILLIAM (1820–1895), English Nonconformist divine, was born in London on the 1st of December 1820, and was educated at Spring Hill College, Birmingham, for the Congregational ministry. In 1853 he was invited to Carr's Lane Chapel, Birmingham, as co-pastor with John Angell James (q.v.), on whose death in 1859 he became sole pastor for the rest of his life. In the London University M.A. examination (1853) Dale stood first in philosophy and won the gold medal. The degree of LL.D. was conferred upon him by the university of Glasgow during the lord rectorship of John Bright. Yale University gave him its D.D. degree, but he never used it, "not because it came from America, but because I have a sentimental objection—perhaps it is something more—to divinity degrees." Dale displayed a keen interest in Liberal politics and in the municipal affairs of Birmingham; and his high moral ideal made him a great force on the progressive side. In 1886 he adhered to Mr Chamberlain in opposition to Irish Home Rule, but this difference did not diminish his influence even among those Liberals and Nonconformists who adopted the Gladstonian standpoint. In the education controversy of 1870 he took an important part, ably championing the Nonconformist position. When Mr Foster's bill appeared, Dale attacked it on the grounds that the schools would in many cases be purely denominational institutions, that the conscience clause gave inadequate protection, and that school boards were empowered by it to make grants out of the rates to maintain sectarian schools. He was himself in favour of secular education, claiming that it was the only logical solution and the only legitimate outcome of Nonconformist principles. In Birmingham the controversy was terminated in 1870 by a compromise, from which, however, Dale stood aloof. His interest in educational affairs had led him to accept a seat on the Birmingham school board. He was appointed a governor of the grammar school, served on the royal commission of education, and was also chairman of the council of Mansfield College, Oxford, with the foundation of which he had much to do. He was a strong advocate of disestablishment, holding that the church was essentially a spiritual brotherhood, and that any vestige of political authority impaired its spiritual work. In church polity he held that congregationalism constituted the most fitting environment in which religion could achieve her work. Perhaps the most effective contributions he made to ecclesiastical literature were those dealing with the history and principles of the congregational system. At his death on the 17th of March 1895 he left an unfinished MS. of the history of congregationalism, since edited and completed (1907) by his son, A. W. T. Dale, principal of the University of Birmingham.

Dale's powers were fully appreciated by his colleagues in the congregational ministry, and at the early age of thirty-nine he was elected chairman of the Congregational union of England and Wales. His addresses from the chair on "Christ and the Controversies of Christendom," and the "Holy Spirit and the Christian Ministry" were remarkable for a keen insight into the conditions and demands of the age. For some years he edited the Congregationalist, a monthly magazine connected with the denomination. In 1877 he was appointed Lyman Beecher lecturer at Yale University, and visited America to deliver his "Lectures on Preaching." At the International Council of Congregationalists, meeting in London in 1891, the first gathering of the kind, Dale was nominated for the presidency. He accepted the honour and delivered an address on "The Divine Life in Man."

As a theologian Dale occupied an influential position amongst the religious thinkers of the 19th century. He ably interpreted the Evangelical thought of his age, but his Evangelicalism was of a broad and progressive type. His chief contribution to constructive theological thought is his work On The Ationemen, in which he contends that the death of Christ is the objective ground on which the sins of man are remitted. Among his other theological books are: The Epistle to the Ephesians (a series of expositions), Christian Doctrine, The Living Christ and the Four Gospels, Fellowship with Christ, The Epistle to James, and The Ten Commandments.

DALE, SIR THOMAS (d. 1610), British naval commander and colonial deputy-governor of Virginia. From about 1588 to 1600 he was in the service of the Low Countries with the English army originally under Robert Dudley, earl of Leicester; in 1606, while visiting in England, he was knighted by King James; from 1611 to 1616 he was actually though not always nominally in chief control of the province of Virginia either as deputy-governor or as "high marshall," and is best remembered for the energy and the extreme rigour of his administration there, which established order and in various ways seems to have benefited the colony; he himself declared that he left it "in great prosperity and peace." Under him began the first real expansion of the colony with the establishment of the settlement of Henrico on and about what was later known as Farrar's Island; it was he who, about 1614, took the first step toward abolishing the communal system by the introduction of private holdings, and it was during his administration that the first code of laws of Virginia, nominally in force from 1610 to 1619, was effectively tested. This code, entitled "Articles, Laws, and Orders—Divine, Political, and Maritime," but popularly known as Dale's Code, was notable for its pitiless severity, and seems to have been prepared in large part by Dale himself. He left Virginia in 1616.
with the intention probably of returning to the service of the Low Countries, but instead was given command of an English fleet sent against the Dutch, defeated the enemy near Batavia in the East Indies late in the year 1618, arrived at Masulipatam in July 1619, and died there on the 9th of the following month.

An account of Dale's career in Virginia is given in Alexander Brown's The First Republic in America (Boston, 1898); a scholarly discussion of Dale's Code by Walter F. Prince may be found in vol. iii. of the Annual Report of the American Historical Association for 1899 (Washington, D.C., 1900), and the code itself is reprinted in Peter Force's Historical Tracts, vol. iii., No. 11.

DALECARLIA (Dalarne, "the Dales"), a west midland region of Sweden, virtually coincident with the district (län) of Kopparberg, which extends from the mountains of the Norwegian frontier to within 25 m. of Gefle on the Baltic coast. It is a region full of historical associations, and possesses strong local characteristics in respect of its products, and especially of its people. The Dalecarlens or Dalesmen speak their own peculiar dialect, wear their own peculiar costumes, and are famed for their brave spirit and sturdy love of independence. In 1434, led by Engelbrecht, the miner, they rose against the oppressive tyranny of the Catholic Church, and in 1522 among them that Gustavus Vasa found his staunchest supporters in his patriotic task of freeing Sweden from the yoke of the Danes. The districts around Lakes Runn and Siljän ("the Eye of the Dales"), the principal sheets of water in the valleys of the Dal rivers, are consequently classic ground. By the banks of Lake Runn, for example, is seen the barn in which Vasa threshed corn in disguise, when still a fugitive from the Danes. The people are for the most part small peasant proprietors. They eke out their scanty returns from tillin the soil by a variety of home industries, such as making scythes, saws, bells, wooden wares, hair goods, and so forth. About three quarters of the whole district is covered with forest. Besides the wealth of the forests, the Dalesmen produce some of the largest and most prolific iron mines in Sweden, notably those of Gringsberg. Copper is mined at Falun (q.v.), the chief town of Kopparberg, and some silver and lead, zinc and sulphur is found. In consequence of this, the district has numerous smelting furnaces, blast furnaces, rolling mills, iron and metallurgical works, as well as saw-mills, wood-pulp factories, and chemical works.

See G. H. Mellin, Skildringen der den Skandinaviska Nordens Folklig och Natur, vol. iii. (1865); and Frederika Bremer, I Dalarne (1845), of which there is an English translation by William and Mary Howe. A modern attempt to dialect is made in a paper by A. Noreen, De Svenska Landsmålen, vol. iv. (1881).

DALGARNS, JOHN DOBREE (1818-1876). English Roman Catholic priest, was born at Old Aberdeen about 1816. He appears to have studied at Marischal College; but he finally settled in Oxford, where, according to Wood, "he taught a private grammar-school with great success for about thirty years," and where he died on the 8th of August 1867. He was master of Elizabeth school, Guernsey, for some ten years, but resigned in 1872. In his work entitled Didascalocophus, or the Deaf and Dumb Man's Tutor (Oxford, 1680), he explained, for the first time, the hand alphabet for the deaf and dumb, though he does not claim to have invented this method of communication. Twenty years before the publication of his Didascalocophus, Dalgarne had given to the world a very ingenious piece entitled Ars Signorum (1661), dividing ideas into seventeen classes, to be represented by the letters of the Latin alphabet with the addition of two Greek characters. Among the Sloane manuscripts are several tracts by Dalgarne, further elucidating his system of universal shorthand. Leibnitz on various occasions alluded to the Ars signorum in commendatory terms.

The chief works of Dalgarne were reprinted (1834) for the Maitland Club.

DALHOUSIE, JAMES ANDREW BROUN RAMSAY, 1st MARQUESS and 10th EARL OF (1812—1866), British statesman and Indian administrator, was born at Dalhousie Castle, Scotland, on the 22nd of April 1812. He crowded into his short life conspicuous public services in England, and established an unrivalled position among the master-builders of the Indian empire. Denounced on the eve of his death as the chief offender who failed to notice the signs of the mutiny of 1857, and even aggravated the crisis by his overbearing self-consciousness, centralizing activity and reckless annexations, he stands out in the clear light of history as the far-sighted governor-general who consolidated British rule in India, laid truly the foundations of its later administration, and by his sound policy enabled his successors to stem the tide of rebellion.

He was the third son of George Ramsay, 5th earl of Dalhousie (1770-1838), one of Wellington's generals, who, after holding the highest offices in Canada, became commander-in-chief in India, and of his wife Christina Broun of Coaltoun, a lady of noble lineage and distinguished gifts. From his father he inherited a vigorous self-reliance and a family pride which urged him to prove worthy of the Ramsays who had not crawled through seven centuries of their country's history, while to his mother he owed his high-bred courtesy and his deeply seated reverence for religion. The Ramsays of Dalhousie (or Dalwoulse) in Midlothian were a branch of the main line of Scottish Ramsays, of whom the earliest known is Simon de Ramsis, of Huntingdon, England, mentioned in 1140 as the grantee of lands in West Lothian at the hands of David I. A Sir William de Ramsis of Dalhousie swore fealty to Edward I. in 1296, but is famous for having in 1320 signed the letter to the pope asserting the independence of Scotland; and his supposed son, Sir Alexander Ramsay (d. 1342), was the Scottish patriot and capturer of Roxburgh Castle (1342), who, having been made warder of the castle and sheriff of Teviotdale by David II., was soon afterwards fled off and starved to death by his predecessor, the Douglas, in revenge. Sir John Ramsay of Dalhousie (1580-1626), James VI.'s favourite, is famous for rescuing the king in the Gowrie conspiracy, and was created (1606) Viscount Haddington and Lord Ramsay of Barns (subsequently baron of Kington and earl of Holderness in England). The barony of Ramsay of Melrose was granted in 1618 to his brother George Ramsay of Dalhousie (d. 1629), whose son William Ramsay (d. 1674) was made 1st earl of Dalhousie in 1633.

The 9th earl was in 1815 created Baron Dalhousie in the peerage of the United Kingdom, and had three sons, the two elder of whom died early. His youngest son, the subject of this article, was small in stature, but his firm chiselled mouth, high forehead and masterful manner intimated a dignity that none could overlook. Yet his early life gave little promise of the dominating force of his character or of his ability to rise to the full height of his splendid opportunities. Nor did those brought
into closest intimacy with him, whether at school or at Oxford, suspect the higher qualities of statesmanship which afterwards established his fame so firm a foundation.

Several years of his early boyhood were spent with his father and mother in Canada, reminiscences of which were still vivid with him when governor-general of India. Returning to Scotland he was prepared for Harrow, where he entered in 1825. Two years later he was removed from school, his entire education being entrusted to the Rev. Mr Temple, incumbent of a quiet parish in Staffordshire. To this gentleman he referred in later days as having taught him all he knew, and to his training he must have owed those habits of regularity and that indomitable industry which marked his adult life. In October 1829 he passed on to Christ Church, Oxford, where he worked fairly hard, won some distinction, and made many lifelong friends. His studies, however, were so greatly interrupted by the protracted illness and death in 1832 of his only surviving brother, that Lord Ramsay, as he then became, had to content himself with entering for a "pass" degree, though the examiners marked "the high appreciation of his work" by placing him in the fourth class of honours for Michaelmas 1835. He then travelled in Italy and Switzerland, enriching with copious entries the diary which he religiously kept up through life, and storing his mind with valuable observations.

An unsuccessful but courageous contest at the general election in 1835 for one of the seats in parliament for Edinburgh, fought against such veterans as the future speaker, James Abercrombie, afterwards Lord Dunfermline, and John Campbell, future lord chancellor, was followed in 1837 by Ramsay's return to the House of Commons as member for East Lothian. In the previous year he had married Lady Susan Hay, daughter of the marquess of Tweeddale, whose companionship was his chief support in India, and whose death in 1853 left him a broken man. In 1838 his father had died after a long illness, while less than a year later he lost his mother. Succeeding to the peerage, the new earl soon made his mark in public affairs, appearing on the 16th of June 1840 in support of Lord Aberdeen's Church of Scotland Benefits Bill, a controversy arising out of the Achturander case, in which he had already taken part in the "general assembly" in opposition to Dr Chalmers. In May 1843 he became vice-president of the board of trade, Gladstone being president, and was sworn in as a member of the privy council. Succeeding Gladstone as president in 1845, he threw himself into the work during the crisis of the railway mania with such energy that his health partially broke down under the strain. In the struggle over the corn laws he ranged himself on the side of Sir Robert Peel, and after the failure of Lord John Russell to form a ministry he resumed his post at the board of trade, entering the cabinet on the retirement of Lord Stanley. When Peel resigned office in June 1846, Lord John offered Dalhousie a seat in the cabinet, an offer which he declined from a fear that acceptance might involve the loss of his seat. Another attempt to secure his services in the appointment of president of the railway board was equally unsuccessful; but in 1847 he accepted the post of governor-general of India in succession to Lord Hardinge, on the understanding that he was to be left in "entire and unuestioned possession" of his own "personal independence with reference to party politics."

Dalhousie assumed charge of his dual duties as governor-general of India and governor of Bengal on the 12th of January 1848, and shortly afterwards he was honoured with the green ribbon of the Order of the Thistle. In writing to the president of the board of control, Sir John Hobhouse, he was able to assure him that everything was quiet. This statement, however, was to be falsified by events almost before it could reach England. For on the 10th of April Vans Agnew of the civil service and Lieutenant Anderson of the Bombay European regiment, having been sent to take charge of Multan from Diwan Mulraj, were murdered there, and within a short time the Sikh troops and sardars joined in open rebellion. Dalhousie agreed with Sir Hugh Gough, the commander-in-chief, that the Company's military forces were neither adequately equipped with transport and supplies, nor otherwise prepared to take the field immediately. He also foresaw the spread of the rebellion, and the necessity that must arise, not merely for the capture of Multan, but also for the entire subjugation of the Punjab. He therefore resolutely delayed to strike, organized a strong army for operations in November, and himself proceeded to the Punjab. Despite the brilliant successes gained by Herbert Edwardes in conflict with Mulraj, and Gough's inductive victories at Ramnagar in November, at Sadulapur in December, and at Chillianwalla in the following month, the stubborn resistance at Multan showed that the task required the utmost resources of the government. At length, on the 22nd of January 1849, the Multan fortress was taken by General Whish, who was thus set at liberty to join Gough at Gujrat. Here a complete victory was won on the 21st of February, the Sikh army surrendered at Rawal Pindi, and their Afghan allies were chased out of India. For his services the earl of Dalhousie received the thanks of parliament and a step in the peerage, as marquess.

The war being now over, Dalhousie, without waiting for instructions from home, annexed the Punjab, and made provision for the custody and education of the infant maharaja. For the present the province was administered by a triumvirate under the personal supervision of the governor-general, and later, a place having been found for Henry Lawrence in Rajputana, by John Lawrence as sole commissioner. Twice did Dalhousie tour through its length and breadth, settling on the spot all matters of importance, and when he left India no province could show a better record of progress.

One further addition to the empire was made by conquest. The arrogant Burmese court at Ava was bound by the treaty of Yandabo, 1826, to protect British ships in Burmese waters, but the outrageous conduct of the governor of Rangoon towards the masters of the "Monarch" and "Champion" met with no redress from the king. Dalhousie adopted the maxim of Lord Wellesley, "that an insult offered to the British flag at the mouth of the Ganges should be resented as promptly and fully as an insult offered at the mouth of the Thames"; but, anxious to save the cost of war, he tried to settle the dispute by diplomacy. When that failed he made vigorous preparation for the campaign to be undertaken in the autumn, giving his attention to the adequate provision of rations, boat transport, and medical supplies, composing differences between the military contingents from Bengal and Madras, and between the military and naval forces employed, and conferring with General Godwin whom he had chosen to command the expedition. Martaban was taken on the 5th of April 1852, and Rangoon and Bassiein shortly afterwards. Since, however, the court of Ava showed no sign of submission, the second campaign opened in October, and after the capture of Prome and Pegu the annexation of the province of Pegu was declared by a proclamation dated the 20th of December 1853. To any further invasion of the Burmese empire Dalhousie was "earnestly opposed, being content to consolidate the Company's possessions by union with Tenasserim. By his wise policy he pacified the new province, placing Colonel Arthur Phayre in sole charge of it, personally visiting it, and establishing a complete system of telegraphs and communications.

These military operations added force to the conviction which Dalhousie had formed of the need of consolidating the Company's ill-knit possessions, and as a step in that direction he decided to apply the doctrine of "lapse," and annex any Hindu native states, created or revived by the grants of the British government, in which there was a failure of male lineal descendants, reserving for consideration the policy of permitting adoptions in other Hindu chiefships tributary and subordinate to the British government as paramount. Under the first head he recommended the annexation of Satara in January 1849, of Jaipur and Sambalpur in the same year, and of Jhansi and Nagpur in 1853. In these cases his action was approved by the home authorities, but his proposal to annex Karauli in 1849 was disallowed, while Baghat and the petty estate of Udaipur, which he had annexed in 1851 and 1852 respectively, were afterwards restored to native rule.
Other measures with the same object were carried out in the Company's own territories. Bengal, too long ruled by the governor-general or his delegate, was placed under a separate lieutenant-governor in May 1854; a department of public works was established in each presidency, and engineering colleges were provided. An imperial system of telegraphs followed; the first link of railway communication was completed in 1855; well-considered plans mapped out the course of other lines and their method of administration; the Ganges canal, which then exceeded "all the irrigation lines of Lombardy and Egypt together," was completed; and despite the cost of wars in the Punjab and Burma, liberal provision was made for metallised roads and bridges. The useless military boards were swept away; selection took the place of seniority in the higher commands; an army clothing and a stud department were created, and the medical service underwent complete reorganisation.

"Unity of authority coupled with direct responsibility" was the keynote of his policy. In nine masterly minutes he suggested means for strengthening the Company's European forces, calling attention to the dangers that threatened the English community, "a handful of scattered strangers"; but beyond the additional powers of recruitment which at his entreaty were granted in the last charter act of 1853, his proposals were shelved by the home authorities, who scented no danger and wished to avoid expense. In his administration Dalhousie vigorously asserted the control of the civil government over military affairs, and when Sir Charles Napier ordered certain allowances, given as compensation for the dearth of provisions, to be granted to the sepoys on a system which had not been sanctioned from headquarters, and threatened to repeat the offence, the governor-general found it necessary to administer such a rebuke that the hot-headed soldier resigned his command.

Dalhousie's reforms were not confined to the departments of public works and military affairs. He created an imperial system of post-offices, reducing the rates of carrying letters and introducing postage stamps. To him India owes the first department of public instruction; it was he who placed the gaols under proper inspection, abolishing the practice of branding convicts; put down the crime of meriaka or human sacrifices; freed converts to other religions from the loss of their civil rights; inaugurated the system of administrative reports; and enlarged and dignified the legislative council of India. His wide interest in everything that concerned the welfare of the country was shown in the encouragement he gave to the culture of tea, in his protection of forests, in the preservation of ancient and historic monuments. With the object of improving civil administration, he closed the useless college in Calcutta for the education of young civilians, establishing in its place a proper system of training them in munifosal stations, and subjecting them to departmental examinations. He was equally careful of the well-being of the European soldier, providing him with healthy recreations and public gardens. To the civil service he gave liberal leave and pension rules, while he purified its moral by forbidding all share in trading concerns, by vigorously punishing insolvents, and by his personal example of careful selection in the matter of patronage. As a comprehensive view of the constitution of the Indian government, dealing with the functions of its various members and the different parts of the official machinery, nothing could be more masterly than his minute of the 17th of October 1852. Indeed no governor-general ever penned a larger number of weighty papers dealing with public affairs in India. Even after laying down office and while on his way home, he forced himself, ill as he was, to review his own administration in a document of such importance that the House of Commons gave orders for its being printed (Blue Book 245 of 1856).

His foreign policy was guided by a desire to recognize the "independence" of the larger native states, and to avoid extending the political relations of his government with foreign powers outside India. Pressed to intervene in Hyderabad, he refused to do so, laying down the doctrine that interference was only justified "if the administration of native princes tends unquestionably to the injury of the subjects or of the allies of the British government." Protection in his view carried no right of interference in the affairs of what he called "independent" states. In this spirit he negotiated in 1853 a treaty with the nizam, which provided funds for the maintenance of the contingent kept up by the British in support of that prince's authority, by the assignment of the Berars in lieu of annual payments of the cost and large outstanding arrears. "The Berar treaty," he told Sir Charles Wood, "is more likely to keep the nizam on his throne than anything that has happened for fifty years to him," while at the same time the control thus acquired over a strip of territory intervening between Bombay and Nagpur promoted his policy of consolidation and his schemes of railway extension. The same spirit induced him to tolerate a war of succession in Bahawalpur, so long as the contending candidates did not violate British territory. This reluctance to increase his responsibilities further caused him to refrain from the Dost Mohammed for the part he had taken in the Sikh War, and resolutely to refuse to enter upon any negotiations until the amir himself came forward. Then he steered a middle course between the proposals of his own agent, Herbert Edwardes, who advocated an offensive alliance, and those of John Lawrence, who would have avoided any sort of engagement. He himself drafted the short treaty of peace and friendship which Lawrence signed in 1855, that officer receiving in 1856 the order of K.C.B. in acknowledgment of his services in the matter. While, however, Dalhousie was content with a mutual engagement with the Afghan chief, binding each party to respect the territories of the other, he saw that a larger measure of interference was needed in Baluchistan, and with the khan of Kalat he authorized Major Jacob to negotiate a treaty of subordinate co-operation on the 14th of May 1854. The khan was guaranteed an annual subsidy of Rs.50,000, in return for the treaty which "bound him to us wholly and exclusively." To this the home authorities demurred, but the engagement was duly ratified, and the subsidy was largely increased by Dalhousie's successors. On the other hand, he insisted on leaving all matters concerning Persia and Central Asia to the decision of the queen's advisers. The frontier tribesmen it was obviously necessary to coerce into good behaviour after the annexation of the Punjab. "The hillmen," he wrote, "regard the plains as their food and prey," and the Afridis, Mohmands, Black Mountain tribes, Waziris and others had to be taught that their new neighbours would not tolerate outrages. But he proclaimed to one and all his desire for peace, and urged upon them the duty of tribal responsibility.

The settlement of the Oudh question was reserved to the last. The home authorities had begged Dalhousie to prolong his tenure of office during the Crimean War, but the difficulties of the problem no less than complications elsewhere had induced him to delay operations. In 1854 he appointed Outram as resident at the court of Lucknow, directing him to submit a report on the condition of the province, which was furnished in March 1855. But though the state of disorder and misrule revealed by it called for prompt remedy, Dalhousie, looking at the treaty of 1801, considered that he was bound to proceed in the matter of reform with the king's consent. He proposed, therefore, to demand a transfer to the Company of the entire administration, the king merely retaining his royal rank, certain privileges in the courts, and a liberal allowance. If he should refuse this arrangement, a general rising was almost certain to follow, and then the British government would of necessity intervene on its own terms. On the 21st of November 1855 the court of directors instructed Dalhousie to assume the powers essential to the permanence of good government in Oudh, and to give the king no option unless he was sure that his majesty would surrender the administration rather than risk a revolution. Dalhousie was in wretched health and on the eve of retirement when the belated orders reached him; but he at once laid down instructions for Outram in every detail, moved up troops, and elaborated a scheme of government with particular orders as to conciliating local opinion. The king refused to sign the treaty put before
of years responsible.

Ramsay of good dictatorship, "Firoze," an object of general sympathy and not less general respect. At Alexandria he was carried by H.M.S. "Cradoc" to Malta, and thence by the "Tribune" to Spithead, which he reached on the 13th of May. His return had been eagerly looked for by statesmen who hoped that he would resume his public career, by the Company which voted him an annual pension of £500, by public bodies which showered upon him every mark of respect, and by the queen who earnestly prayed for the "blessing of restored health and strength." That blessing was not to be his. He lingered on, seeking sunshine in Malta and medical treatment at Malvern, Edinburgh and other places in vain obedience to his doctors. The outbreak of the mutiny led to bitter attacks at home upon his policy, and to strange misrepresentation of his public acts, while on the other hand John Lawrence invoked his counsel and influence, and those who really knew his work in India cried out, "Oh, for a dictator," and his return "for one hour!" To all these cries he turned a deaf ear, refusing to embarrass those who were responsible by any expressions of opinion, declining to undertake his own defence or to assist in his vindication through the public press, and by his last directions scaling up his private journal and papers of personal interest against publication until fifty years after his death. On the 9th of August 1850 his youngest daughter, Edith, was married at Dalhousie Castle to Sir James Fergusson, Bart. In the same castle Dalhousie died on the 19th of December 1860; he was buried in the old churchyard of Cockpen.

Dalhousie's family consisted of two daughters, and the marquessate became extinct at his death.

The detailed events of the period will be found in Sir William Lee-Warner's Life of the Marquis of Dalhousie, K.T.; Sir E. Arnold's Dalhousie's Administration of British India; Sir C. Jackson's Vindication of Dalhousie's Indian Administration AN. W., Dalhousie; Capt. L. J. Trotter's Life of the Marquis of Dalhousie; the duke of Argyll's India under Dalhousie and Canning; Broughton MSS. (British Museum); and parliamentary papers. (W. L.-W.)

DALHOUISIE, FOX MAULE RAMSAY, 11th Earl of (1801–1874), was the eldest son of William Ramsay Maule, 1st Baron Panmure (1717–1852), and a grandson of George, 8th earl of Dalhousie. Born on the 2nd of April 1801 and christened Fox as a compliment to the great Whig to whom he served for a term in the army, and then in 1835 entered the House of Commons as member for Perthshire. In Lord Melbourne's ministry (1835–1841) Maule was under-secretary for home affairs, and under Lord John Russell he was secretary-at-war from July 1846 to January 1852, when for two or three weeks he was president of the board of control. In April 1852 he became the 2nd Baron Panmure, and early in 1853 he joined Lord Palmerston's cabinet, filling the new office of secretary of state for war. Panmure held this office until February 1858, being at the war office during the concluding period of the Crimean War and having to meet a good deal of criticism, some of which was justified and some of which was not. In December 1860 he succeeded his kinsman, the marquess of Dalhousie, as 11th earl of Dalhousie, and he died childless on the 6th of July 1874. Always interested in church matters, Dalhousie was a prominent supporter of the Free Church of Scotland after the disruption of 1843. On his death the barony became extinct, but his earldom passed to his cousin, George Ramsay (1806–1880), an admiral who, in 1875, was created a peer of the United Kingdom as Baron Ramsay. George's grandson, Arthur George Maule Ramsay (b. 1873), became the 14th earl in 1887.

See the Panmure Papers, a selection from Panmure's correspondence, edited in two volumes (1908), by Sir G. Douglas, Bart., and Sir G. D. Ramsay. These numerous letters throw much light on the concluding stage of the Crimean War.

DALIN, OLOF VON (1708–1763), Swedish poet, was born on the 29th of August 1708 in the parish of Vinberg in Halland, where his father was the minister. He was nearly related to Rydellius, the philosophical bishop of Lund, and he was sent at a very early age to be instructed by him, Linnaeus being one of his fellow-pupils. While studying at Lund, Dalin had visited Stockholm in the year 1725, and in 1726 entered one of the public offices there. Under the patronage of Baron Rålamb he rapidly rose to preferment, and his skill and intelligence won him golden opinions. In 1733 he started the weekly Svenska Argus, on the model of Addison's Spectator, writing anonymously till 1736. His next work was an ope－nār efter Critiquer (Thoughts about Critics, 1736). With the avowed purpose of enlarging the horizon of his cultivation and tastes, Dalin set off, in company with his pupil, Baron Rålamb's son, on a tour through Germany and France, in 1739–1740. On his return the shifting of political life at home caused him to write his famous satirical allegories of The Story of the Horse and Aprilver (1738), which were very popular and provoked countless imitations. His didactic epis of Svenska Friteten (Swedish Liberty) appeared in 1742. Hitherto Addisson and Pope had been his models; in this work he draws his inspiration from Thomson, whose poem of Liberty it imitated. On the accession of Adolphus Frederick in 1751 Dalin received the post of tutor to the crown prince, afterwards Gustavus III. He had enjoyed the confidence of Queen Louisa Ulrika, sister of Frederick the Great of Germany, while she was crown princess, and she now made him secretary of the Swedish academy of literature, founded by her in 1753. His position at court involved him in the queen's political intrigues, and he was separated from her to a vexatious degree from the studies in which he had hitherto been absorbed. He held the post of tutor to the crown prince until 1756, when he was arrested on suspicion of having taken part in the attempted coup d'état of that year, and was tried for his life before the diet. He was acquitted, but was forbidden on any pretence to show himself at court. This period of exile, which lasted until 1761, Dalin spent in the preparation of the third volume of his great historical work, the Svena Rikes historier (History of the Swedish Kingdom), which came to the death of Charles X. in 1611. The first two volumes appeared in 1746–1750; the third, in two parts, in 1760–1762. Dalin had been ennobled in 1751, and made privy councilor in 1753; and now, in 1761, he once more took his place at court. During his exile, however, his spirit and his health had been broken; in a fit of panic he had destroyed some packets of his best unpublished works and this he constantly brooded over. On the 13th of August 1763 he died in his house in Drottningholm. In the year 1767 his writings in belles lettres were issued in six volumes, edited by J. C. Bökman, his half-brother. Amid an enormous mass of occasional verses, anagrams, epigrams, impromptus and the like, his satires and serious poems were almost buried. But some of these former, even, are found to be songs of remarkable grace and delicacy, and many display a love of natural scenery and a knowledge of its forms truly remarkable in that artificial age. His dramas also are of interest, particularly his admirable comedy of Den afundsjuke (The Envious Man, 1738); he also wrote a tragedy, Brynilda (1739), and a pastoral in three scenes on King Adolphus Frederick's return from Finland. During the early part of his life he was universally admitted to be facile princeps among the Swedish poets of his time.

See also K. Warburg, "Olof von Dalin," in the Handlanger (vol. lix, 1884) of the Swedish Academy. A selection of his works was edited by E. V. Lindblad (Örebro, 1872).

DALKEITH, a municipal and police burgh of Edinburghshire, Scotland, lying between the North and South Esk, 7 m. S.E.
of Edinburgh, by the North British railway. Pop. (1891) 7055; (1901) 6812. It is an important agricultural centre, and has every week one of the largest grain-markets in Scotland. Besides milling, brewing and tanning, the chief industries are the making of carpets, brushes and bricks, and iron and brass founding. Near Eskbank, a handsome residential quarter with a railway station, coal-mining is carried on. Market-gardening, owing to the proximity of the capital, flourishes. The parish church—an old Gothic edifice, which was originally the Castle chapel, and was restored in 1852—the municipal buildings, corn exchange, Foresters' hall and Newmills hospital are among the principal public buildings. Dalkeith was the birthplace of Professor Peter Guthrie Tait, the mathematician (1831-1901). Dalkeith Palace, a seat of the duke of Buccleuch, was designed by Sir John Vanbrugh in 1700 for the widow of the duke of Monmouth, countess of Buccleuch in her own right. It occupies the site of a castle which belonged first to the Grahams and afterwards to the Douglases, and was sold in 1642 by William, seventh or eighth earl of Morton, to Francis, second earl of Buccleuch, for the purpose of raising money to assist Charles I. in the Civil War. The palace has been the residence of several sovereigns different nationalities, and is among them George IV., in 1822, Queen Victoria in 1845, and Edward VII. in 1901. The picture gallery possesses important examples of the Old Masters; the gardens are renowned for their fruit and flowers; and the beautiful park of over 1000 acres—containing a remnant of the Caledonian Forest, with oaks, beeches and ashes of great girth and height—is watered by the North and South Esk, which unite before they leave the policy. About 1 m. south is Newbattle Abbey, the seat of the marquess of Lothian, delightfully situated on the South Esk. It is built on the site of an abbey founded by David I., the ancient crypt being incorporated in the mansion. The library contains many valuable books and illuminated MSS., and excellent pictures and carvings. In the park are several remarkable trees, among them one of the largest beeches in the United Kingdom. Two miles still farther south lies Cockpen, immortalized by the Baroness Nairne's humorous song "The Laird of Cockpen," and Dalhouse Castle, partly ancient and partly modern, which gives a title to the earls of Dalhousie. About 6 m. south-east of Dalkeith are Borthwick and Crichton castles, 1 m. apart, both now in ruins. Queen Mary spent three weeks in Borthwick Castle, as in durance vile, after her marriage with Bothwell, and fled from it to Dunbar in the guise of a page. The castle, which is a double tower, was besieged by Cromwell, and the marks of his cannon-balls are still visible. In the manse of the parish of Borthwick, William Robertson, the historian, was born in 1721. About 4 m. west of Dalkeith is the village of Burdichouse, the limestone quarries of which are famous for fossils. The name is said to be a corruption of Bordehouse House, which was bestowed on it by Queen Mary's French servants, who lived here when their mistress resided at Craigmillar.

DALKEY, a small port and watering-place of Co. Dublin, Ireland, in the south parliamentary division; 9 m. S.E. of Dublin by the Dublin & South-Eastern railway. Pop. of urban district (1901), 3308. It is pleasantly situated on and about Sorrento Point, the southern horn of Dublin Bay. Dalkey Island, lying off the town, has an ancient church chapel, of the history of which nothing is certainly known, and a disused battery, which protected the harbour, a landing-place of some former importance. A castle in the town, of the 15th century, is restored to use as offices for the urban district council. There are also ruins of an old church, the dedication of which, like the island chapel, is ascribed to one St Begnet, perhaps a diminutive form of Bega, but the identity is not clear. Until the close of the 18th century Dalkey was notorious for the burlesque election of a “king,” a mock ceremony which became invested with a certain political importance.

DALLAS, ALEXANDER JAMES (1759-1817), American statesman and financier, was born on the island of Jamaica, West Indies, on the 21st of June 1759, the son of Dr Robert C. Dallas (d. 1774), a Scottish physician then practising there. Dr Dallas soon returned to England with his family, and Alexander was educated at Edinburgh and Westminster. He studied law for a time in the Inner Temple, and in 1780 returned to Jamaica. There he met the younger Lewis Hallam (1738-1808), a pioneer American theatrical manager and actor, who induced him to remove to the United States, and in 1783 he settled in Philadelphia, where he at once took the oath of allegiance to the United States, was admitted to practise law in 1785, and rapidly attained a prominent position at the bar. He was interested in the theatrical projects of Hallam, for whom he wrote several dramatic compositions, and from 1787 to 1789 he edited The Columbian Magazine. From 1791 to 1801 he was secretary of the commonwealth of Pennsylvania. Partly owing to his publication of an able pamphlet against the Jay treaty in 1795, he soon acquired a position of much influence in the Democratic-Republican party in the state. During the Whisky Insurrection he was paymaster-general of the state militia. His official position as secretary did not entirely prevent him from continuing his private law practice, and, with Jared Ingersoll, he was the counsel of Senator William Blount in his impeachment trial. Dallas was United States attorney for the Southern district of Pennsylvania from 1801 until 1814, a period marked by bitter struggle between Democratic-Republican factions in the state, in which he took a leading part in alliance with Governor Thomas McKean and Albert Gallatin, and in opposition to the radical factions led by Michael Leib (1759-1822) and William Duane (1760-1835), of the Aurora. The quarrel led in 1805 to the McKean party seeking Federalist support. By such an alliance, largely due to the political ingenuity of Dallas, McKean was re-elected. In October 1814 President Madison appointed Dallas secretary of the treasury, to succeed George W. Campbell (1768-1848), whose brief and disastrous term had been marked by wholesale bank suspensions, and an enormous deprecation of state and national bank notes. The appointment itself inspired confidence, and Dallas's prompt measures still further relieved the situation. He first issued new interest-bearing treasury notes of small denominations, and in addition proposed the re-establishment of a national bank, by which means he expected to increase the stability and uniformity of the circulating medium, and furnish the government power to purchase national debt and to sell state securities. In spite of his already onerous duties, Dallas, with unerring energy, served also as secretary of war ad interim from March to August 1815, and in this capacity successfully reorganized the army on a peace footing. Although peace brought a more favourable condition of the money market, Dallas's attempt to fund the treasury notes on a satisfactory basis was unsuccessful, but a bill, reported by Calhoun, as chairman of the committee on national currency, for the establishment of a national bank, became law on the 10th of April 1816. Meanwhile (12th of February 1816) Dallas, in a notable report, recommended a protective tariff, which was enacted late in April, largely in accordance with his recommendation. Although Dallas left the cabinet in October 1816, it was through his efforts that the new bank began its operations in the following January, and specie payments were resumed in February. Dallas, who belonged to the financial school of Albert Gallatin, deserves to rank among America's greatest financiers. He founded the government banks, and, after two years at the head of the treasury he left it with a surplus of $30,000,000; moreover, as Henry Adams points out, his measures had "fixed the financial system in a firm groove for twenty years." He retired from office to resume his practice of the law, but the burden of his official duties had undermined his health, and he died suddenly at Philadelphia on the 16th of June 1817. He was the author of several notable political pamphlets and state papers, and in addition edited The Laws of Pennsylvania, 1700-1801 (1801), and Reports, of Cases ruled and adjudged by the Courts of the United States and of Pennsylvania before and since the Revolution (4 vols., 1796-1807; new edition with notes by Thomas J. Wharton, 1830). He wrote An Exposition of the Causes and Character of the War of 1812-15 (1819), which was republished
by government authority in New York and London and widely circulated. He left in MS an unfinished History of Pennsylvania.

His brother, Robert Charles Dallas (1754-1824), was born in Jamaica, and lived at various times in the West Indies, the United States, England, and France. He was an intimate friend of Lord Byron. He wrote Recollections of Lord Byron (1824), and several novels, plays and miscellaneous works.

See G. M. Dallas, Life and Writings of Alexander James Dallas (Philadelphia, 1871).

Dallas, George Mifflin (1792-1864), American statesman and diplomat, was born in Philadelphia, Pennsylvania, on the 10th of July 1792. He graduated at Princeton in 1810 at the head of his class; then studied law in the office of his father, Alexander J. Dallas, the financier, and was admitted to the bar in 1813. In the same year he accompanied Albert Gallatin, as his secretary, to Russia, and in 1814 returned to the United States as the bearer of important dispatches from the American peace commissioners at Ghent. He practised law in New York and Philadelphia, was chosen mayor of Philadelphia in 1828, and in 1829 was appointed by President Jackson, whom he had twice warmly supported for the presidency, United States attorney for the eastern district of Pennsylvania, a position long held by his father. From 1831 to 1833 he was a Democratic member of the United States Senate, in which he advocated a compromise tariff and strongly supported Jackson's position in regard to nullification. On the bank question he was at first at variance with the president; in January 1832 he presented in the Senate a memorial from the bank's president, Nicholas Biddle, and its managers, praying for a recharter, and subsequently he was chairman of a committee which reported a bill re-chartering the institution for a fifteen-year period. Afterwards, however, his views changed and he opposed the bill. From 1833 to 1835 Dallas was attorney-general of Pennsylvania, and from 1835 to 1836 was minister to Russia. During the following year he was engaged in a long struggle with James Buchanan for party leadership in Pennsylvania. He was vice-president of the United States from 1845 to 1849, but the appointment of Buchanan as secretary of state at once shut him off from all hope of party patronage or influence in the Polk administration, and he came to be looked upon as the leader of that body of conservative Democrats of the North, who, while they themselves chafed at the domination of Southern leaders, were disposed to disapprove all anti-slavery agitation. By his casting vote at a critical period during the debate in the Senate on the tariff bill of 1846, he irretrievably lost his influence with the protectionist element of his native state, to whom he had given assurances of his support of the Tyler tariff of 1842. For several years after his retirement from office, he devoted himself to his law practice, and in 1856 succeeded James Buchanan as United States minister to England, where he remained until relieved by Charles Francis Adams in May 1861. During this trying period he represented his country with ability and tact, making every endeavour to strengthen the Union cause in Great Britain. He died at Philadelphia on the 1st of December 1864. He wrote a biographical memoir for an edition of his father's writings, which was published in 1871.

His Diary of his residence in St Petersburg and London was published in Philadelphia in 1892.

Dallas, a city in the county-seat of Dallas county, Texas, U.S.A., about 220 m. N.W. of Houston, on the E. bank of the Trinity river. Pop. (1880) 10,358; (1890) 38,67; (1900) 42,638, of whom 9035 were negroes and 3381 were foreign-born; (1910) 92,104. Area, about 15 sq. m. Dallas is served by the Chicago, Rock Island & Pacific, the Gulf, Colorado & Santa Fé, the Houston & Texas Central, the Missouri, Kansas & Texas, the St Louis South-western, the Texas & New Orleans, the Trinity & Brazos Valley, and the Texas & Pacific railways, and by interurban electric railways to Fort Worth and Sherman. The lower channel of the Trinity river has been greatly improved by the Federal government; but in 1908 the river was not navigable as far as Dallas. Among public buildings are the Carnegie library (1901), Dallas county court house, the city hall, the U.S. government building, St Matthew's cathedral (Prot. Episc.), the cathedral of the Sacred Heart (Rom. Cath.), the city hospital, St Paul's Sanitarium (Rom. Cath.), and the Baptist Memorial Sanitarium. Educational institutions include Dallas Medical College (1891), the College of Medicine and Pharmacy of Baylor University, the medical college of South-western University (at Georgetown, Texas), Oak Cliff female academy, Patton Seminary, St Mary's female college (Prot. Episc.), and Holy Trinity college (Rom. Cath.). The city had in 1908 three parks—Bachman's Reservoir (500 acres); Fair (535 acres)—the Texas state fair grounds, in which an annual exhibition is held— and City park (17 acres). Lake Cliff, Cycle and Oak Lawn parks are amusement grounds. A Confederate soldiers monument, a granite shaft 50 ft. high, was erected in 1897, with statues of R. E. Lee, Jefferson Davis, "Stonewall" Jackson and A. S. Johnston. Dallas was in 1900 the third city in population and the most important railway centre in Texas. It is a shipping centre for a large wheat, fruit and tobacco region, and the principal jobbing market for northern Texas, Oklahoma and part of Louisiana, and the biggest distributing point for agricultural machinery in the South-west. It is a livestock market, and one of the chief centres in the United States for the manufacture of saddlery and leather goods, and of cotton-gin machinery. It has flour and gist mills (the products of which ranked first in value among the city's manufactures in 1905), wholesale slaughtering and meat-packing establishments, cooperage works, railway repair shops, cotton compresses, lumber yards, salt works, manufactories of cotton-seed oil and cake, boots and shoes and cotton and agricultural machinery. In 1900 and 1905 it was the principal manufacturing centre in the state, the value of its factory product in 1905 being $15,075,608, an increase of 64.7% over that in 1900. The water works are owned and operated by the city, and the water is taken from the Elm fork of the Trinity river. There are several artesian wells. Dallas was first chartered as a city in 1856. The city is governed, under a charter of 1907, by a mayor and four commissioners, who together pass ordinances, appoint nearly all city officers, and generally are responsible for administering the government. In addition a school board is elected by the people. The charter contains initiative and referendum provisions, provides for the recall of any elective city official, and prohibits the granting of any franchise for a longer term than twenty years.

Dallas, John (1779-1862), American statesman, was born at Springville, Utah, on the 22nd of November 1861. He was a pupil of Truman H. Bartlett in Boston, of the Ecole des Beaux Arts, the Académie Julienne and the sculptors Henri M. Chapu and Jean Dampf (born 1858), in Paris, and on his return to America became instructor in modelling in the state normal art school in Boston. He is best known for his plastic representations of the North American Indian—especially for "The Signal of Peace" in Lincoln Park, Chicago, and "The Medicine Man," in Fairmount Park, Philadelphia. As a boy he had lived among the Indians in the Far West, and had learned their language. His later works include "Pioneer Monument," Salt Lake City; Sir Isaac Newton," Congressional Library, Washington; and "Don Quixote." He won a silver medal at the Paris Exposition, 1900, Fladley gold medal at the St Louis Exposition, 1904.

Dalling and Bulwer, William Henry Lytton Earle Bulwer, Baron (1801-1879), better known as Sir Henry Bulwer, English diplomatist and author, was born in London on the 13th of February 1801. His father, General William Earle Bulwer, when colonel of the 160th regiment, had married Elizabeth Barbara Lytton, who—as the only child
of Richard Warburton Lytton, of Knebworth Park, in Hertfordshire—was sole heiress of the family of Norreys-Robinson-Lytton of Monackpu in the island of Anglesea and of Guernsay in Denbgshire. Three sons were the fruit of this marriage.

The second, afterwards Lord Dalling, was amply provided for by his selection as heir to his maternal grandmother; the paternal estates in Norfolk went to his elder brother William, and the maternal property in Herts to the youngest, Edward, known first as Bulwer the novelist and dramatist, and afterwards as the first Baron Lytton (q.v.) of Knebworth.

General Bulwer, as brigadier-general of volunteers, was one of the four commanding officers to whom was entrusted the defence of England in 1804, when threatened with invasion by Napoleon. Three years afterwards, on the 7th of July 1807, he died prematurely at fifty-two at Heydon Hall. His young widow had then devolved upon her not only the double charge of caring for the estates in Herts and Norfolk, but the far weightier responsibility of superintending the education of her three sons, then in their earliest boyhood. Henry Bulwer was educated at Harrow, under Dr George Butler, and at Trinity College and Downing College, Cambridge. In 1822 he published a small volume of verse, beginning with an ode on the death of Napoleon. It is chiefly interesting now for its fraternal dedication to Edward Lytton Bulwer, then a youth of nineteen.

On leaving Cambridge in the autumn of 1824, Henry Bulwer went, as emissary of the Greek committee then sitting in London, to the Morea, carrying with him £80,000 sterling, which he handed over to Prince Mavrocordato and his colleagues, as the responsible leaders of the War of Independence. He was accompanied on this expedition by Hamilton Browne, who, a year before, had been despatched by Lord Byron to Cephalonia to treat with the insurgent government. Shortly after his return to England in 1826, Bulwer published a record of this excursion, under the title of An Autumn in Greece. Meanwhile, bent for the moment upon following in his father's footsteps, he had, on the 19th of October 1825, been gazetted as a cornet in the 2nd Life Guards. Within less than eight months, however, he had exchanged from cavalry to infantry, being enrolled on the 2nd of June 1826 as an ensign in the 58th regiment. That ensigncy he retained for little more than a month, obtaining another unattached, which he held until the 1st of January 1829, when he finally abandoned the army. The court, not the camp, was to be the scene of his successes; and for thirty-eight years altogether, from August 1827 to August 1865—he contrived, while not sitting from a young attaché to an astute and veteran ambassador, to hold his own with ease, and in the end was ranked amongst the stillest intellects of his time as a master of diplomacy. His first appointment in his new profession was as an attaché at Berlin. In April 1830 he obtained his next step through his nomination as an attaché at Vienna. Thence, exactly a year afterwards, he was employed nearer home in the same capacity at the Hague.

As yet ostensibly no more than a careless loungier in the salons of the continent, the young ex-cavalry officer veiled the keenest observation under an air of indifference. His constitutional energy, which throughout life was exceptionally intense and tenacious, wore from the first a mask of languor. When in reality most cautious he was seemingly most negligent. No matter what he happened at the moment to take in hand, the art he applied to it was always that highest art of all, the aedre serre arm. His mastery of the lightest but most essential weapon in the armoury of the diplomatist, tact, came to him as it seemed intuitively, and from the outset was consummate. Talleyrand himself would have had no reason, even in Henry Bulwer's earliest years as an attaché, to write entreatingly, "ser de zile," to one who concealed so felicitously, even at starting, a lynx-like vigilance under an aspect the most phlegmatic. He had hardly reached his new post at the Hague when he found and seized his opportunity. The revolutional explosion of July at Paris had been echoed on the 25th of August 1830 by an outburst of insurrection at Brussels. During the whole of September a succession of stormy events swept over Belgium, until the popular rising reached its climax on the 4th of October in the declaration of Belgian independence by the provisional government. At the beginning of the revolution, the young attaché was despatched by the then foreign secretary at Whitehall, Lord Aberdeen, to watch events as they arose and report their character. In the execution of his special mission he traversed the country in all directions amidst civil war, the issue of which was to the last degree problematic. Under those apparently bewildering circumstances, he was enabled by his sagacity and penetration to win his spurs as a diplomatist.

Writing almost haphazard in the midst of the conflict, he sent home from day to day a series of despatches which threw a flood of light upon incidents that would otherwise have appeared almost inexplicable. Scarcely a week had elapsed, during which his predictions had been wonderfully verified, when he was summoned to London to receive the congratulations of the cabinet. He returned to Brussels no longer in a merely temporary or informal capacity. As secretary of legation, and afterwards as chargé d'affaires, he assisted in furthering the negotiations out of which Belgium rose into a kingdom. Scarcely had this been accomplished when he wrote what may be called the first chapter of the history of the newly created Belgian kingdom. It appeared in 1831 as a brief but luminous paper in the January number of the Quarterly Review. As the events it recorded had helped to inaugurate her writer's career as a diplomatist, so did his narrative of those occurrences in the pages of the Radical quarterly signalize in a remarkable way the commencement of his long and consistent career as a Liberal politician. Shortly before his appearance as a reviewer, and immediately prior to the carrying of the first Reform Bill, Bulwer had won a seat in the House of Commons as member for Wilton, afterwards in 1831 and 1832 sitting there as M.P. for Coventry. Nearly two years having elapsed, during which he was absent from parliament, he was in 1834 returned to Westminster as member for Marylebone. That position he retained during four sessions, winning considerable distinction as a debater. Within the very year in which he was chosen by the Marylebone electors, he brought out in two volumes, entitled France—Literary, Social and Political, the first half of a work which was only completed upon the publication, two years afterwards, of a second series, also in two volumes, under the title of The Monarchy of the Middle Classes. Through its pages he made good his claim to be regarded not merely as a keen-witted observer, but as one of the most sagacious and genial delineators of the generic Frenchman, whose type he is. And as the events he recorded in his life he especially delighted to hold familiar intercourse, the true Parisian. Between the issuing from the press of these two series, Henry Bulwer had prefixed an intensely sympathetic Life of Lord Byron to the Paris edition of the poet's works published by Galilani,—a memoir republished sixteen years afterwards.

A political argument of a curiously daring and outspoken character, entitled The Lords, the Government, and the Country, was given to the public in 1836 by Bulwer, in the form of an elaborate letter to a constituent. At this point his literary labours, which throughout life were with him purely labours by-the-way, ceased for a time, and he disappeared during three decades from authorship and from the legislature.

During the period of his holding the position of chargé d'affaires at Brussels, Bulwer had seized every opportunity of making lengthened sojourns at Paris, always for him the choicest place of residence. It was in the midst of one of these dolce per niente loiterings on the boulevards that, on the 14th of August 1837, he received his nomination as secretary of embassy at Constantinople. Recognizing his exceptional ability Lord Ponsonby, the British ambassador at Constantinople, at once entrusted to him the difficult task of negotiating a commercial treaty, which had the double object of removing the intolerable conditions which hampered British trade with Turkey and of dealing a blow at the threatening power of Mehemet Ali, pasha of Egypt, by shattering the system of monopolies on which it was largely based. In this difficult task Bulwer was helped by the hatred of Sultan Mahmud II. for Mehemet Ali, but the treaty was none the less a remarkable
proof of his diplomatic skill, and the compliment was well deserved when Palmerston, in writing his congratulations to him from Windsor Castle, on the 13th of September 1838, pronounced the treaty a capo d’opera, adding that without reserve it would be at once ratified. Shortly after this achievement Bulwer was nominated secretary of embassy at St. Petersburg. Illness, however, compelled him to delay his northern journey—almost opportunely, as it happened, for in June 1839 he was despatched, in the same capacity, to the more congenial atmosphere of Paris. At that juncture the developments of the feud between Mehemet Ali and the Porte were threatening to bring England and France into armed collision (see MEHEMET ALI). In 1839 and 1840, during the temporary absence of his chief, Lord Granville, the secretary of embassy was gazetted ad interim chargé d'affaires at the court of France, and thus during this critical time he had fresh opportunities of winning distinction as a diplomatist.

On the 14th of November 1843 he was appointed ambassador at the court of the young Spanish queen Isabella II. Upon his arrival at Madrid signal evidence was afforded of the estimation in which he was then held as a diplomatist. He was chosen arbitrator between Spain and Morocco, then confronting each other in deadly hostility, and, as through the medium of his mediation, a treaty of peace was signed, the estrangement between the two powers was ended in 1844. In 1848 a more formidable difficulty arose,—one which, after threatening war between France and England, led at last to a diplomatic rupture between the British and Spanish governments. The dynastic intrigues of Louis Philippe were the immediate cause of this estrangement, and those intrigues found their climax in what has ever since been known in European annals as the Spanish Marriages. The storm sown in the Spanish marriages was reaped in the whirlwind of the February revolution. And the explosion which took place at Paris was answered a month afterwards at Madrid by a similar outbreak. Marshal Narvaez thereupon assumed the dictatorship, and wreaked upon the insurgents a series of reprisals of the most pitiless character. These excessive severities of the marshal-dictator the British ambassador did his utmost to mitigate. When at last, however, Narvaez carried his rigour to the length of summarily suppressing the constitutional guarantees, Bulwer sent in a formal protest in the name of England against an act so entirely ruthless and unjustifiable. This courageous proceeding on Bulwer’s part led to the British government taking steps towards an interdict upon it, which was unprecedented. Narvaez, with matchless effrontery, denounced the ambassador from England as an accomplice in the conspiracies of the Progressistas; and despite his position as an envoy, and in insolent defiance of the Palmerstonian boast, César Britannicus, Bulwer, on the 12th of June, was summarily required to quit Madrid within twenty-four hours. Two days afterwards M. Istruzzi, the Spanish ambassador at the court of St. James’s, took his departure from London. Diplomatic relations were not restored between the two countries until years had elapsed, nor even then until after a formal apology, dictated by Lord Palmerston, had been signed by the prime minister of Queen Isabella. Before his return the ambassador was gazetted a K.C.B., being promoted to the grand cross some three years afterwards. In addition to this mark of honour he received the formal approbation of the ministry, and with it the thanks of both Houses of Parliament.

Before the year of his return from the peninsula had run out Sir Henry Bulwer was married to the Hon. Georgiana Charlotte Mary Wellesley, youngest daughter of the 1st Baron Cowley, and niece of the Duke of Wellington. Early in the following year, on the 27th of April 1849, he was nominated ambassador at Washington. There he acquired immense popularity. His principal success was the compact which he made with the Clayton-Bulwer Treaty (q.v.), ratified in May 1850, pledging the contracting governments to respect the neutrality of the meditated ship canal through Central America, bringing the waters of the Atlantic and Pacific into direct communication. After having been accredited as ambassador to the United States for three years, Sir Henry Bulwer, early in 1852, was despatched as minister plenipotentiary at the court of the grand duke of Tuscany at Florence. Shortly after his retirement from that post in the January of 1855, he was entrusted with various diplomatic missions, in one of which he was empowered as commissioner under the 23rd article of the treaty of Paris, 1856, to investigate the state of things in the Danubian principalities, with a view to their definite reorganization. Finally he was installed, from May 1858 to August 1865, as the immediate successor, after the close of the Crimean war, of the “Great Elchi,” Viscount Stratford de Redcliffe, as ambassador extraordinary to the Ottoman Porte at Constantinople.

In the winter of 1865 Bulwer returned home from the Bosphorus, and retired with a pension. He was elected member for Tamworth on the 17th of November 1866, and retained his seat until gazetted as a peer of the realm on the 21st of March 1871, under the title of Baron Dallung and Bulwer of Wood Dalling in the county of Norfolk. Upon the eve of his return to his old haunts as a debater and a politician he had asserted his claim to literary distinction by giving to the world in two volumes his four masterly sketches of typical men, entitled Historical Characters. This work, dedicated to his brother Edward, in testimony of the writer’s veneration and respect, portrayed in a luminous outline Talleyrand the Politic Man, Cobbe the Contentious Man, Canning the Brilliant Man, and Mackintosh the Man of Promise. Two other kindred sketches, those of Sir Robert Peel and Viscount Melbourne, having been selected from among his author’s papers, were afterwards published posthumously.

Another work of ampler outline and larger pretension was begun and partially issued from the press during Lord Dallung’s lifetime, but not completed. This was the Life of Viscount Palmerston, the first two volumes of which were published in 1870. A third volume appeared four years afterwards. Even then it left the story of the English statesman broken off so abruptly that the work remained at the last the merest fragment. It was completed by Evelyn Ashley.

Lord Dallung died unexpectedly on the 23rd of May 1872 at Naples. He had no issue, and the title became extinct. In his public career he enjoyed a three-fold success—as ambassador, as politician and as man of letters. His popularity in society was at all times remarkable, mainly no doubt from his mastery of all the subtle arts of a skilful conversationalist. The apparent glibness with which he related an anecdote, flung off a bon mot, or indulged in a momentary stroke of irony imparted interest to the narrative, wings to the wit and point to the sarcasm in a manner peculiarly his own.

(D. K.)

DALLMEYER, JOHN HENRY (1830-1883), Anglo-German optician, was born on the 6th of September 1830 at Locext, Westphalia, the son of a landowner. On leaving school at the age of sixteen he was apprenticed to an Osnabrück optician, and in 1851 he came to London, where he obtained work with an optician, W. Hewitt, who shortly afterwards, with his workmen, entered the employment of Andrew Ross, a lens and telescope manufacturer. Dallmeyer’s position in this workshop appears to have been an unpleasant one, and led him to take, for a time, employment as French and German correspondent for a commercial firm. After a year he was, however, re-engaged by Ross as scientific adviser, and was entrusted with the testing and finishing of the highest class of optical apparatus. This appointment led to his marriage with Ross’s second daughter, Hannah, one of the great coffee-остью, at Ross’s death (1850), of a third of his employer’s large fortune and the telescope manufacturing portion of the business. Turning from astronomical work to the making of photographic lenses (see Photography), he introduced improvements in both portrait and landscape lenses, in object-glasses for the microscope and in condensers for the optical lantern In connexion with celestial photography he constructed photo-heliographs for the Wilna observatory in 1863, for the Harvard College observatory in 1864, and, in 1873, several for the British government. Dallmeyer’s instruments achieved a wide success in Europe and America, taking the highest awards at various international exhibitions. The Russian government gave him the order of St Stanislaus, and the French government made him chevalier of the Legion of Honour. He was for many
years upon the councils of both the Royal Astronomical and Royal Photographic societies. About 1850 he was advised to give up the personal supervision of his workshops, and to travel for a while on his health; he died on board ship, off the coast of New Zealand, on the 30th of December 1883.

His second son, Thomas Rudolphus Dallmeyer (1850–1906), who assumed control of the business on the failure of his father’s health, was principally known as the first to introduce telephotographic lenses into ordinary practice (patented 1891), and he was the author of a standard book on the subject (Telephoto-Graphy, 1890). He served as president of the Royal Photographic Society in 1900–1903.

**DALL’ ONGARO, FRANCESCO** (1808–1873), Italian writer, born in Friuli, was educated for the priesthood, but abandoned his orders, and taking to political journalism founded the Farvila at Trieste in the Liberal interest. In 1848 he enlisted under Garibaldi, and next year was a member of the assembly which proclaimed the republic in Rome, being given by Mazzini the direction of the Monitor officiale. On the downfall of the republic he fled to Switzerland, then to Belgium and later to France, taking a prominent part in revolutionary journalism; it was not till 1863 that he returned to Italy, where he was appointed professor of dramatic literature at Florence. Subsequently he was transferred to Naples, where he died on the 10th of January 1873. His patriotic poems, Stornelli, composed in early life, had a great popular success; and he produced a number of plays, notably Fornaretto, Bianca Capello, Fusco and Il Tesoro. His collected Fantasie drammatiche e liriche were published in his lifetime.

**DALMATIA** (Ger. Dalmatien; Ital. Dalmazia; Serbo-Croatian, Dalmacija), a kingdom and crownland of the Austro-Hungarian empire, in the north-west of the Balkan Peninsula, and on the Adriatic Sea. Dalmatia is bounded, on the landward side, by Croatia and Bosnia, in the N. and N.E.; and by Herzegovina and Montenegro, in the S.E. and S. Its area amounts to 4923 sq. m.; its greatest length, from north-west to south-east, is 210 m.; its breadth reaches 35 m. between Point Planca and the Bosnian frontier, diminishing to less than 1 m. at Cattaro. Near the ports of Klek and Castelnuovo the Herzegovinian frontier comes down to the sea, but only for a total distance of 143 m.

**Physical Features.**—No part of the Mediterranean shore, except the coast of Greece, is so deeply indented as the Dalmatian littoral, with its multitude of rock-bound bays and inlets. It is sheltered from the open sea by a rampart of islands which vary greatly in size; a few being large enough to support several thousand inhabitants, while others are mere reefs, swept bare by the sea, or tenanted only by rabbits and seabirds. This Dalmatian archipelago, separated from the Istrian by the Gulf of Quarnerolo, forms two island groups, the northern or Liburnian, and the southern; with open water intervening, off Point Planca. In calm weather the channels between the islands and the mainland resemble a chain of landlocked lakes, brilliantly clear to a depth of several fathoms. As a rule, the surrounding hills are rugged, bleak, almost white or pale russet, and destitute of verdure; but their monopoly is relieved by the half-ruined castles and monasteries clinging to the rocks, or by the beauty of such cities as Ragusa, or Arbe, with its curiously-stoned church on the hill overlooking the beach. The principal islands, Arbe, Bracza, Curzola, Lacroma, Lesina, Issa and Meleda, are described under separate headings. The promontory of Sabboncello, or Funtana di Stagno, which juts out for 41 m. into the sea, between Curzola and Lesina, is another island; for its breadth, which nowhere exceeds 5 m., dwindles to about 1 m. at the narrow isthmus which unites it with the shore. There are two small ports on this isthmus—on the south, Stagno Grande

1 This arrangement is based on the terms of the peace of Carlwitz 1899 (articles IX and XI of the Turco-Venetian Treaty). It is due to the commercial and maritime rivalry between Venice and Ragusa. The Ragusans bribed the Turkish envoys at Carlwitz to stipulate for a double extension of the Ottoman dominions down to the Adriatic: and thus the Ragusan lands, which otherwise would have bordered upon the Dalmatian possessions of Venice, were surrounded by neutral territory.

(Serbo-Croatian, Slon Veliki), once celebrated for its salt and ship-building industries, and, on the north, Stagno Piccolo (Slon Mali). Dalmatia possesses a magnificent anchorage in the Bocche di Cattaro, and there are numerous lesser havens, at Sebenico, Traù, Zara and elsewhere along the coast and among the islands.

The country is almost everywhere hilly or mountainous. On the Croatian border rises the lofty barrier of the Velebit, which culminates in Sveti Brdo (5751 ft.), and Vakanski Vrh (5768 ft.). The Dinaric Alps form the frontier between Dalmatia and Bosnia; Dinara (6007 ft.), which gives its name to the whole chain, and Troglov (6276 ft.), being the highest Dalmatian summits. North-west of Sinj rise the Svilaja and Moseć Planinas; the ridges of Mosor and Biokovo, with Sveti Juraj (5781 ft.), follow the windings of the coast from Spalato to Macarsca; Orjen marks the meeting-place of the Herzegovinian, Montenegrin and Dalmatian frontiers, and the Sutorman range appears in the extreme south. The barren dry limestone of the Dalmatian highlands has been aptly compared with a petrified sponge: for it is honeycombed with underground caverns and water-courses, in which the rainwater is once filtered through. This arises a complex system of subterranean rivers, with waterfalls, lakes, and regular seasons of flood. Even the few surface rivers vanish and emerge again at intervals. The Trebinjica, for instance, disappearing in Herzegovina, supplies both the broad and swift estuary of Ombla, near Ragusa, and the fresh-water spring of Doli, which issues from the bottom of the sea. Apart from the Ombla, and the Narenta (Serbo-Croatian, Neretva; Italian, Naro), which creates a broad marshy delta between Metković and the sea, Dalmatia has only three rivers more than 25 m. long; the Zermagna (Zrmanja, Tedanum), Kerka, (Kerka, Titus), and Cetina (Cetina; Narona or Titurus). The Zermagna skirts the southern foothills of the Velebit and falls into the harbour of Novigrad. Better known is the Kerka, which rises in the Dinaric Alps and flows south-westward to the Adriatic. Near Scardona (Skradin) it spreads into a broad lake, and forms several fine waterfalls, after receiving its tributary the Cicola (Cikola), from the east. South of Spalato, the Cetina, which also supplies the Dinaric Alps, descends to the sea at Almissa (Omili), after passing between the Mosor and Biokovo ranges. There are a few small lakes near Zara, Zavrecchia and the Narenta estuary; while the fertile, but unhealthy, hollows among the mountains fill with water after heavy rain, and sometimes cause disastrous floods. But most parts of the country suffer from drought.

For an account of the chief geological formations see Balkan Peninsula. Small quantities of iron, lignite, asphalt and bay salt are the only minerals of commercial importance.

The climate is warm and healthy, the mean temperature at Zara being 57°F., at Lesina 62°, and at Ragusa 63°. The prevailing wind is the sirocco, or S.E.; but the terrible Bora, or N.N.E., may blow at any season of the year. The average annual rainfall is about 28 in., but a dry and a wet year usually alternate.

**Fauna.**—Bears, badgers and wild cats, with a larger number of wolves and foxes, find shelter in the Dinaric Alps and on the heights of Svilaja, Mosor, and Biokovo; while jackals exist on Curzola and Sabboncello, almost their last refuges in Europe. Roe-deer are uncommon, and the wild boar, chamois, red-deer and beaver are extinct; but hares and rabbits abound. The game-laws are not strict, and are often evaded by the Morlachs; but moderate sport may be obtained in the fens formed by the Cetina about Sinj, and the lagoons of the Narenta estuary; both regions being frequented by wild swans, geese, duck, snipe and other aquatic birds. Among land-birds, the commonest are quails, woodcock, partridges, and especially the so-called "stone-owl" (Steinhuhn, Perdix Gracco). Tortoises are numerous; snakes, lizards, scorpions and innumerable sand-flies infest the dry hillsides; and the limestone caverns are peopled by sightless bats, reptiles, fish, flies, beetles, spiders, crustacea and molluscs.

**Fisheries.**—No region of Europe is richer in its marine fauna and flora. Sponges and coral fisheries afford a valuable source of
Income to the peasantry, many of whom also go northward for the sardine and tuna fisheries of the Istrian coast, while salmon, trout and eels are caught in the Dalmatian rivers.

**Flora.**—The olive, almond, fig, orange, palm, aloes, myrtle, locust-tree and other characteristic members of the Mediterranean flora thrive in the sheltered valleys of the Dalmatian littoral, where almond-blossoms appear in mid-winter, and the palm occasionally bears ripe fruit. The *marasca,* or wild cherry, is abundant, and yields the celebrated liqueur called *maraschino.* But at a little distance from the rivers and on the more exposed parts of the coast the aspect of the country changes entirely. Patches of thin grass, heather, juniper, thyme, tamarisks and mountain roses hardly relieve the barrenness and aridity of the seaside slopes.

**Forests.**—Oaks, pines and beeches still, in a few parts, clothe the landward slopes, but, as a rule, the forests for which Dalmatia was once famous were cut down for the Venetian shipyards or burned by pirates; while every attempt at replanting is frustrated by the shallowness of the soil, the drought and the multitude of goats that browse on the young trees.

**Agriculture.**—Little more than one-tenth of the whole surface is under the plough; the rest, where it is not altogether sterile, being chiefly mountain pasture, vineyards and garden land. Asses are the favourite beasts of burden; goats are strikingly numerous; and sheep are kept for the sake of their mutton, which is almost the only animal food freely consumed by the peasantry. Cattle-breeding, bee-keeping, and the cultivation of fruit and vegetables, especially potatoes and beetroot, are among the principal resources of the people, while wheat, rye, barley, oats, Indian corn, hemp and millet are also grown. Viticulture is carried on with great and increasing success (see Wine).

**Land-tenure.**—Individual proprietorship of the soil is rare, for, despite the decadence of the *sadruja* or household community, the tenure of land and the privilege of using the communal domain still appertain to the family as a whole. There are a few large estates, but most of the land is parcellled out in small holdings.

**Industries.**—Besides fishing, farming and such allied trades as ship-building, wine and oil pressing, and the distillation of spirits, notably *maraschino,* a few other industries are practised, such as tile-burning and the manufacture of soap; but these are of minor importance. Certain crafts are also carried on by the country-folk, in their own homes; thus the peasant is sometimes his own mason, carpenter, weaver and miller. Manufactured goods and foodstuffs are imported, in return for asphalt, lignite, bay salt, wine, spirits, oil, honey, wax and hides; and there is a lucrative transit trade with Bosnia and Herzegovina, Montenegro, Turkey and various Adriatic and Mediterranean ports.

**Communications.**—Communications are defective, some parts of the interior being only accessible by the roughest of mountain roads. The principal railway, in point of size, traverses the central districts, linking together Knin, Spalato, Sebenico and Sinj; but the southern lines, which unite Dalmatia with Herzegovina, terminate at Ragusa. Metković and Castelnuovo, on the Bocche di Cattaro, are almost of equal importance, Cattaro being one of the chief outlets for Montenegrin commerce, while the vessels which steam up the Narenta to Metković carry the bulk of the sea-borne trade of Herzegovina. In 1897 Dalmatia possessed 151 post and 98 telegraph offices.

**Chief Towns.**—The chief towns are Zara, the capital, with 32,506 inhabitants in 1900, Spalato (27,108), Sebenico (24,751), Traù (17,604), Ragusa (13,174), Makarsca (11,016), and Cattaro (5418). All these are described under separate headings.

**Population and National Characteristics.**—With a constant excess of male over female children, the population increased steadily from 1869 to 1900, when it reached 951,597. Of this total 1% are foreigners and about 3% Italians, whose numbers tend slowly to diminish. The Morlachs, who constitute the remaining 96% belong to the Serbo-Croatian branch of the Slavonic race, having absorbed the Latinized Illyrians, Albanians and other alien elements with which they have been associated. The name of Morlachs, Morlaks or Morlaki commonly bestowed by English writers on the Dalmatian Slavs, though sometimes restricted to the peasantry of the hills, is an abbreviated form of Mavrovlasti, meaning either "Black Vlachs," or, less probably, "Sea Vlachs." It was originally applied to the scattered remnants of the Latin or Latinized inhabitants of central Illyria, who were driven from their homes by the barbarian invaders during the 7th century, and took refuge among the mountains. Throughout the middle ages the Mavrovlasti were usually nomadic shepherds, cattle-drivers or muleteers. In the 14th century they emigrated from central Illyria into northern Dalmatia and maritime Croatia; and these regions were thenceforward known as Mavrovlaci, until the 18th century. Gradually, however, the Mavrovlasti became identified with the Slavs, whose language and manners they adopted, and to whom they gave their own name. In northern Dalmatia the Slavs of the interior are still called Morlacci; in the south they express contempt. Of the Vlachs, properly so called, very few are left in the country; although the name *Vlachs* (q.v.) is frequently used by the Slavs to designate the Italians and the town-dwellers generally. The literary languages of Dalmatia are Italian and Serbo-Croatian; the spoken language is, in each case, modified by the introduction of various dialect forms.

The Morlachs wear a picturesque and brightly-coloured costume, resembling that of the Serbs (see Servia). In appearance they are sometimes blond, with blue or grey eyes, like the Shumadian peasantry of Servia; more often, olive-skinned, with dark hair and eyes, like the Montenegrins, whom they rival in stature, strength and courage; while their conservative spirit, their devotion to national traditions, poetry and music, their pride, indulgence and superstition, are typically Servian. Dalmatian public life is deeply affected by the jealousies which subsist between the Slavs and the Italians, whose influence, even everywhere waning, remains predominant in some of the towns; and between Orthodox "Serbs," who use the Cyrillic alphabet, and Roman Catholic "Croats," who prefer the Latin.

**Government.**—Dalmatia occupies a somewhat anomalous position in the Austro-Hungarian state system. Itself a crownland of Austria, returning eleven members to the Austrian parliament, it is severed geographically from the other Austrian lands by the Hungarian kingdom of Croatia. Ethnologically it is one with Croatia, and it is included in the official title of the Croatian king, *i.e.* the emperor. The political system is based on a law of the 20th of February 1861. The provincial diet is composed of 43 members, comprising the Roman Catholic archbishop, the Orthodox bishop of Zara and representatives of the chief taxpayers, the towns and the communes. Benkovac, on the main road from Zara to Spalato, Cattaro, Curzola, Imotski, 21 m. N. by E. of Macarsca, Knin, Lesina, Macarsca, Ragusa, Sebenico, Sinj, Spalato and Zara, give names to the twelve administrative districts, of which they are the capitals.

**Defence.**—Conscription is in force, as elsewhere in Austria, and the Dalmatian coast furnishes the Austrian—as formerly the Venetian—navy with many of its best recruits.

**Religion.**—Roman Catholicism is the religion of more than 80% of the population, the remainder belonging chiefly to the Orthodox Church. The Roman Catholic archbishop has his seat in Zara, while Cattaro, Lesina, Ragusa, Sebenico and Spalato are bishoprics. At the head of the Orthodox community stands the bishop of Zara.

The use of Slavonic liturgies written in the Glagolitic alphabet, a very ancient privilege of the Roman Catholics in Dalmatia and Croatia, caused much controversy during the first years of the 20th century. There was considerable danger that the Latin liturgies would be altogether superseded by the Glagolitic, especially among the northern islands and in rural communes, where the Slavonic element is all-powerful. In 1904 the Vatican forbade the use of Glagolitic at the festival of SS. Cyril and
DALMATIA

Methodius, as likely to impair the unity of Catholicism. A few years previously the Slavonic archbishop Rajčević of Zara, in discussing the "Glagolitic controversy," had denounced the movement as "an innovation introduced by Panslavism to make it easy for the Catholic clergy, after any great revolution in the Balkan States, to break with Latin Rome." This view is shared by many, perhaps by the majority, of the Roman Catholics in Dalmatia.

Education.—Education progressed slowly between 1860 and 1900, attendance at school being often a hardship in the poor and widely scattered hamlets of the interior. In 1890 more than 80% of the population could neither read nor write, although schools are maintained by every commune. In 1893 the country possessed 5 intermediate and 337 elementary schools, 6 theological seminaries, 6 gymnasiums, and about 40 continuation and technical schools.

Antiquities.—To the foreign visitor Dalmatia is chiefly interesting as a treasury of art and antiquities. The grave-mounds of Curzola, Lesina and Sabioncello have yielded a few relics of prehistoric man, and the memory of the early Celtic conquerors of Dalmatia still lingers, in the place-names; but the mounds left by the Romans are numerous and precious. They are chiefly confined to the cities; the civilization of the country was always urban, just as its history is a record of isolated city-states rather than of a united nation. Beyond the walls of its larger towns, little was spared by the barbarian Goths, Avars and Slavs; and the banded fragments of Roman work which mark the sites of Salona, near Spalato, and of many other ancient cities, are of slight antiquarian interest and slighter artistic value. Among the monuments of the Roman period, by far the most noteworthy in Dalmatia, and, indeed, in the whole Balkan Peninsula, is the Palace of Diocletian at Spalato (q.v.). Dalmatian architecture was Byzantine in its general character from the 6th century until the close of the 10th. The oldest memorials of this period are the vestiges of three basilicas, excavated in Salona, and dating from the first half of the 7th century at latest. Byzantine art, in the latter half of this period and the two succeeding centuries, continued to flourish in those cities which, like Zara, gave their allegiance to Venice; just as, in the architecture of Traù and other cities dominated by Hungary, there are distinct traces of German influence. The belfry of S. Maria, at Zara, erected in 1105, is first in a long list of Romanesque buildings. At Arbe there is a beautiful Romanesque campanile which also belongs to the 11th century; but the finest example in this style is the cathedral of Traù. The 14th century Dominican and Franciscan convents in Ragusa are also noteworthy. Romanesque lingered on in Dalmatia until it was displaced by Venetian Gothic in the early years of the 15th century. The influence of Venice was then at its height. Even in the hostile republic of Ragusa the Romanesque of the custom-house and Rectors' palace is combined with Venetian Gothic, while the graceful balconies and ogee windows of the Prijepolj closely follow their Venetian models. Gothic, however, which had been adopted very late, was abandoned very early; for in 1441 Giorgi Orsini of Zara, summoned from Venice to design the cathedral of Sebenico, brought with him the influence of the Italian Renaissance. The new forms which he introduced were eagerly imitated and developed by other architects, until the period of decadence—which virtually concludes the history of Dalmatian art—set in during the latter half of the 17th century. Special mention must be made of the carved woodwork, embroideries and plate preserved in many churches. The silver statuette and the reliquary of St Biagio at Ragusa, and the silver ark of St Simeon at Zara, are fine specimens of Byzantine and Italian jewelers' work, ranging in date from the 11th or 12th to the 17th century.

History

Dalmatia under Roman Rule, A.D. 9–1102.—The history of Dalmatia may be said to begin with the year 180 B.C., when the tribe from which the country derives its name declared itself independent of Gentius, the Illyrian king, and established a republic. Its capital was Delminium; its territory stretched northwards from the Neretva to the Cetina, and later to the Kerka, where it met the confines of Liburnia. In 156 B.C. the Dalmatians were for the first time attacked by a Roman army and compelled to pay tribute; but only in the time of Augustus (31 B.C.–A.D. 14) was their land finally annexed, after the last of many formidable revolts had been crushed by Tiberius in A.D. 9. This event was followed by total submission and a ready acceptancy of the Latin civilization which overspread Illyria (q.v.). The downfall of the Western Empire left this region subject to Gothic rulers, Odoacer and Theodoric, from 476 to 535, when it was added by Justinian to the Eastern Empire. The great Slavonic migration into Illyria, which wrought a complete change in the fortunes of Dalmatia, took place in the first half of the 7th century. In other parts of the Balkan Peninsula these invaders—Serbs, Croats or Bulgars—found little difficulty in expelling or absorbing the native population. But here they were baffled when confronted by the powerful maritime city-states, highly civilized, and able to rely on the moral if not the material support of their kinsfolk in Italy. Consequently, the country was left intact by the Slavs, and many of the little Italian population flocked for safety to Ragusa, Zara and other large towns, and the whole country was thus divided between two frequently hostile communities. This opposition was intensified by the schism between Eastern and Western Christianity (1054), the Slavs as a rule preferring the Orthodox or sometimes the Bogomil creed, while the Italians were firmly attached to the Papacy. Not until the 15th century did the rival races contribute to a common civilization in the literature of Ragusa. To such a division of population may be attributed the two dominant characteristics of local history—the total absence of national as distinguished from civic life, and the remarkable development of art, science and literature. Bosnia, Servia and Bulgaria had each its period of national greatness, but remained intellectually backward; Dalmatia failed ever to attain political or racial unity, but the Dalmatian city-states, isolated and compelled to look to Italy for support, shared in the march of Italian civilization. Their geographical position suffices to explain the relatively small influence exercised by Byzantine culture throughout the six centuries (533–1102) during which Dalmatia was part of the Eastern empire. Towards the close of this period Byzantine rule tended more and more to become merely nominal. In 860 Dalmatia was added to the Holy Roman empire, but was soon restored; in 879 the coast was ravaged by Saracens. A strange republic of Servian pirates arose at the mouth of the Neretva. In the 10th century description of Dalmatia by Constantine Porphyrogenitus (De Administrando Imperio, 20–37), this region is called Pagonia, from the fact that its inhabitants had only accepted Christianity about 960, or 250 years later than the other Slavs. These Pagoni, or Arentani (Narentines), utterly defeated a Venetian fleet despatched against them in 887, and for more than a century exacted tribute from Venice itself. In 998 they were finally crushed by the doge Pietro Orseolo II., who assumed the title duke of Dalmatia, though without prejudice to Byzantine suzerainty. Meanwhile the Croatian kings had extended their rule over northern and eastern Dalmatia, exacting tribute from the Italian cities of Traù, Zara and others and consoling their German overlords in the purely Slavonic towns, such as Nona or Belgrad (Zaravecchia). The Church was involved in the general confusion; for the synod of Spalato, in 1059, had forbidden the use of any but Greek or Latin liturgies, and so had accentuated the differences between Latin and Slav. A raid of Norman corsairs in 1073 was hardly defeated with the help of a Venetian fleet.

1 Also written Delminium, Dominium, and Dalmi. Thomas of Spalato (c. 1200–1250) mentions that the site of Delminium had been forgotten in his time, although certain ancient walls among the mountains were believed to be its ruins. It has been variously identified, by modern archaeologists, with Almisa, on the coast, Dalen, in the Herzegovina, Dubno, near Sinj, and Gardun, in the same locality. It was evidently a stronghold of considerable size and importance, and Appian (De bellis Illyricis) alludes to its almost impenetrable fortifications.
Rivalry of Venice and Hungary in Dalmatia, 1102–1420.—Unable amid such dissensions to stand alone, unprotected by the Eastern empire and hindered by their internal dissensions from uniting in a defensive league, the city-states turned to Venice and Hungary for support. The Venetians, to whom they were already bound by race, language and culture, could afford to concede liberal terms because their own principal aims was not the territorial aggrandizement sought by Hungary, but only such a supremacy as might prevent the development of any dangerous political or commercial competitor on the eastern Adriatic. Hungary had also its partisans; for in the Dalmatian city-states, like those of Greece and Italy, there were almost invariably two jealous political factions, each ready to oppose any measure advocated by its antagonist. The origin of this division seems here to have been economic. The farmers and the merchants who traded in the interior naturally favoured Hungary, their most powerful neighbour on land; while the seafaring community looked to Venice as mistress of the Adriatic. In return for protection, the cities often furnished a contingent to the army or navy of their suzerain, and sometimes paid tribute either in money or in kind. Arbe, for example, annually paid ten pounds of silk or five pounds of gold to Venice. The citizens cited the Venetian privilege of quartering the Hungarian soldiers after the conquest of Dalmatia in 1102–1105 by Coloman of Hungary. Subject to the royal assent they might elect their own chief magistrate, bishop and judges. Their Roman law remained valid. They were even permitted to conclude separate alliances. No alien, not even a Hungarian, could reside in a city where he was unwelcome; and the man who disliked Hungarian dominion could emigrate with all his household and property. In lieu of tribute, the revenue from customs was in some cases shared equally by the king, chief magistrate, bishop and municipality. These rights and the analogous privileges granted by Venice were, however, too frequently infringed, Hungarian garrisons being quartered on unwilling towns, while Venice interfered with trade, with the appointment of bishops, or with the tenure of communal domains. Consequently the Dalmatians remained loyal only while it suited their interests, and insurrections frequently occurred. Even in Zara four outbreaks are recorded between 1180 and 1345, although Zara was treated with special consideration by its Venetian masters, who regarded its possession as essential to their maritime ascendancy. The doubtful allegiance of the Dalmatians, privatized after the fall of the empire, was further complicated by the struggle between Venice and Hungary, which was further complicated by internal discord due largely to the spread of the Bogomil heresy; and by many outside influences, such as the vague suzerainty still enjoyed by the Eastern emperors during the 12th century; the assistance rendered to Venice by the armies of the Fourth Crusade in 1202; and the Tartar invasion of Dalmatia forty years later (see Tràb). The Slavs were no longer regarded as a hostile race, but the power of certain Croatian magnates, notably the counts of Bribir, was from time to time supreme in the northern districts (see Croatia-Slavonia); and Stephen Tvrko, the founder of the Bosnian kingdom, was able in 1389 to annex the whole Adriatic littoral between Cattaro and Fiume, except Venetian Zara and his own independent ally, Ragusa (see Bosnia and Herzegovina). Finally, the rapid decline of Bosnia, and of Hungary itself when assailed by the Turks, rendered easy the success of Venice; and in 1420 the whole of Dalmatia, except Almissa, which yielded in 1444, and Ragusa, which preserved its freedom, either submitted or was conquered. Many cities welcomed the changes as the promise of tranquillity. An interval of peace ensued, but meanwhile the Turkish advance continued. Constantinople fell in 1453, Servia in 1459, Bosnia in 1463 and Herzegovina in 1483. Thus the Venetian and Ottoman frontiers met; border wars were incessant; Ragusa sought safety in friendship with the invaders. In 1508 the hostile league of Cambrai compelled Venice to withdraw its garrison for home service, and after the overthrow of Hungary at Mohacs in 1526 the Turks were able easily to conquer the greater part of Dalmatia. The peace of 1540 left only the maritime cities to

Venice, the interior forming a Turkish province, governed from the fortress of Cissa by a Sanjak bey, or administrator with military powers. Christian Slavs from the neighbouring lands now throned to the towns, outnumbering the Italian population and introducing their own language, but falling under the influence of the Roman Catholic Church. The pirate community of the Uskoks (q.v.) had originally been a band of these fugitives; its exploits contributed to a renewal of war between Venice and Turkey (1571–1573). An extremely curious picture of contemporary manners is presented by the Venetian agents, whose reports on this war resemble some knightly chronicle of the middle ages, full of single combats, tournaments and other chivalrous adventures. They also show clearly that the Dalmatian levies far surpassed the Italian mercenaries in skill and courage. Many of these troops served abroad; at Lepanto, for example, in 1571, a Dalmatian squadron assisted the allied fleets of Spain, Venice, Austria and the Papal States to crush the Turkish navy. A fresh war broke out in 1645, lasting interminably until 1669, when the peace of Carlowitz gave the whole of Dalmatia to Venice, including the coast of Herzegovina, but excluding the domains of Ragusa and the protecting band of Ottoman territory which surrounded them. After further fighting the Armistice was confirmed in 1718 by the treaty of Carlowitz and it remained valid, though modified by the destruction of Ragusan liberty and the substitution of Austrian Hungary for Venice and Turkey.

The intellectual life of Dalmatia during the 15th, 16th and 17th centuries reached a higher level than any attained by the purely Slavonic peoples of the Balkan Peninsula. Its chief monuments are described elsewhere,—the work of the Ragusan poets and historians as a part of Servian literature, the scientific achievements of R. G. Bosovich and Marcantonio de Dominis in separate biographies. Architecture and art generally have been discussed above. But this intellectual development was the work of a small and opulent minority in all the cities except Ragusa. Popular education was neglected; Zara had no printing-press until 1706; Venetian Dalmatia possessed only one public school, and that an ecclesiastical seminary; and even the sons of the rich, though free to visit the universities of Italy, France, Holland and England, ran the risk of exile or worse punishment if they brought home too liberal a culture. Poorer students learned what they could from the clergy, and the peasants were wholly illiterate. Although the secular power of the Church was strictly limited, the country was overthrown by ecclesiastics. When Fortis visited the island of Arbe in the 18th century, he found a population of 3000, mostly fishermen, contributing to the stipends of sixty priests. There were also three monasteries and three nunneries. Heavy taxes, the salt monopoly, reckless destruction of timber, and a deliberate attempt to ruin the oil and silk industries, were among the means by which Venice prevented competition with its own trade. Although justice was fairly well administered and some show of municipal autonomy conceded, the right of electing a chief magistrate had been withheld after 1420; and the Grand Council or Senate of each city, losing its original democratic character, had degenerated into a mere tool of the resident Venetian agents (provveditori), officials who held their post for thirty-two months and were subject to little effective control. Nevertheless, 150 years of war against the common Turkish enemy had drawn the Venetians and their subjects closely together, and the loyalty of the Dalmatian soldiers and sailors abroad, if not of their fellow-citizens at home, rests beyond doubt.

Dalmatia after 1718.—After the fall of the Venetian republic in 1797, by the treaty of Campo Formio, gave Dalmatia to Austria. The republics of Ragusa and Pogizella retained their independence, and Ragusa grew rich by its neutrality during the earlier Napoleonic wars. By the peace of Pressburg in 1805 the country was handed over to France, but its occupation was ineffectually contested by a Russian force which seized the Bocche di Cattaro and induced the Montenegrins to render aid. Pogizella was

1 Long extracts from these reports or diaries are published by Wilkinson, Dalmatia and Montenegro (London, 1840), ii. 297-350.
DALMATIC

The dalmatic, or tunica dalmatica, is a liturgical vestment of the Western Church, proper to deacons, as the tunic (tunica) is to subdeacons. Dalmatic and tunic are now, however, practically identical in shape and size; though, strictly, the latter should be somewhat smaller and without the sleeves.

In most countries, e.g. England, France, Spain, and Germany, dalmatic and tunic are now no longer tunics, but scapular-like cloaks, with an opening for the head to pass through and square lapels falling from the shoulder over the upper part of the arm; in Italy, on the other hand, though open up the side, they still have regular sleeves and are essentially tunics.

The most characteristic ornament of the dalmatic and tunic is the vertical stripes running from the shoulder to the lower hem, these being connected by a cross-band, the position of which differs in various countries (see figs. 3, 4). Less essential are the orphreys on the hem of the arms and the fringes along the slits at the sides and the lower hem. The tassels hanging from either shoulder at the back (see fig. 6), formerly very much favoured, have now largely gone out of use.

The dalmatica, which originated—as its name implies—in Dalmatia, came into fashion in the Roman world in the 2nd century A.D. It was a loose tunic with very wide sleeves, and was worn over the tunica alba by the better class of citizens (see fig. 2). According to the Liber pontificum (ed. Duchesne, l. 171) the dalmatic was first introduced as a vestment in public worship by Pope Silvester I. (314-335), who ordered it to be worn by the deacons; but Braun (Litur. Gewandung, p. 259) thinks that it was probably in use by the popes themselves so early as the 3rd century, since St Cyprian (d. 258) is mentioned as wearing it when he went to his death. If this be so, it was probably given to the Roman deacons to distinguish them from the other clergy and to mark their special relations to the pope. However this may be, the dalmatic remained for centuries the vestment distinctive of the pope and his deacons, and—according to at least the view held at Rome—could be worn by other clergy only by special concession of the pope. Thus Pope Symmachus (498-514) granted the right to wear it to the deacons of Bishop Caesarius of Arles; and so late as 757 Pope Stephen II. gave permission to Fulrad, abbot of St Denis, to be assisted by six deacons at mass, and these are empowered to wear "the robe of honour of the dalmatic." How far, however, this rule was strictly observed, and what was the relation of the Roman dalmatic to the diaconal alba and subdiaconal tunica, which were in liturgical use in Gaul and Spain so early as the 6th century, are moot points (see Braun, p. 252). The dalmatic was in general use at the beginning of the 9th century, partly as a result of the Carolingian reforms, which established the Roman model in Western Europe; but it continued to be granted by the popes to distinguished ecclesiastics not otherwise entitled to wear it, e.g. to abbots or to the cardinal priests of important cathedrals. So far as the records show, Pope John XIII. (955-972) was the first to bestow the right to wear the dalmatic on an abbot, and Pope Benedict VII. the first to grant it to a cardinal priest of a foreign cathedral (972). The present rule was firmly established in the 11th century. According to the actual use of the Roman Catholic Church dalmatic and tunic are worn by deacon and subdeacon when assisting at High Mass, and at solemn processions and benedictions. They are, however, traditionally vested symbolically of joy (the bishop in placing the dalmatic on the newly ordained deacon says:—"May the Lord clothe thee in the tunic of joy and the garment of rejoicing"), and they are therefore not worn during seasons of fasting and penitence or functions connected with these, the folded chasuble (paena pliaca) being substituted (see CHASUBLE). Dalmatic and tunic are never worn by priests, as priests, but both are worn by bishops under the chasuble (never under the cope) and also by these prelates, not being bishops, to whom the pope has conceded the right to wear this episcopal vestment.

In England at the Reformation the dalmatic ultimately shared the fate of the chasuble and other mass vestments. It was, however, certainly one of the "ornaments of the minister" in the second year of Edward VI., the rubric in the office for Holy Communion directing the priest's "helpers" to wear "albes with tunacles." In many Anglican churches it has therefore been restored, as a result of the ritual revival of the 19th century, it being claimed that its use is obligatory under the "ornaments rubric" of the Book of Common Prayer (see VESTMENTS).

In the Eastern churches the only vestment that has any true analogy with the dalmatic or liturgical upper tunic is the sakkos, the tunic worn by deacons and subdeacons over their everyday clothes being the equivalent of the Western alb (q.v.). The sakkos, which, as a liturgical vestment, first appears in the 12th century as peculiar to patriarchs, is now a scapular-like robe very similar to the modern dalmatic (see fig. 5). Its origin is almost certainly the richly embroidered dalmatic that formed part of the consular insignia, which under the name of sakkos became a robe of state special to the emperors. It is clear, then, that this vestment could only have been assumed with the emperor's permission; and Braun suggests (p. 305) that its use was granted to the patriarchs, after the completion of the schism of East and West, in order "in some sort to give them the character, in outward appearance as well, of popes of the East." Its use is confined to the Greek rite. In the Greek and Greek-Melchite

FIG. 1.—Deacon in dalmatic, appareled amice and alb.
**Fig. 2.** Tunic of linen, woven with bands of purple wool embroidered with white flax. From the tombs at Akhmim. Egypto-Roman; 1st to 4th century. (In the Victoria and Albert Museum.)

**Fig. 3.** Back of a dalmatic of stamped green woollen velvet; the orphreys and apparels are of embroidered silk velvet. The two figures on the cross-band or apparel represent St. Gregory the Great and St. Augustine. The shields of arms are for the dukes of Jülich and Berg, counts of Ravensberg, and for the electors of Bavaria. Said to have come from the church of St. Severin, Cologne. German (Cologne); second half of 15th century. (In the Victoria and Albert Museum.)
Fig. 4.—Dalmatic of white satin embroidered with coloured silks and silver-gilt and silver thread. Spanish; early 17th century. (In the Victoria and Albert Museum.)

Fig. 5.—Greek sakkos, of red satin embroidered with silver-gilt and silver thread with silk. It has the names and arms of two archbishops. 18th century. (In the Victoria and Albert Museum.)

Fig. 6.—Dalmatic of Pope Pius V. An early example of the modern Roman type. Roman; 16th century. Preserved at Santa Maria Maggiore, Rome. From a photograph taken by Father J. Braun (in Die liturgische Gewandung), by permission of B. Herder.
churches it is confined to the patriarchs and metropolitans; in the Russian, Ruthenian and Bulgarian churches it is worn by all bishops. Unlike the practice of the Latin church, it is not worn under, but has replaced the phonelion (chasuble).

A silk dalmatic forms one (the undermost) of the English coronation robes. Its use would seem to have been borrowed, not from the robes of the Eastern emperors, but from the church, and to symbolize with the other robes the quasi-sacerdotal character of the kingship (see Coronation). The magnificent so-called dalmatic of Charlemagne, preserved at Rome (see Embroidery), is really a Greek sakkos.

See Joseph Braun, S.J., *Die liturgische Genaundung* (Freiburg im Breisgau, 1907), pp. 247-305. For further references and illustrations see the article Vestments.

W. A. P.

Dalmatonia, a village of Ayrshire, Scotland, 13 m. S.E. of Ayr by a branch line, of which it is a terminus of the Glasgow & South-Western railway. Pop. (1891) 1448. The district is rich in the coal, ironstone, sandstone and limestone. Though the place is of great antiquity, the Roman road running near it, few remains of any interest exist. It was, however, a centre of activity in the Covenanting times.

Dalous, Jules (1838-1902), French sculptor, was the pupil of Carpeaux and Duret, and combined the vivacity and richness of the one with the academic purity and scholarship of the other. He is one of the most brilliant virtuosos of the French school, admirable alike in taste, execution and arrangement. He first exhibited at the Salon in 1857, but when in 1871 the troubles of the Commune broke out in Paris, he took refuge in England, where he rapidly made a name through his appointment at South Kensington. Here he laid the foundation of that great improvement which resulted in the development of the modern British school of sculpture, and at the same time executed a remarkable series of terra-cotta statuettes and groups, such as "A Railway Accident" (of which a bronze version under the title of "Maturity" is enframed in the Institute of London and others), the group of two Boulogne women called "The Reader" and "A Woman of Boulogne telling her Beads." He returned to France in 1879 and produced a number of masterpieces. His great relief of "Mirabeau replying to M. de Dreux-Brézé," exhibited in 1883 and now at the Palais Bourbon, and the highly decorative panel, "Triumph of the Republic," were followed in 1883 by "The Procession of Silenus." For the city of Paris he executed his most elaborate and splendid achievement, the vast monument, "The Triumph of the Republic," erected, after twenty years' work, in the Place de la Nation, showing a symbolic figure of the Republic, aloft on her car, drawn by lions led by Liberty, attended by Labour and Justice, and followed by Peace. It is somewhat in the taste of the Louis XIV. period, ornate, but exquisite in every detail. Within a few days there was also inaugurated his great "Monument to Alphonse" (1890), which almost at success achieved an monument to Delacroix in the Luxembourg Gardens. Dalous, who gained the Grand Prix of the International exhibition of 1889, and was an officer of the Legion of Honour, was one of the founders of the New Salon (Société Nationale des Beaux-Arts), and was the first president of the sculpture section. In portraiture, whether statues or busts, his work is not less remarkable.

Dalarad, in geology, a series of metamorphic rocks, typically developed in the high ground which lies E. and S. of the Great Glen of Scotland. This was the old Celtic region of Dalriad, and in 1891 Sir A. Geikie proposed the name Dalradian as a convenient provisional designation for the complicated set of rocks to which it is difficult to assign a definite position in the stratigraphical sequence (Q.J.G.S. 47, p. 75). In Sir A. Geikie's words, "they consist in large proportion of altered sedimentary strata, now found in the form of mica-schist, graphitic-schist and hornblende-schist, phyllite, schistose girt, greywacke and conglomerate."

One of them, the Younger Dalriad, is situated near the head of Loch Linnhe, and is well described by M. J. Balfour. The eastern Dalradian of Scotland, the Schistes-Comblainiens, and the Dalriad of Ireland, are essentially the same. The Dalradian of the north-western counties of Ireland has been described by the north-western counties of Ireland. The whole of the Dalradian complex has suffered intense crushing and thrusting.

Dalriad, the name of two ancient Gaelic kingdoms, one in Ireland and the other in Scotland. The name means the home of the descendants of Riada. Irish Dalriada was the district which now forms the northern part of county Antrim, and from which about 700 some emigrants crossed over to Scotland, and founded in Argyllshire the Scottish kingdom of Dalriada. For a time Scottish Dalriada appears to have been dependent upon Irish Dalriada, but about 757 King Ailán secured its independence. One of Ailán's successors, Kenneth, became king of the Picts about 843, and the name Dalriada both in Ireland and Scotland fell into disuse.

See W. F. Skene, *Celtic Scotland* (Edinburgh, 1876-1880).

Dalry (Gaelic, "the field of the king"), a mining and manufacturing town of Ayrshire, Scotland, on the Garnock, 23\ 3 m. S.W. of Glasgow, by the Glasgow & South-Western railway. Pop. (1901) 5316. The public buildings include the library and reading-room, the assembly rooms, Davidshill hospital, Temperance hall and night asylum. There is a public park. The industries consist of woollen factories, worsted spinning, box-, cabinet-, coke- and brick-making, machine-knitting, currying and the manufacture of aerated waters. Coal and iron are found, but mining is not extensively pursued. In the vicinity are the iron works of Blair and Glangarnock, the Garnock box-, and the Royal Lune, known as Elie House, 30 ft. high and about 200 ft. long, offering some resemblance to a pointed aisle. Rye Water flows into the Garnock close to the town. Captains Thomas Crawford of Jordanhill (1530-1603), the caper of Dumbarton Castle, spent the closing years of his life at Dalry, where a considerable estate had been granted to him.

Dalton, John (1766-1844), English chemist and physicist, was born about the 6th of September 1766 at Eaglesfield, near Cockermouth in Cumberland. His father, Joseph Dalton, was a weaver in poor circumstances, who, with his wife (Deborah Greenup), belonged to the Society of Friends; they had three children—Jonathan, John and Mary. John received his early education from his father and from John Fletcher, teacher of the Quakers' school at Eaglesfield, on whose retirement in 1778 he himself started teaching. This youthful venture was not successful, the amount he received in fees being only about five shillings a week, and after two years he took to farm work. But he had received some instruction in mathematics from a distant relative, Elisha Robinson, and in 1781 he left his native village to become assistant to his cousin George Bely who kept a school at Kendal. There he passed the next twelve years, becoming in 1785, through the retirement of his cousin, joint manager of the school with his elder brother Jonathan. About 1790 he seems to have had thought of taking up law or medicine, but his projects met with no encouragement from his relatives and he remained at Kendal till, in the spring of 1793, he moved to Manchester, where he spent the rest of his life. Mainly through John Gough (1757-1825), a blind philosopher to whose aid he owed much of his scientific knowledge, he was appointed teacher of mathematics and natural philosophy at the New College in Moseley Street (in 1859 transferred to Manchester College, Oxford), and that position he retained until the removal of the college to York in 1799, where he became a "public and private teacher of mathematics and chemistry."

During his residence in Kendal, Dalton had contributed solutions of problems and questions on various subjects to the Gentleman's and Ladies' Diaries, and in 1787 he began to keep a meteorological diary in which during the succeeding fifty-seven
years he entered more than 200,000 observations. His first separate publication was *Meteorological Observations and Essays* (1793), which contained the germs of several of his later discoveries; but in spite of the originality of its matter, the book met with only a limited sale. Another work by him, *Elements of English Grammar*, was published in 1801. In 1794 he was elected a member of the Manchester Literary and Philosophical Society, and a few weeks after election he communicated his first paper on "Extraordinary facts relating to the vision of colours," in which he gave the earliest account of the optical peculiarity known as Daltonism or colour-blindness, and summed up its characteristics as observed in himself and others. Besides the blue and purple of the spectrum he was able to recognize only one colour, yellow, or, as he says in his paper, "that part of the image which others call red appears to me little more than a shade or defect of light; after that the orange, yellow and green seem one colour which descends pretty uniformly from an intense to a rare yellow, making what I should call different shades of yellow." This paper was followed by many others on diverse topics—on rain and dew and the origin of springs, on heat, the colour of the sky, steam, the auxiliary verbs and participles of the English language and the reflection and refraction of light. In 1800 he became a secretary of the society, and in the following year he presented the important paper or series of papers, entitled "Experimental investigation of mixed gases; on the state of steam or vapour of water and other liquids in different temperatures, both in Torricellian vacuum and in air; on evaporation; and on the expansion of gases by heat." The second of these essays opens with the striking remark, "There can scarcely be a doubt entertained respecting the reducibility of all elastic fluids of whatever kind, into liquids; and we ought not to despair of effecting it in low temperatures and by strong pressures exerted upon the unmixed gases"; further, after describing experiments to ascertain the tension of aqueous vapour at different points between 32° and 212° F., he concludes, from observations on the vapour of six different liquids, "that the variation of the force of vapour from all liquids is the same for the same variation of temperature, reckoning from vapour of any given force."

In the fourth essay he remarks, "I see no sufficient reason why we may not conclude that all elastic fluids under the same pressure expand equally by heat and that for any given expansion of mercury, the corresponding expansion of air is proportionally something less, the higher the temperature. ... It seems, therefore, that general laws respecting the absolute quantity and the nature of heat are more likely to be found from elastic fluids than from others. He thus enunciated the law of the expansion of gases, stated some months later by Gay-Lussac. In the two or three years following the reading of these essays, he published several papers on similar topics, that on the "Absorption of gases by water and other liquids" (1803), containing his "Law of partial pressures."

But the most important of all Dalton's investigations are those concerned with the Atomic Theory in chemistry, with which his name is inseparably associated. It has been supposed that this theory was suggested to him either by researches on oleifant gas and carburetted hydrogen or by analysis of "protoxide and deutoxide of azote," both views resting on the authority of Dr Thomas Thomson (1773-1852), professor of chemistry in Glasgow university. But from a study of Dalton's own MS. laboratory notebooks, discovered in the rooms of the Manchester society, Roscoe and Harden (A New View of the Origin of Dalton's Atomic Theory, 1896) conclude that so far from Dalton being led to the idea that chemical combination consists in the approximation of atoms of definite and characteristic weight by his search for an explanation of the law of combination in multiple proportions, the idea of atomic structure arose in his mind as a purely physical conception, forced upon him by study of the physical properties of the atmosphere and other gases. The first published indications of this idea are to be found at the end of his paper on the "Absorption of gases" already mentioned, which was read on the 21st of October 1803 though not published till 1805. Here he says: "Why does not water admit its bulk of every kind of gas alike? This question I have duly considered, and though I am not able to satisfy myself completely I am nearly persuaded that the circumstance depends on the weight and number of the ultimate particles of the several gases." He proceeds to give what has been quoted as his first table of atomic weights, but on p. 248 of his laboratory notebooks for 1802-1804, under the date 6th of September 1803, there is an earlier one in which he sets forth the relative weights of the ultimate atoms of a number of substances, derived from analysis of water, ammonia, carbon-dioxide, &c. by chemists of the time. It appears, then, that, confronted with the "problem of ascertaining the relative diameter of the particles of which, he was convinced, all gases were made up, he had recourse to the results of chemical analysis. Assisted by the assumption that combination always takes place in the simplest possible way, he thus arrived at the idea that chemical combination takes place between particles of different weights, and this it was which differentiated his theory from the historic speculations of the Greeks. The extension of this idea to substances in general necessarily led him to the law of combination in multiple proportions, and the comparison with experiment brilliantly confirmed the truth of his deduction (A New View, &c., pp. 50, 51). It may be noted that in a paper on the "Proportion of gases or elastic fluids constituting the atmosphere," read by him in November 1802, the law of multiple proportions appears to be anticipated in the words—"The elements of oxygen may combine with a certain portion of nitrous gas or with twice that portion, but with no intermediate quantity," but there is reason to suspect that this sentence was added some time after the reading of the paper, which was not published till 1805.

Dalton communicated his atomic theory to Dr Thomson, who by consent included an outline of it in the third edition of his *System of Chemistry* (1807), and Dalton gave a further account of it in the first part of the first volume of his *New System of Chemical Philosophy* (1808). The second part of this volume appeared in 1810, but the first part of the second volume was not issued till 1827, though the printing of it began in 1817. This delay is not explained by any excess of care in preparation, for much of the matter was out of date and the appendix giving the author's latest views is the only portion of special interest. The second part of vol. ii. never appeared.

Altogether Dalton contributed 116 memoirs to the Manchester Literary and Philosophical Society, of which from 1817 till his death were included in the *Proceedings* of the society, and the presidency of which he held after the resignation of his colleague. On the death of the latter, who had been the first secretary of the society, Dalton was elected president. Of these the earlier are the most important. In one of them, read in 1814, he explains the principles of volumetric analysis, in which he was one of the earliest workers. In 1840 a paper on the phosphates and arsenates, which was clearly unworthy of him, was refused by the Royal Society, and he was so incensed that he published it himself. He took the same course soon afterwards with four other papers, two of which—"On the quantity of acids, bases and salts in different varieties of salts" and "On a new and easy method of analysing sugar," contain his discovery, regarded by him as second in importance only to the atomic theory, that certain anhydrous salts when dissolved in water cause no increase in its volume, his inference being that the "salt enters into the pores of the water."

As an investigator, Dalton was content with rough and inaccurate instruments, though better ones were readily attainable. Sir Humphry Davy described him as a "very coarse experimenter," who "almost always found the results he required, trusting to his head rather than his hands." In the preface to the second part of vol. i. of his *New System* he says he had so often been misled by taking for granted the results of others that he "determined to write as little as possible but what I can attest by my own experience," but this independence he carried so far that it sometimes resembled lack of receptivity. Thus he distrusted, and probably never fully accepted, Gay-Lussac's conclusions as to the combining volumes of gases; he held peculiar and quite unfounded views about chlorine, even after
its elementary character had been settled by Davy; he persisted in using the atomic weights he himself had adopted, even when they had been superseded by the more accurate determinations of other chemists; and he always objected to the chemical notation devised by J. J. Berzelius, although by common consent it was much simpler and more convenient than his cumbersome system of circular symbols. His library, he was once heard to declare, he could carry on his back, yet he had not read half the books it contained.

Before he had propounded the atomic theory he had already attained a considerable scientific reputation. In 1804 he was chosen to give a course of lectures on natural philosophy at the Royal Institution in London, where he delivered another course in 1809–1810. But he was deficient, it would seem, in the qualities that make an attractive lecturer, being harsh and indistinct in voice, ineffective in the treatment of his subject, and "singularly wanting in the language and power of illustration." In 1810 he was asked by Davy to offer himself as a candidate for the fellowship of the Royal Society, but declined, possibly for pecuniary reasons; but in 1822 he was proposed without his knowledge, and on election paid the usual fee. Six years previously he had been made a corresponding member of the French Academy of Sciences, and in 1830 he was elected as one of its eight foreign associates in place of Davy. In 1833 Lord Grey's government conferred on him a pension of £150, raised in 1836 to £300. Never married, though there is evidence that he delighted in the society of women of education and refinement, he lived for more than a quarter of a century with his friend the Rev. W. Johns (1771–1845), in George Street, Manchester, where his daily round of laboratory work and tuition was broken only by annual excursions to the Lake district and occasional visits to London, "a surprising place and well worth one's while to see once, but the most disagreeable place on earth for one of a contemplative turn to reside in constandy." In 1822 he paid a short visit to Paris, where he met many of the distinguished men of science then living in the French capital, and he attended several of the earlier meetings of the British Association at York, Oxford, Dublin and Bristol. Into society he rarely went, and his only amusements was a game of bowls on Thursday afternoons. He died in Manchester in 1844 of paralysis. The first attack he suffered in 1837, and a second in 1838 left him much enfeebled, both physically and mentally, though he remained able to make experiments. In May 1844 he had another stroke; on the 26th of July he recorded with trembling hand his last meteorological observation, and on the 27th he fell from his bed and was found lifeless by his attendant. A bust of him, by Chantrey, was publicly subscribed for in 1833 and placed in the entrance hall of the Manchester Royal Institution.

See Henry, Life of Dalton, Cavendish Society (1854); Angus Smith, Memoir of John Dalton and History of the Atomic Theory (1856), which on pp. 253-263 gives a list of Dalton's publications; and Roscoe and Harden, A New View of the Origin of Dalton's Atomic Theory (1896); also Atom.

DALTON, a city and the county-seat of Whitley county, Georgia, U.S.A., in the N.W. part of the state, 100 m. N.N.W. of Atlanta. Pop. 1840: (1800) 4,135 (957 negroes); (1910) 5,274. Dalton is served by the Southern, the Nashville, Chattanooga & St Louis, and the Western & Atlanta (operated by the Nashville, Chattanooga & St Louis) railways. The city is in a rich agricultural region; ships cotton, grain, fruit and ore; and has various manufactures, including canned fruit and vegetables, flour and foundry and machine shop products. It is the seat of Dalton Female College. Dalton was founded by Duff Green and others in 1848, and was incorporated in 1874. Hither General Braxton Bragg retreated after his defeat at Chattanooga in the last week of November 1863. Three weeks afterwards Bragg, in command of the army in northern Georgia in winter quarters here, was replaced by General Joseph E. Johnston, who, with his force of 54,400, adopted defensive tactics to meet Sherman's invasion of Georgia, with his 99,000 or 100,000 men in the Army of the Cumberland (60,000) under General G. H. Thomas, the Army of the Tenness (25,000) under General J. B. M'Pherson, and the Army of the Ohio (14,000) under General J. M. Schofield. The Federal forces stretched for 20 m. in a position south of Ringgold and between Dalton and Ringgold and Dalton. Johnston's line of defences included Rocky Face Ridge, a wall of rock through which the railway passes 5 m. north-west of the city, Mill Creek (1 m. north-north-west of Dalton), which he damned so that it could not be forded, and earthworks north and east of the city. On the 7th of May General M'Pherson started for Resaca, 18 m. south of Dalton, to occupy the railway there in Johnston's rear, but he did not attack Resaca, thinking it too strongly protected; Thomas, with Schofield on his left, on the 7th forced the Confederates through Buzzard's Roost Gap (the pass at Mill Creek) north-west of Dalton; at Dug Gap, 4 m. south-west of Dalton, on the 8th a fierce Federal assault under Brigadier-General John W. Geary failed to dislodge the Confederates from a quite impregnable position. On the 11th the main body of Sherman's army followed M'Pherson toward Resaca, and Johnston, having evacuated Dalton on the night of the 12th, was thus forced, after five days' manoeuvring and skirmishing, to march to Resaca and to meet Sherman there. See J. D. Cox, The Atlanta Campaign (New York, 1882); Johnson and Buel, Battles and Leaders of the Civil War (4 vols., New York, 1887); and Official Records of the War of the Rebellion, series 1, vols. 34, 45, 49; series 2, vols. 4, 5, 6.

DALTON-IN-FURNESS, a market town in the North Lonsdale parliamentary division of Lancashire, England, 4 m. N.E. by N. of Barrow-in-Furness by the Furness railway. Pop. of urban district (1901) 13,020. The church of St Mary is in the main a modern reconstruction, but retains ancient fragments and a font believed to have belonged to Furness Abbey. This fine ruin lies 3 m. south of Dalton (see FURNES). St Mary's churchyard contains the tomb of the painter George Romney, a native of the town. Of Dalton Castle there remains a square tower, showing decorated windows. Here was held the manorial court of Furness Abbey. There are numerous iron-ore mines in the parish, and ironworks at Askam-in-Furness, in the northern part of the district.

DALY, AUGUSTIN (1838–1890), American theatrical manager and playwright, was born in Plymouth, North Carolina, on the 27th of April 1838. He first gained a career for himself in the New York papers from 1859, and he adapted or wrote a number of plays, Under the Gaslight (1867) being his first success. In 1860 he was the manager of the Fifth Avenue theatre, and in 1879 he built and opened Daly's theatre in New York, and, in 1883, Daly's theatre in London. At the former he gathered a company of players, headed by Miss Ada Rehan, which made for it a high reputation, and for them he adapted plays from foreign sources, and revived Shakespearean comedies in a manner before unknown in America. He took his entire company on tour, visiting England, Germany and France, and some of the best actors on the American stage have owed their training and first successes to him. Among these were Clara Morris, Sara Jewett, John Drew, Fanny Davenport, Maude Adams, Mrs Gilbert and many others. Daly was a great book-lover, and his valuable library was dispersed by auction after his death, which occurred in Paris on the 7th of June 1899. Besides plays, original and adapted, he wrote Washington: a Tribute to the Actress and the Woman (1888).

DALYELL (or D'ALZIELL or D'ALZELL), THOMAS (d. 1685), British soldier, was the son of Thomas Dalyley of Bins, Linlithgowshire, a cadet of the family of the earls of Carnwath, and of Janet, daughter of the 1st Lord Bruce of Kinloss, master of the rolls in England. He appears to have accompanied the Rochelle expedition in 1628, and afterwards, becoming colonel, served under Robert Munro, the general in Ireland. He was taken prisoner at the capitulation of Carrickfergus in August 1630, but was given a free pass, and having been banished from Scotland remained in Ireland. He was present at the battle of Worcester (3rd of September 1651), where his men surrendered, and he himself was captured and imprisoned in the Tower. In May he escaped abroad, and in 1654 took part in the Highland rebellion and was excepted from Cromwell's act of grace, a reward of £200 being offered for his capture, dead or alive. The king's cause being now for the time hopeless, Dalyley entered the
service of the tsar of Russia, and distinguished himself as general in the wars against the Turks and Tatars. He returned to Charles in 1665, and on the 10th of July 1666 he was appointed commander-in-chief in Scotland to subdue the Covenanters. He defeated them at Rullion Green and exercised his powers with great cruelty, his name becoming a terror to the peasants. He obtained several of the forfeited estates. On the 3rd of January 1667 he was made a privy councillor, and from 1678 till his death represented Linlithgow in the Scottish parliament. He was incensed by the choice of the duke of Monmouth as commander-in-chief in June 1679, and was confirmed in his original appointment by Charles, but in consequence did not appear at Bothwell Bridge till after the close of the engagement. On the 25th of November 1681, a commission was issued authorizing him to enrol the regiment afterwards known as the Scots Greys. He was continued in his appointment by James II., but died soon after the latter’s accession in August 1685. He married Agnes, daughter of John Ker of Cavers, by whom he had a son, Thomas, created a baronet in 1685, whose only son and heir, Thomas, died unmarried. The baronetage apparently became extinct, but it was assumed about 1726 by James Menteith, a son of the sister of the last baronet, who took the name of Dalryl; his last male descendant, Sir Robert Dalryl, died unmarried in 1886.

DAM. (1) (A common Teutonic word, cf. Swed. and Ger. damm, and the Gothic verb faurdammian, to block up), a barrier of earth or masonry erected to restrain, divert or contain a body of water, particularly in order to form a reservoir. (2) (Fr. dame, dame; Lat. domina, feminine of dominus, lord, master), the mother of an animal, now chiefly used of the larger quadrupeds, and particularly of a mare, the mother of a foal.

DAMAGES (through O. Fr. dommage, mod. Fr. dommage, from Lat. damnum, loss), the compensation which a person who has suffered a legal wrong is by law entitled to receive from the person responsible for the wrong. Loss caused by an act which is not a legal wrong (damnum sine injuria) is not recoverable, e.g. where a father loses a young child by the negligence of a third party.

The principle of compensation in law makes its first appearance as a substitute for personal retaliation. In primitive law something of the nature of the Anglo-Saxon weor-gild, or the word of the Iliad, appears to be universal. It marks out with great minuteness the measure of the compensation appropriate to each particular case of personal injury. And there is a resemblance between the legal compensation, as it may be called, and the satisfaction which an injured person, seeking his own remedy, would be likely to exact for himself. In such a system the two entirely different objects of personal satisfaction and criminal punishment are not clearly separated, and in fact, criminal and civil remedies were administered in the same proceeding.

Under modern systems of law, the object of legal compensation is to place the injured person as nearly as possible in the situation in which he would have been but for the injury; and the controlling principle is that compensation should be determined so far as possible by the actual amount of the loss sustained. In England, civil proceedings for reparation and criminal proceedings for punishment are with few exceptions carefully kept separate. In Scotland, pursuit of the two kinds of remedies in the same proceeding is possible but very rare; but in France and other European states it is lawful and usual in the case of those delicts which are also punishable criminally.

In the law of England the two historical systems of common law and equity viewed compensation or reparation from two different points of view. The principle of the common law was that the amount of every injury might be estimated by pecuniary valuation. The idea was no doubt derived from the old tariff of were, bat and wise, in which the valuations were elaborate. Until 1588 (Cairns’ Acts) courts of equity had no direct jurisdiction to award damages, and their business was to place the injured party in the actual position to which he was entitled (restitutio ad integrum). This difference comes out most clearly in cases of breach of contract. The common law, with a few partial exceptions, could do no more than compel the defaulter to make good the loss of the other party, by paying him an ascertained sum of money as damages. Equity, recognizing the fact that complete satisfaction was not in all cases to be obtained by mere money payment, compelled those who broke certain classes of contracts specifically to perform them, and in the case of acts or defaults not amounting to breach of contract, on satisfactory proof that a wrong was contemplated, would interfere to prevent it by injunction; while at common law no action could be brought until the injury was accomplished, and then only pecuniary damages could be obtained. Since the Judicature Acts this distinction has ceased and the appropriate remedy may be awarded in any division of the High Court of Justice.

Under the common law damages were always assessed by a jury. Under the existing procedure in England they may be assessed (1) by a jury under the directions of a judge; (2) by a judge alone or sitting with assessors; (3) by a referee, official or special, or officer of the courts with or without the assistance of mercantile or other assessors; (4) by a consensual tribunal such as an arbitrator or valuer selected by the parties. Whatever the mode of assessment, it is subject to review if the assessors have clearly mistaken the proper measure of damage.

In the case of assessment by a jury, the verdict may be set aside (i) if the damages are clearly excessive or perhaps insufficient, or arrived at by some irregular conduct, e.g. by setting down the sum which each jurymen would give and dividing the result by twelve. The appellate court, however, cannot, without the consent of the parties, itself fix the amount of damages in a case which has been submitted to a jury (Watt v. Watt, 1905, Appeal Cases 115).

The courts have gradually evolved certain rules or principles for the proper assessment of damages, although extreme difficulty is found in their application to concrete cases. A distinction is drawn between general and special damages. (1) General damage is that implied by law as necessarily flowing from the breach of right, and requiring no proof. (2) Special damage is that in fact caused by the wrong. Under existing practice this form of damage cannot be recovered unless it has been specifically claimed and proved, or unless the best available particulars or details have been before trial communicated to the party against whom it is claimed.

Contracts.—“The law imposes or implies a term that upon breach of contract damages must be paid.” The general tendency is that damages in cases of contract is (i) to make the amount of damages which may be awarded a matter of legal certainty, (ii) to leave to a jury or like tribunal little more to do than find the facts, (iii.) and to revise the assessment if it is clear that it has been made in disregard of the terms of the contract or of the natural and direct consequences of the breach. The measure of damage, general speaking, is the sum necessary to place the aggrieved party in the same position so far as money will do it as if the contract had been performed. If the breach is proved but the person complaining has suffered no real damage, he is entitled to have his legal right recognized by an award of what are called nominal damages, i.e. a sum just sufficient to carry a judgment in his favour on the infraction of his rights. Nominal damages, it will therefore be seen, are not the same as “small damages.” He is, however, also entitled to prove and recover the special or particular damage lawfully attributable to the breach. Where the contract is to pay a fixed sum of money or liquidated amount, the measure of damages for non-payment is the sum agreed to be paid and interest thereon at the rate stipulated in the contract or recognized by law.

The law is the same in Scotland and in France (Civil Code, art. 1153). In some contracts the parties themselves fix the sum to be paid as damages if the contract is not fulfilled. These damages are described as liquidated, in Scots law stipulated or estimated. It would be supposed that the sum thus fixed would be the proper damages to be awarded. And under the French
CIVIL CODE (arts. 1152, 1153, 1780) the stipulation of the parties as to the damages to be paid for breach of a stipulation other than for paying a sum of money is binding on the courts. But in England, Scotland and the United States, courts disregard the words used, and inquire into the real nature of the transaction in order to see whether the sum fixed is to be treated as ascertained damage or as a penalty to be held in terrem over the defaulter, and in the latter case, notwithstanding the stipulation, will require proof of the actual loss. In *Kemble v. Farren* (1829, 6 Bingham, 141), a contract between a manager and an actor provided that for a breach of any of the stipulations therein, the sum of £1,000 should be payable by the defaulter, not as a penalty, but as liquidated and ascertained damages. Yet, the court, observing that under the stipulations of the contract the sum of £1,000, if taken to be liquidated damages, might become payable for mere non-payment of a trifling sum, held that it was not fixed as damages, but as a penalty only. The case in which an agreed sum is most usually treated as a penalty is a bond to pay a fixed sum containing a condition that it shall be void if certain acts are done or a certain smaller sum paid. Another case is where a single lump sum is fixed as the liquidated amount of damage to be paid for doing or failing to do a number of different things of various degrees of importance (*Elphinstone v. Monkland Iron Co.*, 1887, 1 A.C. 333). But the courts have accepted as creating a contractual measure of damage a stipulation to finish sewerage works by a given day (*Law v. Redditch Local Board*, 1892, 1 Q.B. 127; or to complete torpedo boats within a limited time for a foreign government (*Clydebank Engineering Co. v. Yzaguirre*, 1905, A.C. 6). In this case the law lords indicated that the provision of an agreed sum was peculiarly appropriate in view of the difficulty of showing the exact damage which a state sustains by non-delivery of a warship. Where the damage is not liquidated or agreed as to, it is assessed to account evidence as to the actual loss naturally and directly flowing from the breach of contract.

In contracts for the sale of goods the measure of damages is fixed by statute. Where the buyer wrongfully refuses or neglects to accept and pay for, or the seller wrongfully neglects or refuses to deliver the goods, the measure is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer’s or seller’s breach of contract. Where there is an available market for the goods in question, the measure of damages is prima facie to be ascertained by the difference between the contract price and the market or current price at the time or times when the goods ought to have been accepted or delivered, or if no such time was fixed for acceptance or delivery, then at the time of refusal to accept or deliver (*Sale of Goods Act 1893, §§ 30, 57*).

Where there is no market, the value is fixed by the price of the nearest available substitute. Where the sufferer, at the request of the person in default, postpones purchase or sale, any increased loss thereby caused falls on the defaulter. If the buyer, before the time fixed for delivery, has resold the goods to a sub-vendor, he cannot claim against his own vendor any damages which the sub-vendor may recover against him for breach of contract, because he ought to have gone into the market and purchased other goods. But this is subject to modification in cases falling within the rule in *Hadley v. Baxendale* (1854, 9 Exchequer, 341). But trouble and expense incurred by the seller of finding a new purchaser or other goods may be taken account of in assessing the damages.

Where the goods delivered are not as contracted the buyer may as a rule sue the seller for a breach of warranty, or set it up as reduction of price. Where the warranty is of quality the loss is prima facie the difference between the value of the goods delivered when delivered and the value which they would have then had if they had answered to the warranty (*Sale of Goods Act 1893, § 53*). In an American case, where a person had agreed with a boarding-house keeper for a year, and quitted the house within the time, it was held that the measure of damages was not the price stipulated to be paid, but only the loss caused by the breach of contract. In contracts to marry, a special class of considerations is recognized, and the jury in assessing damages will take notice of the conduct of the parties. The social position and rank of the defendant may be given in evidence to show what the plaintiff has lost by the breach of contract.

On a breach of contract to replace stock the measure of damages is the price of the stock on the day, when it ought to have been delivered, or on the day of trial, at the plaintiff’s option. In contracts for the sale of reality, the measure of damage for breach by the vendor is the amount of any deposit paid by the would-be purchaser and of the expenses thrown away. But the purchaser may, in a proper case, obtain specific performance, and if he has been cheated may obtain damages in an action for deceit.

Breaches of trust are in a sense distinct from breaches of contract, as they fell under the jurisdiction of courts of equity and not of the common law courts. The rule applied was to require a defaulting trustee to make good to the beneficiaries any loss flowing from a breach of trust and not to allow him to set off against this liability any gain to the trust fund resulting from a different breach of trust or from good management (*Lewin on Trusts*, ed. 174, 145).

In estimating the proper amount to be assessed as damages for a breach of contract, it is not permissible to include every loss caused by the act or default upon which the claim for damages is based. The damage to be awarded must be that fairly and naturally arising from the breach under ordinary circumstances the special circumstances of the particular contract, or in other words, which may reasonably be supposed to have been in the contemplation of the parties at the time of making the contract. The chief authority for this rule is the case of *Hadley v. Baxendale* (1854, 9 Exch. 341), which has been accepted in Scotland and the United States and throughout the British empire, and often differs little, if at all, from the rule adopted in the French civil code (art. 1150). In that case damages were sought for the loss of profits caused by a steam mill being kept idle, on account of the delay of the defendants in serving a new shaft which they had contracted to make. The court held the damage to be too remote, and stated the proper rule as follows:

> Where two parties have made a contract which one of them has broken, the damages which the other party ought to receive in respect of such breach of contract should be such as may fairly and reasonably be considered either arising naturally, i.e., according to the usual course of things from such breach of contract itself, or such as may reasonably be supposed to have been in the contemplation of both parties at the time they made the contract as the probable result of the breach of it. Now if the special circumstances under which the contract was actually made were communicated by the plaintiffs to the defendants, and thus known to both parties, the damages resulting from such contract which they reasonably contemplated would be the amount of injury which would ordinarily flow from a breach of contract under these special circumstances so known and communicated. But on the other hand, if those special circumstances were wholly unknown to the party breaking the contract, he at the most could only be supposed to have had in his mind the amount of injury which would arise generally, and in the great multitude of cases not affected by any special circumstances, from such breach of contract.

The rule is, however, only a general guide, and does not obviate the necessity of inquiring in each case what are the natural or contemplated damages. In an action by the proprietor of a theatre, it was alleged that the defendant had written a libel on one of the plaintiff’s singers, whereby she was

1 In the Indian Contracts Code (Act xii. of 1872), the rule is thus summarized:

> “When a contract has been broken, the party who suffers by such breach is entitled to receive from the party who has broken the contract, compensation for any loss or damage caused to him thereby, which naturally arose in the usual course of things from such breach, or which the parties knew when they made the contract to be likely to result from the breach of it. Such compensation is not to be given for any remote or indirect loss or damage sustained by reason of the breach. . . . In estimating the loss or damage arising from a breach of contract, the means of remedying the inconvenience caused by the non-performance must be taken into account” (* § 73*).
DAMAGES

deterred from appearing on the stage, and the plaintiff lost his profits; such loss was held to be too remote to be the ground of an action for damages. In *Smeed v. Foord* (Ellis and Ellis, 620), the defendant contracted to deliver a threshing-machine to the plaintiff, a farmer, knowing that it was needed to thresh the wheat in the field. Damages were sought for injury done to the wheat by rain in consequence of the machine not having been delivered in time, and also for a fall in the market before the grain could be got ready. It was held that the first claim was good, as the injury might have been anticipated, but that the second was bad. When, through the negligence of a railway company in delivering bales of cotton, the plaintiffs, having no cotton to work with, were obliged to keep their workmen unemployed, it was held that the wages paid and the profits lost were too remote for damages. On the other hand, where the defendant failed to keep funds on hand to meet the drafts of the plaintiff, so that a draft was returned dishonoured, and his business in consequence was for a time suspended and injured, the plaintiff was held entitled to recover damage for such loss.

The rule that the contract furnishes the measure of the damages does not prevail in the case of unconscionable, *i.e.* unreasonable, absurd or impossible contracts. The old-school juggle in geometrical progressions has more than once been before the court, and the ground of action. Thus, when a man agreed for a horse a barley-corn per nail, doubling it every nail, and the amount calculated as 32 nails was 500 quarters of barley, the judge directed the jury to disregard the contract, and give as damages the value of the horse. And when a defendant had agreed for £5 to give the plaintiff two grains of rye on Monday, four on the next Monday, and so on doubling it every Monday, it was contended that the contract was impossible, as all the rye in the world would not suffice for it; but one of the judges said that, though foolish, it would hold in law, and the defendant ought to pay something for his folly. And when a man had promised £1000 to the plaintiff if he should find his owl, the jury were directed to mitigate the damages.

Interest is recoverable as damages at common law only upon mercantile securities, such as bills of exchange and promissory notes or where a promise to pay interest has been made in express terms or may be implied from the usage of trade or other circumstances [Mayne, *Damages* (7th ed.) 166]. Under the Civil Procedure Act 1833, the jury is allowed to give interest by way of damages on debts or sums payable at a certain time, or if not payable, from the date of demand in writing, and in actions on personal injuries, and in actions of tort arising out of conversion or seizure of goods.

In the United States, interest is in the discretion of the court, and is made to depend on the equity of the case. In both England and America compound interest, or interest on interest, appears to have been regarded with the horror that formerly attached to usury. Lord Eldon would not recognize as valid an agreement to pay compound interest. And Chancellor Kent held that compound interest could not be taken except upon a special agreement made after the simple interest became due.

In Scotland compound interest is not allowed by way of damages.

*Torts.*—In actions arising otherwise than from breach of contract (i.e. of tort, delict or quasi-delict), the principles applied to the assessment of damage in cases arising *ex contractu* are generally applicable (*The Notting Hill*, 1884, p. D. 105); but from the nature of the case less precision in assessment is attainable. The remoteness of the damage claimed is a ground for excluding it from the assessment. In some actions of tort the damages can be calculated with exactness just as in actions of contract, e.g. in most cases of interference with rights of property or injury to property. Thus, for wrongful dispossession from a plantation (in Samoa) it was held that the measure of damage was the annual value of the produce of the lands when wrongfully seized, less the cost of management, and that the wilful character of the seizure did not justify the infliction of a penalty over and above the loss to the plaintiff (*McArthur v. Cowan*, 1892, A.C. 73). Where minerals are wrongly severed and carried away, the damage is assessed by calculating the value of the mineral as a chattel and deducting the reasonable expense of getting it. But where the interference with property, whether real or personal, is attended by circumstances of aggravation such as crime or fraud or wanton insult, it is well established that additional damages may be awarded which in effect are penal or vindictive. In actions for injuries to the person or to reputation, it is difficult to make the damages a matter for exact calculation, and it has been found impossible or inexpedient by the courts to prevent juries from awarding amounts which operate as a punishment of the delinquent rather than as a true assessment of the reparation due to the sufferer. And while a bad motive (malice) is seldom enough to give a cause of action, proof of its existence is a potent inducement to a jury to swell the assessment of damages, as evidence of bad character may induce them to reduce the damages to a derisory amount. In the case of injuries to the person caused by negligence, the tribunal considers, as part of the general damage, the actual pain and suffering (including nervous shock but not wounded feelings) and the permanent or temporary character of the injury, and as special damage the loss of time and employment during recovery and the cost of cure. It is difficult by any arithmetical calculation to value pain and suffering; nor is it easy to value the effect of a permanent injury; and in the Workmen's Compensation Act and Employers' Liability Act, an attempt has been made in the case of workmen to assess by reference to the earnings of the injured person.

In the case of such wrongs as assault, arrest or prosecution, the motives of the defendant naturally affect the amount of general damage awarded, even when not essential elements in the case, and the damages are "at large." Any other rule would enable a man to distribute blows as he can utter curses at a statutory tariff of so much a curse, according to his rank. This position was strongly asserted in the cases arising out of the celebrated "General Warrants" (1763) in the time of Lord Camden, who is reported in one case to have said, "damages are designed not only as a satisfaction to the injured person, but as punishment to the guilty, and as a proof of the destitution in which the wrongful act is held by the jury." In another case he mentioned the importance of the question at issue, the attempt to exercise arbitrary power, as a reason why the jury might give exemplary damages. Another judge, in another case, said "I remember a case when the jury gave £500 damages for knocking a man's hat off; and the court refused a new trial." And he urged that exemplary damages for personal insult would tend to prevent the practice of dぬelling.

The right to give exemplary or punitive or (as they are sometimes called) vindictive damages is fully recognized both in England and in the United States, and especially in the following cases: (1) Against the co-respondent in a divorce suit. This right is the same as that recognized at common law in the abolished action of criminal conversation, but the damages awarded may by the court be applied for the maintenance and education of the children of the marriage or the maintenance of the offending wife. (2) In actions of trespass to land where the conduct of the defendant has been outrageous. (3) In actions of defamation spoken or written, attended by circumstances of aggravation, and the analogous action of malicious prosecution. (4) In the anomalous actions of seduction and breach of promise of marriage.

In actions for wrongs, as in those *ex contractu*, the damages may be general or special. In a few cases of tort, the action fails wholly if special damage is not proved, e.g. slander by imputing to a man vicious, unchaste or immoral conduct, slander of title to land or goods or nuisance.

In theory, English law does not recognize "moral or intellectual" damage, such as was claimed by the South African Republic after the Jameson Raid. The law of Scotland allows
a solutum for wounded feelings, as does French law under the name of dommage moral, épuvé par la partie lâche dans sa liberté, sa reclame, son hasardaire, par consideration, ses affections légitimes ou dans la jouissance de son patrimoine. Under this head compensation is awarded to widow, child or sister, for the loss of husband, parent or brother, in addition to the actual pecuniary loss (Dalloz, Nouveau Code civil, art. 1382). Claims of damage for negligence are defeated by proof of what is known as contributory negligence (faute commune). In other claims of tort, as already stated, the conduct of the claimant may materially reduce the amount of his damages.

In cases of damages to ships or cargo by collision at sea, the rule of the old court of admiralty (derived from the civil law and preserved by the Judicature Acts) is that when both or all vessels are to blame, the whole amount of the loss is divided between them. The rule appears not to apply to cases where death or personal injury results from the collision (“Vera Cruz,” 1884, 4 A.C. 39; “Bermina,” 1888, 13 A. C. 1).

Costs.—The costs of a legal proceeding are no longer treated as damages to be assessed by the jury, nor do they depend on any act of the jury. The right to recover them depends on the court, and they are taxed or assessed by its officers (see Costs). In a few cases where costs cannot be given, e.g., on compulsory acquisition of land in London, the assessing tribunal is invited to add to the compensation price the owner’s expense in the compensation proceedings.

Death.—In English law a right to recover damages for a tort as a general rule was lost on the death of the sufferer or of the delinquent. The cause of action was considered not to survive. This rule differs from that of Scots law (under which the claim for damages arises at the moment of injury and is not affected by the death of either party). The English rule has been criticized as barbarous, and has been considerably broken in upon by legislation, in cases of taking the goods of another (4 Edw. III., c. 7, 1330), and injuries to real or personal property (3 & 4 Will. IV., c. 42, 1832), but continues in force as to such matters as defamation, malicious prosecution and trespass to the person. By the Fatal Accidents Act 1846 (commonly called Lord Campbell’s Act), it is enacted that wherever a wrongful act would have entitled the injured person to recover damages (if death had not ensued), the person who in such case would have been liable shall be liable to an action for damages for the pecuniary loss which the death has caused to certain persons, and although the death shall have been caused under such circumstances as amount in law to felony.” The only persons by whom or for whose benefit such an action may be brought are the husband, wife, parent and child (including grandchild and stepchild, but not illegitimate child) of the deceased. The right of action and the measure of damages are statutory and distinct from the right which the deceased had till he died. It was held in Osborne v. Gillett, 1873, L.R. 8 Ex. 88, and has since been approved (Clark v. London General Omnibus Co., 1906, 2 K.B. 648), that no person can recover damages for the death of another wrongfully killed and to convict a third person, unless he claims through or represents the person killed, and unless that person in case of an injury short of death would have had a good claim to recover damages.

In Scotland the law of compensation for breach of contract is substantially the same as in England. In cases of delict or quasi-delict, the measure of reparation is a fair and reasonable compensation for the advantage which the sufferer would, but for the wrong, have enjoyed and has lost as a natural and proximate result of the wrong. The maxim actio personalis moritur cum persona also applies in Scots law; and even in cases of murder there has always been recognized a right to “assuagement.” See also Mayne on Damages, 7th ed.; Sedgwick on Damage; Bell, Principles of Law of Scotland.

DAMANHOUR—DAMASCUS

DAMANHOUR, a town of Lower Egypt, 38 m. E.S.E. of Alexandria by rail, capital of the richly-cultivated province of Behira. It is the ancient Timenhor, "town of Horus," which in Ptolemaic times was capital of a nome and lay on the Canopic branch of the Nile. Its name and other circumstances imply that Horus (= Apollo) was worshipped there in the same form as at Edfu (Brugsch, Dictionnaire geographique, p. 531), but its Greek name, Hermopolis Parva, should indicate Thoth as the local god. This apparent contradiction is perhaps due to some early misunderstanding that held its ground after the Greeks knew Egypt better. A much frequented fair is held at Damanhour three times a year, and there are several cotton manufactories. Population (1907) 38,752.

DAMARALAND, a region of south-western Africa, bounded W. by the Atlantic, E. by the Kalahari, N. by Ovampoland, and S. by Great Namaqualand. It forms the central portion of German South-West Africa. Damaraland is alternatively known as Hereroland, both names being derived from the tribes inhabiting the region. The so-called Damara consist of two probably distinct peoples. They are known respectively as "the Hill Damara" and "the Castle Damara," i.e., those who breed cattle in the plains. The Hill Damara are Negroes with much Hottentot blood, and have adopted the Hottentot tongue, while the Castle Damara are of distinct Bantu-Negro descent and speak a Bantu language. The term Damara ("Two Damara Women") is of Hottentot origin, and is not used by the people, who call themselves Ova-herero, "the Merry People" (see Hotentots and Herero).

DAMASCENING, or DAMASKETING, a term sometimes applied to the production of damask steel, but properly the art of incrusting wire of gold (and sometimes of silver or copper) on the surface of iron, steel or bronze. The surface upon which the pattern is to be traced is finely undercut with a sharp instrument, and the gold thread by hammering is forced into and securely held by the minute furrows of the cut surface. This system of ornamentation is peculiarly Oriental, having been much practised by the early goldsmiths of Damascus, and it is still eminently characteristic of Persian metal work.

DAMASCUS, the capital of Syria, (A.D. 480). In his early youth he went to Alexandria, where he spent twelve years partly as a pupil of Theon, a rhetorician, and partly as a professor of rhetoric. He then turned to philosophy and science, and studied under Hermeias and his sons, Ammonius and Heliodorus. Later on in life he migrated to Athens and continued his studies under Marinus, the mathematician, Zenodotus, and Isidore, the dialectician. He became a close friend of Isidore, succeeded him as head of the school in Athens, and wrote his biography, part of which is preserved in the Bibliotheca of Photius (see appendix to the Didot edition of Diogenes Laërtius). In 520 Justinian closed the school, and Damascus with six of his colleagues sought an asylum, probably in 532, at the court of Chosroes I., King of Persia. They found the conditions intolerable, and in 533, in a treaty between Justinian and Chosroes, it was provided that they should be allowed to return. It is believed that Damascus settled in Alexandria and there devoted himself to the writing of his works. The date of his death is not known.

His chief treatise is entitled Difficulties and Solutions of First Principles (Ἀναρία καὶ χίωνες περὶ τῶν πρώτων ὁρχῶν). It examines into the nature and attributes of God and the human soul. This examination is, in two respects, in striking contrast to that of certain other Neoplatonists writers. It is conspicuously free from that Oriental mysticism which stultifies so much of the later pagan philosophy of Europe. Secondly, it contains no polemic against Christianity, to the doctrines of which, in fact, there is no allusion. Hence the charge of impiety which Photius brings against him. His main result is that God is infinite, and as such, incomprehensible; that his attributes of goodness, knowledge and power are credited to him only by inference from their effects; that this inference is logically valid and sufficient for their human effect. He insists throughout on the unity and the indivisibility of God, whereas Plotinus and Porphyry had admitted only a Trinity, but even an Emnead (nine-fold personality).

Interesting as Damascus is himself, he is still more interesting...
as the last in the long succession of Greek philosophers. (See NEOPLATONISM.)

BIBLIOGRAPHY.—The *Arami* was partly edited by J. Kopp (1896), and in full by C. E. Ruelle (Paris, 1889). French trans. by Chaignet (1898). See T. Whittaker, The Neo-platonists (Cambridge, 1901); E. Zeller, History of Greek Philosophy; C. E. Ruelle, Le Philosophe Damascius (1861); Ch. Levêque, *Damasius* (Journal des savants, February 1891). See also works quoted under NEOPLATONISM and ALEXANDRIAN SCHOOL.

**DAMASCUS**, the chief town of Syria, and the capital of a government province of the same name, 57 m. from Beirut, situated in 33° 30' N., and 36° 18' E.

History.—The origin of the city is unknown, and the popular belief that it is the oldest city in the world still inhabited has much to recommend it. It has been suggested that the ideogram by which it is indicated in Babylonian monuments literally means "fortress of the Amorites"; could this be proved it would be valuable testimony to its antiquity if not its origin. The city is the capital of the governor's establishment is given in Genesis xv. 2, as Dammasek Eliezer, which is explained in the Aramaic and Syriac versions as "Eliezer of Damascus." This reading is adopted by the author of the Talmud, as well as the Hebrew text; it will not support it. There is probably here some textual corruption.

In the period of the Egyptian suzerainty over Palestine in the eighteenth dynasty Damascus (whose name frequently appears in the Tell el-Amarna tablets) was capital of the small province of Ubi. The name of the city in the Tell el-Amarna correspondence is Dimashka. Towards the end of that period the overrunning of Palestine and Syria by the Khabiri and Suti, the forerunners of the Aramaean immigration, changed the conditions, language and government of the country. One of the first indications of this change has been traced is the appearance of the Aramaean Darmese for Damascus in an inscription of Ramases III.

The growth of an independent kingdom with Damascus as centre must date from very early in the Aramaean occupation. It had reached such strength that though Tiglath-Pileser I. reduced the whole of northern Syria, and by the fame of his victories induced the king of Egypt to send him presents, yet he did not venture to attack Kadesh and Damascus, so that this kingdom acted as a "buffer" between the king of Assyria and the rising kingdom of Kadesh. However, after his accession made an expedition against Damascus as a reprisal for the assistance the city had given his enemy Hadadezer, king of Zobah. The expedition was successful; David smote of the Syrians 22,000 men, and took and garrisoned the city; “and the Syrians became servants to David, and brought gifts” (2 Sam. viii. 5, 6; 1 Chron. xviii. 5).

This statement, it should be noticed, has been questioned by some modern historical and textual critics, who believe that "Syria" (Hebrew *Aram*) is here a corruption for "Edom." There is no other evidence—save the corrupt passage, 2 Sam. xxiv. 6, where "Tahtîm-hodshi" is explained as meaning "the land of the Hittites to Kadesh"—that David's kingdom was so far extended northward. However this may be, it is evident that the Israelite possession of Syria did not last long. A subordinate of Hadadezer named Rezon (Raṣun) succeeded in establishing himself in Damascus and in founding there a royal dynasty. Throughout the reign of Solomon (1 Kings xi. 23, 24) this Rezon seems to have been a constant enemy to the kingdom of Israel. It is inferred from 1 Kings xv. 19 that Abijah, son of Reoboam, king of Judah, went with Tab-Rimmon of Damascus to assist him in his wars against Israel, and that afterwards Tab-Rimmon's son Ben-Hadad came to terms with the second successor of Jeroboam, Baasha. Asa, son of Abijah, followed his father's policy, and bought the aid of Syria, whereby he was enabled to destroy the border fort that Baasha had erected (1 Kings xv. 22).

Hostilities between Israel and Syria lasted to the days of Ahab. From Omri the king of Syria took cities and the right to establish a quarter for his merchants in Samaria (1 Kings xx. 34). His son Ben-Hadad made an unsuccessful attack on Israel at Aphek, and was allowed by Ahab to depart on a reversal of these terms (loc. cit.). This was the cause of a prophetic denunciation (1 Kings xx. 42).

According to the Assyrian records Ahab fought as Ben-Hadad's ally at the battle of Karkar against Shalmaneser in 854. This seems to indicate an intermediate defeat and vassalage of Ahab, of which no direct record remains; and it was probably in the attempt to throw off this vassalage in 853, the year after the battle of Karkar, that Ahab met his death in battle with the Syrians (1 Kings xxii. 34-40). In the reign of Jehoram, Naaman, the Syrian general, came and was cleansed by the prophet Elisha of leprosy (2 Kings v.).

In 843 Hazael assassinated Ben-Hadad and made himself king of Damascus. The states which Ben-Hadad had brought together into a coalition against the advancing power of Assyria all revolted; and Shalmaneser, king of Assyria, took advantage of this in 842 and attacked Syria. He wasted the country, but could not take the capital. Jehu, king of Israel, paid tribute to Assyria, for which Hazael afterwards revenged himself, during the time when Shalmaneser was distracted by his Armenian wars, by attacking the borders of Israel (2 Kings x. 23). In Christian IV. Suti (1889). See also BABYLONIA AND ASSYRIA, Chronology, § 5, and JEWS, §§ 10 sqq.)

Except for the abortive rising under Sargon in 720, we hear nothing more of Damascus for a long period. In 333 B.C., after the battle of Issus, it was delivered over by treachery to Parmenio, the general of Alexander the Great; the harem and treasures of Darius had here been lodged. It had a chequered history during the wars of the successors of Alexander, being occasionally in Egyptian hands. In 112 B.C. the empire of Syria was divided by Antiochus Grypus and Antiochus Cyzicus; the kingdom of Damascus was one of the six of the latter. Hyrcanus took advantage of the disputes among these rulers to independ his own kingdom. Demetrius Euceras, successor of Cyzicus, invaded Palestine in 88 B.C., and defeated Alexander Jannaeus at Shchem. On his dethronement and captivity by the Parthians, Antiochus Dionysus, his brother, succeeded him, but was slain in battle by Hāritha (Arethas) the Arab—the first instance of Arab interference with Damascus politics. Hāritha yielded to Tiganes, king of Armenia, who in his turn was driven out by Q. Caecilius Metellus (son of Scipio Nasica), the Roman general. In 63 Syria was made a Roman province.

In the New Testament Damascus appears only in connexion with the miraculous conversion of St Paul (Acts ix., xxii., xxvi.), his escape from Aretas the governor by being lowered in a basket over the wall (Acts ix. 25; 2 Cor. xi. 32, 33), and his return thither after his retirement in Arabia (Gal. i. 17).

In 150, under Trajan, Damascus became a Roman provincial city.

On the establishment of Christianity Damascus became the seat of a bishop who ranked next to the patriarch of Antioch. The great temple of Damascus was turned by Arcadius into an Omayyad church.

In 635 Damascus was captured for Islam by Khalid ibn Walid, the great general of the new religion, being the first city to yield after the battle of the Yarmuk (Hicromas). After the murder of Ali, the fourth caliph, his successor Moawiya transferred the seat of the Caliphate (q.v.) from Mecca to Damascus and thus commenced the great dynasty of the Omayyads, whose rule extended from the Atlantic to India. This dynasty lasted about ninety years; it was supplanted by that of the Abbasids, who removed the seat of empire to Mesopotamia; and Damascus
DAMASK

passed through a period of unrest in which it was captured and ravaged by Egyptians, Carmathians and Seljuks in turn. The crusaders attacked Damascus in 1126, but never succeeded in keeping a firm hold of it, even during their brief domination of the country. It was the headquarters of Saladin in the wars with the Franks. Of its later history we need only mention the Mongolian capture in 1260; its Egyptian recapture by the Mameluke Kotuz; the ferocious raid of Timur (Tamerlane) in 1399; and the conquest by the Turkish sultan Selim, whereby it became a city of the Ottoman empire (1516). In its more recent history the only incidents that need to be mentioned are its capture by Ibrahim Pasha, the Egyptian general, in 1832, when the city was first opened to the representatives of foreign powers; its revolt against Ibrahim's tyranny in 1834, which he crushed with the aid of the Druses; the return of the city to Turkish domination, when the Egyptians were driven out of Syria in 1840 by the allied powers; and the massacre of July 1860, when the Moslem population rose against the Christians, burnt their quarter, and slaughtered about 3000 adult males.

Modern City.—Damascus is a city with a population estimated at from 254,000 (35,000 Christians and Jews) to 225,000 (55,000 Christians and Jews), situated near the northern edge of a plain called the Ghoutah, at the foot of Anti-Lebanon, 2250 ft. above the sea. The river Barada (the Abunah of 2 Kings v. 12) rises in the Anti-Lebanon, runs for about 10 m. in a narrow channel, and then spreads itself fan-wise over the plain. About 18 m. east of the city it loses itself in the marshlands known as the Meadow Lakes. A second river, the Awaj (possibly the Pherpar of 2 Kings), pursues a similar course. The plain is thus exceptionally well irrigated, and its consequent fertility is proverbial over the East. Damascus is situated on both banks of the Barada, about 1 m. from the exit of the river from the gorge. On the right bank is all the older part of the city, and a long suburb called El-Meidân extending about a mile along the Hajj Road. On the left bank are the suburbs El 'Amâra and El-Salihia. The waters of the river are carried by channels and conduits to all the houses of the city. The orchards, gardens, vineyards and fields of Damascus are said to extend over a circuit of at least 60 m. In the surrounding plain are one hundred and forty villages, occupied in all by about 50,000 persons (1000 Christians, 2000 Druses).

The rough mud walls in the private houses give poor promise of splendour within. The entrance is usually by a low door, and through a narrow winding passage which leads to the outer court, where the master has his reception room. From this another winding passage leads to the harem, which is the principal part of the house. The plan of all is the same—an open court, with a tesselated pavement, and one or two marble fountains; orange and lemon trees, flowering shrubs, and climbing plants give freshness and fragrance. All the apartments open into the court; and on the south side is an open alcove, with a marble floor, and raised dais round three sides, covered with cushions; the dais is supported by an ornamented Saracenic arch. The decoration of some of the rooms is gorgeous, the walls being covered in part with mosaics and in part with carved wood, while the ceilings are rich in arabesque ornaments, elaborately gilt. A few of the modern Jewish houses have been embellished at an enormous cost, but they are wanting in taste.

Antiquities.—Considering the great age of Damascus, its comparative poverty in antiquities is remarkable. The walls of the city seem to be Seleucid in origin; some of the Roman gateways being still in good order. The Derb el-Mistakim, or "Straight Street," still runs through the city from the eastern to the western gate. At the north-west corner is a large castle built in A.D. 1219, by El-Malik el-Ashraf, on the site of an earlier palace. It is quadrangular, surrounded by a moat filled by the Barada. The outer walls are in good preservation, but the interior is ruined.

The church of St John the Baptist constructed by Arcadius on the site of the temple was turned by Caliph Walid I. (705-717) to a mosque which was the most important building of Damascus. It was a structure 431 ft. by 125 ft.; interior dimensions, extending along the south side of a quadrangle 163 yds by 108 yds. Except the famous inscription over the door—"Thy kingdom, O Christ, is an everlasting kingdom, and thy dominion endureth throughout all generations"—every trace of Christianity was effaced from the church at its conversion. It was destroyed by fire on the 14th of October 1893, and though it was subsequently rebuilt, much that was of archaeological and historical interest perished. It is estimated that there are over two hundred mosques in Damascus.

Products, Manufactures, &c.—Damascus occupies an important commercial position, being the market for the whole of the desert; it also is of great importance religiously, as being the starting-point for the Hajj pilgrimage from Syria to Mecca, which leaves on the 13th of the lunar month of Shawwal each year. This of course brings much trade to the city. Its chief manufactures are silk work, cloths and cloaks, gold and silver ornaments, &c., brass and copper work, furniture and ornamental woodwork. The barbers of Damascus are among the most famous of their craft. It is connected with Beirut and Mezerib by railway, and at the end of the past century the great undertaking of running a line to Mecca was commenced. In the surrounding gardens and fields walnuts, apricots, wheat, barley, maize, &c. are grown. Its commercial importance is referred to by Ezekiel (xxvii. 18), who mentions its trade in wines and wool. The climate is good; in winter there is often hard frost and much snow, and even in summer, with a day temperature of 100° F., the nights are always cool. Fever, dysentery and ophthalmia, chiefly due to exposure to heavy dews and cold nights, are prevalent. Though still the market of the nomads, the surer and cheaper sea route has almost destroyed the transit trade to which it once owed its wealth, and has even diminished the importance of the annual pilgrim caravan to Mecca. The Damascene, however, still retains his skill as a craftsman and tailor of the soil. The chief imports are cloths, prints, muslins, raw silk, sugar, rice, &c.

The value of exports and imports in certain specified years is shown in the following table:

Most of the Christians belong to the Orthodox and Roman Catholic (United) Greek Churches; and there are also communities of Melchites, Jacobites, Maronites, Nestorians, Armenians and Protestants. There are Protestant missions, founded 1843, and a British hospital.

DAMASK, the technical term applied to certain distinct types of fabric. The term owes its origin to the ornamental silk fabrics which were elaborately woven in colours, sometimes with the addition of gold and other metallic threads. At the present day it denotes a linen texture richly figured in the weaving with flowers, fruits, forms of animal life, and other types of ornament. "China, no doubt," says Dr. Rock (Catalogue of Textile Fabrics, Victoria and Albert Museum), "was the first country to ornament its silken webs with a pattern. India, Persia, and Syria, then Byzantine Greece followed, but at long intervals between, in China's footsteps. Stuffs so figured brought with them to the West the name 'diaprion' or diaper, bestowed upon them at Constantinople. But about the 12th century the city of Damascus, even then long celebrated for its looms, so far outstripped all other places for beauty of design, that her silken textiles were in demand everywhere; and thus, as often happens, traders fastened the name of damascen or damask upon every silken fabric richly wrought and curiously designed, no matter whether it came or not from Damascus." The term is perhaps now best known in reference to damask table-cloths,
species of figured cloth usually of flax or tow yarns, but sometimes made partly of cotton. The finer qualities are made of the best linen yarn, and, although the latter is of a brownish colour during the weaving processes, the ultimate fabric is pure white. The high lights in these cloths are obtained by long floats of warp and weft, and, as these are set at right angles, they reflect the light differently according to the angle of the rays of light; the effect changes also with the position of the observer. Subdive effects are produced by shorter floats of yarn, and sometimes by special weaves. Any subject, however intricate, can be copied by this method of weaving, provided that expense is no object. The finest results are obtained when the so-called double damask weaves are used. These weaves are shown under Die, and it will be seen that each weave gives a maximum float of seven threads. (In some special cases a weave is used which gives a float of nine.) The small figure here shown to illustrate a small section of a damask design is composed of the single damask Weaves; these give a maximum float of four threads or picks. No shading is shown in the design, and this for two reasons—(1) the single damask weaves do not permit of elaborate shading, although some very good effects are obtainable; (2) the available space is not sufficiently large to show the method to advantage. The different single damask weaves used in the shading of these cloths appear, however, at the bottom of the figure, while between these and the design proper there is an illustration of the thirty-first pick interweaving with all the forty-eight threads.

The principal British centres for fine damasks are Belfast and Dunfermline, where the medium qualities are made in several places in Ireland, in a few places in England, and in the counties of Fif, Forfar and Perth in Scotland. Cotton damasks, which are made in Paisley, Glasgow, and several places in Lancashire, are used for toilet covers, table cloths, and similar purposes. They are often ornamented with colours and sent to the Indian and West Indian markets. Silk damasks for curtains and upholstery decoration are made in the silk-weaving centres.

DAMASK STEEL, or DAMASCUS STEEL, a steel with a peculiar watered or streaked appearance, as seen in the blades of fine swords and other weapons of Oriental manufacture. One way of producing this appearance is to twist together strips of iron and steel of different quality and then weld them into a solid mass. A similar but inferior result may be obtained by etching with acid the surface of a metal; parts of which are protected by some greasy substance in such a way as to give the watered pattern desired. The art of producing damask steel has been generally practised in Oriental countries from a remote period, the most famous blades having come from Isfahan, Khorasan, and Shiraz in Persia.

DAMASUS I., the name of two popes.

Damasus I. was pope from 366 to 384. At the time of the banishment of Pope Liberius (355), the deacon Damasus, like all the Roman clergy, made energetic protest. When, however, the emperor Constantius sent to Rome an anti-pope in the person of Felix II., Damasus, with the other clergy, rallied to his cause. When Liberius returned from exile and Felix was expelled from Rome, Damasus again took his place among the adherents of Liberius. On the death of Liberius (366) a considerable party nominated Damasus successor; but the irreconcilables of the party of Liberius refused to pardon his trimming, and set up against him another deacon, Ursinus. A serious conflict ensued between the rival factions, which quickly led to rioting and hand-to-hand fighting. In one of these encounters the then new basilica, called the Liberian Basilica (S. Maria Maggiore), was partially destroyed, and 137 dead bodies were left in the building. On several occasions the secular arm had to intervene, although the government of the emperor Valentinian was averse from involving itself in ecclesiastical affairs. From the outset the prefect of Rome recognized the claims of Damasus, and exerted himself to support him. Ursinus and the leading men of his faction were expelled from Rome, and afterwards from central Italy, or even interned in Gaul. They, however, persisted obstinately in their opposition to Damasus, combating him at first by riots, and then by calumnious law-suits, such as that instituted by one Isaac, a converted and relapsed Jew.

To the official support, which never failed him, Damasus endeavoured to join the popular sympathy. From before his election he had been in high favour with the Roman aristocracy, and especially with the great ladies. At that period the urban masses, but recently converted to Christianity, sought in the worship of the martyrs a sort of substitute for polytheism. Damasus showed great zeal in discovering the tombs of martyrs, adorning them with precious marbles and monumental inscriptions. The inscriptions he composed himself, in mediocre verse, full of Virgilian reminiscences. Several have come down to us on the original marbles, entire or in fragments; others are known from old copies. In the interior of Rome he erected or embellished the church which still bears his name (S. Lorenzo in Damaso), near which his father’s house appears to have stood.

The West was recovering gradually from the troubles caused by the Arian crisis. Damasus took part, more or less effectually, in the efforts to eliminate from Italy and Ilyria the last champions of the council of Rimini. In spite of his declaration at the council convened by him in 372, he did not succeed in evicting Auxentius from Milan. But Auxentius died soon afterwards, and his successor, Ambrose, undertook to bring these hitherto abortive efforts to a successful conclusion, and to complete the return of Ilyria to the confessions of Nicaea. The bishops of the East, however, under the direction of St Basil, were involved in a struggle with the emperor Valens, whose policy was favourable to the council of Rimini. Damasus, to whom they appealed for help, was unable to be of much service to them, the more so because that episcopal group, viewed askance by St Athanasius and his successor Peter, was incessantly combated at the papal court by the invertebrate hatred of Alexandria. The Eastern bishops triumphed in the end under Theodosius, at the council of Constantinople (381), in which the pope and the Western church took no part. They were invited to a council of wider convocation, held at Rome in 385, but very few attended.

This council had brought to Rome the learned monk Jerome, for whom Damasus showed great esteem. To him Damasus dedicated the Latin text of the Bible and other works of religious erudition. A short time before, the pope had received a visit from the Priscillianists after their condemnation in Spain, and had dismissed them. Damasus died in 384, on the 11th of December, the day on which his memory is still celebrated.

Damasus II., pope from the 17th of July to the 9th of August 1048, was the ephemeral successor of Clement II. His original name was Poppo, and he was bishop of Brixen when the emperor Henry III. raised him to the papacy. (L. D.*

DAMAUN or DAMAN, a town of Portuguese India, capital of the settlement of Damaun, situated on the east side of the entrance of the Gulf of Cambay within the Bombay Presidency. The area of the settlement is 82 sq. m. Pop. (1900) 41,671. The settlement is divided into two parts, Damaun proper, and the larger sargana of Nagar Havil, the two being separated by a narrow strip of British territory. The soil is fertile, and rice, wheat and tobacco are the chief crops. The teak forests are valuable. Weaving is an industry less important than formerly; mats and baskets are manufactured, and deep-sea fishing is an
important industry. The shipbuilding business at the town of Damaun is important. Early in the 19th century a large transit trade in opium between Karachi and China was carried on at Damaun, but it ceased in 1837, when the British prohibited it after their conquest of Sind. The settlement is administered as a unit, and has a municipal chamber.

Damaun town was sacked and burnt by the Portuguese in 1531. It was subsequently rebuilt, and in 1558 was again taken by the Portuguese, who made a permanent settlement and converted the mosque into a Christian church. From that time it has remained in their hands. The territory of Damaun proper was conquered by the Portuguese in 1559; that of Nagar Havili was ceded to them by the Maharrattas in 1780 in indemnification for piracy.

DAME (through the Fr. from Lat. domina, mistress, lady, the feminine of dominus, master, lord), properly a name of respect or a title equivalent to "lady," now surviving in English as the legal designation of the wife or widow of a baronet or knight and prefixed to the Christian name and surname. It has also been used in modern times by certain societies or orders, e.g., the Primrose League, as the name of a certain rank among the lady members, answering to the male rank of knight. The ordinary use of the word by itself is for an old woman. As meaning "mistress," i.e., teacher, "dame" was used of the female keepers of schools for young children, which have become obsolete since the advance of public elementary education. At Eton College boarding-houses kept by persons other than members of the teaching staff of the school were known as "Dames' Houses," though the head might not necessarily be a lady. As a term of address to ladies of all ranks, from the sovereign down, "madam," shortened to "ma'am," represents the French madame, my lady.

"Damsel," a young girl or maiden, now only used as a literary word, is taken from the Old French dameiselle, formed from dame, and parallel with the popular donzel or doncele from the medieval Latin doncel or donciscel, diminutive of dominus. The French damoiselle and demoiselle are later formations. The English literary form "damsel" was another importation from France in the 15th century. In the early middle ages damoisel, medieval Latin domicellas, dameiselle, damoiselle, domicella, were used as titles of honour for the unmarried sons and daughters of royal persons and lords (seigneurs). Later the damoisel (in the south donzel, in Bharn domengar) was specifically a young man of gentle birth who aspired to knighthood, equivalent to kuyyer, esquire, or volet (q.v.). The damoiselle performed certain functions and received training in knightly accomplishments in the domestic service of his lord. Later again the name was also used of nobles who had not been knighted. In certain seigneuries in France, notably in that of Commercy, in Lorraine, damoiselle became the permanent title of the holder. In England the title, when used by the French-speaking nobility and members of the court, was only applied to the son or grandchild of the king; thus in the Laws of Edward the Confessor, quoted in Du Cange (Glossarium, s.v. Domicellus), we find "Rex vero Edaram ... pro filio nutritiv et quia cognitiv ipsum hereedam facere, nominavit Ethelking, quo nolimus Domicellum, id. Domesell; sed nos inindiscere de pluribus dicimus, qua Barounum filios vocamus domicellos, Angli vero nollos nisi natos regum." Froissart calls Richard II. during the lifetime of his father the Black Prince, le jeune Domesel. The use of damoiselle followed much the same development; it was first applied to the unmarried daughters of royal persons and seigneurs, then to the wife of a damoisel, and also to the young ladies of gentle birth who performed for the wives of the seigneurs the same domestic services as the damoiselle for their husbands. Hence the later form demoiselle became merely the title of address of a young unmarried lady, the mademoiselle of modern usage, the English "miss." At the court of France, after the 17th century, Mademoiselle without the name of the lady, was a courtesy title given to the eldest daughter of the eldest brother of the king, who was known as Monsieur. To distinguish the daughter of Gaston d'Orléans, brother of Louis XIII., from the daughter of Philippe d'Orléans, brother of Louis XIV., the former, Anne Marie Louise, duchesse de Montpensier, was called La Grande Mademoiselle, by which title she is known to history (see Montpensier, A. M. L., Duchesse de).

DAME'S VIOLET, the English name for Hesperis matronalis, a herbaceous plant belonging to the natural order Cruciferae, and closely allied to the wallflower and stock. It has an erect stout leafy stem 2 to 3 ft. high, with irregularly toothed short-stalked leaves and white or lilac flowers, ½ in. across, which are scented in the evening (hence the name of the genus, from the Gr. ἐνερείς, evening). The slender pods are constricted between the seeds. The plant is a native of Europe and temperate Asia, and is found in Britain as an escape from gardens, in meadows and plantations.

DAMGHAN, a town of Persia in the province of Semnan va Damghan, 216 m. from Teheran on the high-road thence to Khorasan, at an elevation of 3770 ft. and in 36° 10' N., 54° 20' E. Pop. about 10,000. There are post and telegraph offices, and the transit trade is done in pistachios and almonds, the latter being of the kind called Kaghka ("of paper") with very thin shells, famous throughout the country. Damghan was an important city in the middle ages, but then a ruined mosque with a number of massive columns and some fine wood carvings and two minarets of the 11th century remain of that period. Near the city, a few miles south and south-west, are the remains of Hecatontypios, extending from Frat, 16 m. south of Damghan, to near Gûsheh, 20 m. west. Damghan was destroyed by the Afghans in 1723. On an eminence in the western part of the city are the ruins of a large square citadel with a small white-washed building, called Mâlûd Khané (the house of birth), in which Fath Ali Shah was born (1772).

DAMIANI, PIETRO (c. 1007-1072), one of the most celebrated ecclesiastics of the 11th century, was born at Ravenna, and after a youth spent in hardship and privation, gained some renown as a teacher. About 1035, however, he deserted his secular career and entered the hermitage of Fonte Avellana, near Gubbio; and winning sound reputation through his pious and his preaching, he became the head of this establishment about 1043. A zealot for monastic and clerical reform, he introduced a more severe discipline, including the practice of flagellation, into the house, which, under his rule, quickly attained celebrity, and became a model for other foundations. Extending the area of his activities, he entered into communication with the emperor Henry III., addressed to Pope Leo IX. in 1049 a writing denouncing the vices of the clergy and entitled Liber Gomorrhianus; and soon became associated with Hildebrand in the work of reform. As a trusted counsellor of a succession of popes he was made cardinal bishop of Ostia, a position which he accepted with some reluctance; and presiding over a council at Milan in 1059, he courageously asserted the authority of Rome over this province, and won a signal victory for the principles which he advocated. He rendered valuable assistance to Pope Alexander II. in his struggle with the anti-pope, Honorius II. and having served the papacy as legate to France and to Florence, he was allowed to resign his bishopric in 1067. After a period of retirement at Fonte Avellana, he proceeded in 1069 as papal legate to Germany, and persuaded the emperor Henry IV. to give up his intention of divorcing his wife Bertha. During his concluding years he was not altogether in accord with the political ideas of Hildebrand. He died at Faenza on the 22nd of February 1072. Damiani was a determined foe of simony, but his fiercest wrath was directed against the married clergy. He was an extremely vigorous controversialist, and his Latin abounds in denunciatory epithets. He was specially devoted to the Virgin Mary, and wrote an Officium Beatae Virginis, in addition to many letters, sermons, and other writings.

His works were collected by Cardinal Cajetan, and were published in four volumes at Rome (1666-1675), and then at Paris in 1642, at Venice in 1743, and there are other editions. See A. Vogel, Peter Damian (Jena, 1856); A. Cepecellato, Storia di S. Pietro Damian (Florence, 1862); F. Neurich, Das Leben des Peter Damian (Göttingen, 1875); L. Guerrier, De Pietro Damianio (Orleans, 1881); W. von Giesebrecht, Geschichte der deutschen Kaiserzeit.
DAMIEN, the name in religion of JOSEPH DE VEUSTER (1840-1889), Belgian missionary, was born at Tremeloo, near Louvain, on the 3rd of January 1840. He was educated for a business career, but in his eighteenth year entered the Church, joining the Society of the Sacred Heart of Jesus and Mary (also known as the Picpus Congregation), and taking Damien as his name in religion. In October 1863, while he was still in minor orders, he went out as a missionary to the Pacific Islands, taking the place of his brother, who had been prevented by an illness. He reached Honolulu in March 1864, and was ordained priest in Whitsun tide of that year. Struck with the sad condition of the lepers, whom it was the practice of the Hawaiian government to deport to the island of Molokai, he conceived an earnest desire to mitigate their lot, and in 1873 volunteered to take spiritual charge of the settlement at Molokai. Here he remained for the rest of his life, with occasional visits to Honolulu, until he became stricken with leprosy in 1885. Besides attending to the spiritual needs of the lepers, he managed, by the labour of his own hands and by appeals to the Hawaiian government, to improve materially the water-supply, the dwellings, and the sick calling of the settlement. For five years he worked alone; subsequently other resident priests from time to time assisted him. He succumbed to leprosy on the 15th of April 1889. Some ill-considered imputations upon Father Damien by a Presbyterian minister produced a memorable tract by Robert Louis Stevenson (An Open Letter to the Rev. Dr Hyde, 1890).

See also lives by E. Clifford (1889) and Fr. Pamphile (1889).

DAMIENS, ROBERT FRANÇOIS (1715-1757), a Frenchman who attained notoriety by his attack on Louis XV. of France in 1757, was born in a village near Arras in 1715, and early enlisted in the army. After his discharge, he became a menial in the college of the Jesuits in Paris, and was dismissed from this as well as from other employments for misconduct, his conduct earning for him the name of Robert le Diable. During the disturbances of Clement XI. with the parlement of Paris the mind of Damiens seems to have been excited by the ecclesiastical disorganization which followed the refusal of the clergy to grant the sacraments to the Jansenists and Convulsionnaires; and he appears to have thought that peace would be restored by the death of the king. He, however, asserted, perhaps with truth, that he only intended to frighten the king without wounding him severely. On the 5th of January 1757, as the king was entering his carriage, he rushed forward and stabbed him with a knife, inflicting only a slight wound. He made no attempt to escape, and was at once seized. He was condemned as a recidivist, and sentenced to be torn in pieces by horses in the Place de Grève. Before being put to death he was barbarously tortured with red-hot pincers, and molten wax, lead, and boiling oil were poured into his wounds. After his death his house was razed to the ground, his brothers and sisters were ordered to change their names, and his father, wife, and daughter were banished from France.

See Pièces originales et procédés du procès fait à Robert François Damien (Paris, 1757).

DIAMETTA, a town of Lower Egypt, on the eastern (Damietta or Phatnitic) branch of the Nile, about 12 m. above its mouth, and 125 m. N.N.E. of Cairo by rail. Pop. (1907) 29,354. The town is built on the east bank of the river between it and Lake Menzala. Though in general ill-built and partly ruinous, the town possesses some fine mosques, with lofty minarets, public baths and busy bazaars. Along the river-front are many substantial houses furnished with terraces, and with steps leading to the water. Their wooden lattices of saw-work are very graceful. After Cairo and Alexandria, Damietta was for centuries the largest town in Egypt, but the silting up of the entrance to the harbour, the rise of Port Said, and the remarkable development of Alexandria have robbed Damietta of its value as a port. It has still, however, a coasting trade with Syria and the Levant. Ships over 6 ft. draught cannot enter the river, but must anchor in the offing. Lake Menzala yields large supplies of fish, which are dried and salted, and these, with rice, furnish the chief articles of trade.

Damietta is a Levantine corruption of the Coptic name Tamiat. Arabic Dimyat. The original town was 4 m. nearer the sea than the modern city, and first rose into importance on the decay of Pelusium. When it passed into the hands of the Saracens it became a place of great wealth and commerce, and, as the eastern bulwark of Egypt, was frequently attacked by the crusaders. The most memorable of these sieges lasted eighteen months, from June 1218 to November 1219, and ended in the capture of the town, which was, however, held but for a brief period. In June 1240 Louis IX. of France occupied Damietta without opposition, but being defeated near Mansura in the February following, and compelled (6th April) to surrender himself prisoner, Damietta was restored to the Moslems as part of the ransom exacted. To prevent further attacks from the sea the Mameluke sultan Bibars blocked up the Phatnic mouth of the Nile (about 1260), razed old Damietta to the ground, and transferred the inhabitants to the site of the modern town. It continued to be a place of commercial importance for a considerable period, until in fact Port Said gave the eastern part of the Delta a better port. Damietta gives its name to dimity, a kind of striped cloth, for which the place was at one time famous. Cotton and silk goods are still manufactured here.

DAMIRI, the common name of KAMĀL UD-DĪN MUḥAMMAD IBN MŪSĀ UD-DAMIRI (1344-1490), Arabic writer on canon law and natural history, belonged to one of the towns called Damira near Damietta and spent his life in Egypt. Of the Shi‘ite school of law, he became known of tradition in the Rūbūnīya at Cairo, and also at the mosque el-Azhār; in connexion with this work he wrote a commentary on the Minhāj ut-Talībīn of Nawāwī (q.s.). He is, however, better known in the history of literature for his Life of Animals (Hayāt-ul-Hayawan), which treats in alphabetical order of 95 animals mentioned in the Koran, the traditions and the poetical and proverbial literature of the Arabs. The work is a compilation from over 500 prose writers and nearly 200 poets. The correct spelling of the names of the animals is given with an explanation of their meanings. The use of the animals in medicine, their lawfulness or unlawfulness as food, their position in folk-lore are the main subjects treated, while occasionally long irrelevant sections on political history are introduced.

The work exists in three forms. The fullest has been published several times in Egypt: a mediate and a short recension exist in manuscript. Several editions have been made at various times of extracts and portions only of the work, which was translated into Latin by A. Ecchelensis (Paris, 1667). Bochartus in his Hierosolymon (1663) used Damiri's work. There is a translation of the whole into English by Lieutenant-Colonel Jayakar (Bombay, 1906-1908).

DAMIRON, JEAN PHILIBERT (1794-1862), French philosopher, was born at Belleville. At nineteen he entered the normal school, where he studied under Burnouf, Villemain, and Monge. After leaving this school, he was sent to provincial towns; he came to Paris, where he lectured on philosophy in various institutions, and finally became professor in the normal school, and titular professor at the Sorbonne. In 1824 he took part with P. F. Dubois and Th. S. Jouffroy in the establishment of the Globe; and he was also a member of the committee of the society which took for its motto Aide-toi, le ciel t'aidera. In 1833 he was appointed chevalier of the Legion of Honour, and in 1836 member of the Academy of Moral Sciences. Damiron died at Paris on the 11th of January 1862.

The chief works of Damiron, of which the best are his accounts of French philosophers, are the following:—An edition of the Nouveaux mélanges philosophiques de Jouffroy (1842), with a notice of the author, in which Damiron softened and omitted several expressions used by Jouffroy, which were opposed to the system of education adopted by the Sorbonne, an article which gave rise to a bitter controversy, and to a book by Pierre Leroux, De la mutilation des manuscrits de M. Jouffroy (1843): Essai sur l'histoire de la philosophie en France au XIXe siècle (1828, 3rd ed.)
DAMJANICH—DAMOCLES

1834); Essai sur l’histoire de la philosophie en France au XVII. siècle (1846); Mémoires à servir pour l’histoire de la philosophie en France au XVII. siècle (1855-1854); Cours de la philosophie; De la Providence (1840, 1850).

See A. Franck, Moralistes et philosophes (1827).

DAMJANICH, JÁNOS (1804–1849), Hungarian soldier, was born at Stása in the Banat. He entered the army as an officer in the 61st regiment of foot, and on the outbreak of the Hungarian war of independence was promoted to be a major in the third Honvéd regiment at Szeged. Although an orthodox Serb, he was from the first a devoted adherent of the Magyar liberals. He won his colonelcy by his ability and valour at the battles of Alünbrag and Lägerdorf in 1848. At the beginning of 1849 he was appointed commander of the 3rd army corps in the middle Thess, and quickly gained the reputation of being the bravest man in the Magyar army, winning engagement after engagement by sheer dash and daring. At the beginning of March 1849 he annihilated a brigade at Szolnök, perhaps his greatest exploit. He was elected deputy for Szolnök to the Hungarian diet, but declined the honour. Damjanich played a leading part in the general advance upon the Hungarian capital under Görgei. He was present at the battle of Szentendre, at the fortifications of Hort and Hatvan he supported the doubtful fight of Tápió-Bicsk into a victory, and fought with irresistible élan at the bloody battle of Ísaszeg. At the ensuing review at Gődöllő, Kossuth expressed the sentiments of the whole nation when he doffed his hat as Damjanich’s battalions passed by. Always a fiery democrat, Damjanich uncompromisingly supported the extremist views of Kossuth, and was appointed commander of one of the three divisions which, under Görgei, entered Vác in April 1849. His fame reached its culmination when, on the 10th of April, he won the battle of Nagysaró, which led to the relief of the hard-pressed fortress of Komárom. At this juncture Damjanich broke his leg, an accident which prevented him from taking part in field operations at the most critical period of the war, when the Magyars had to abandon the capital for the second time. He recovered sufficiently, however, to accept the post of commandant of the fortress of Arad. After the Világos catastrophe, Damjanich, on being summoned to surrender, declared he would give up the fortress to a single company of Cossacks, but would defend it to the last drop of his blood against the whole Austrian army. He accordingly surrendered to the Russian general Demitrius Buturlin (1790–1849), by whom he was handed over to the Austrians, who shot him in the market-place of Arad a few days later.

See Ódón Hamvay, Life of János Damjanich (Hung.), (Budapest, 1904). (R. N. B.)

DAMMAR, or DAMMER (Hind. dammar = resin, pitch), a resin, or rather series of resins, obtained from various coniferous trees of the genus Dammara (Agathis). East Indian dammar or cat’s eye resin is the produce of Dammara orientalis, which grows in Java, Sumatra, Borneo and other eastern islands and sometimes attains a height of 80–100 ft. It oozes in large quantities from the tree in a soft viscous state, with a high gummy odour, which, however, loses as it hardens by exposure. The resin is much esteemed in oriental communities for incense-burning. Dammar is imported into England by way of Singapore; and as found in British markets it is a hard, transparent, brittle, straw-coloured resin, destitute of odour. It is readily soluble in ether, benzol and chloroform, and with oil of turpentine it forms a fine transparent varnish which dries clear, smooth and hard. The allied kauri gum, or dammar of New Zealand (Australian dammar), is produced by Dammara australis, or kauri-pine, the wood of which is used for wood-paving. Much of the New Zealand resin is found fossil in circumstances analogous to the conditions under which the fossil copal of Zanzibar is obtained. Dammar is besides a generic Indian name for various other resins, which, however, are little known in western commerce. Of these the principal are black dammar (the Hindustani kalo-damar), yielded by Canarium strictum, and white dammar, Indian copal, or piney varnish (sufed-damar), the produce of Valeria indica. Sal dammar (damar) is obtained from Shorea robusta; Hoepa micrantha is the source of rock dammar (the Malay dammer-bats); and other species yield resins which are similarly named and differ little in physical properties.

DAMMARTIN, a small town of France, in the department of Seine et Marne, 22 m. N.E. of Paris. It is well situated on a hill forming part of the plateau of la Goële, and is known as Dammartin-en-Goële to distinguish it from Dammartin-sous-Tiges, a small commune in the same department. Dammartin is historically important as the seat of a countship of which the holders played a considerable part in French history. The earliest recorded count of Dammartin was a certain Hugh, who made himself master of the town in the 10th century; but his dynasty was replaced by another family in the 11th century. Reynald I. (Renaud), count of Dammartin (d. 1227), who was one of the coalition crushed by King Philip Augustus at the battle of Bouvines (1214), left two co-heiresses, of whom the elder, Maud (Matilda or Mahaut), married Philip Hurepel, son of Philip Augustus, and the second, Alix, married Jean de Trie, in whose line the countship was reunited after the death of Philip Hurepel’s son Albert. The countship passed, through heiresses, to the houses of Faye and Nanteuil, and in the 15th century was acquired by Antoine de Chabannes (d. 1488), one of the favourites of King Charles VII., by his marriage with Marguerite, heiress of Reynald V. of Nanteuil-Aci and Marie of Dammartin. This Antoine de Chabannes, count of Dammartin in right of his wife, fought under the standard of Joan of Arc, became a leader of the Écorcheurs, took part in the war of the public weal against Louis XI., and then fought for him against the Burgundians. The collegiate church at Dammartin was founded by him in 1480, and his tomb and effigy are in the chancel. His son, Jean de Chabannes, left three heiresses, of whom the second left a daughter who brought the countship to Philippe de Bouainvilliers, by whose heirs it was sold in 1554 to the dukes of Montmorency. In 1682 the countship was confiscated by Louis XIII. and bestowed on the princes of Condé.

DAMME, a decayed city of Belgium, 5 m. N.E. of Bruges, once among the most important commercial ports of Europe. It is situated on the channel from Bruges to Sluys (Ecluse), but in the middle ages a navigable channel or river called the Zwijn gave ships access to it from the North Sea. The great naval battle of Sluys, in which Edward III. destroyed the French fleet and secured the command of the channel, was fought in the year 1340 at the mouth of the Zwijn. About 1305 this channel began to show signs of silting up, and during the next hundred years the process proved rapid. In 1490 a treaty was signed at Damme between the people of Bruges and the archduke Maximilian, and very soon after this event the channel became completely closed up, and the foreign merchant gilds or “nations” left the place for Antwerp. This signified the death of the port and was indirectly fatal to Bruges as well. The marriage of Charles the Bold and Margaret of York, sister of Edward IV., was celebrated at Damme on the 2nd of July 1468. It will give some idea of the importance which it had in its own maritime law, known as Droit maritime de Damme. The new ship canal from Zeerbrugge will not revive the ancient port, as it follows a different route, leaving Damme and Ecluse quite untouched. Damme, although long neglected, preserves some remains of its former prosperity, thanks to its remoteness from the area of international strife in the Low Countries. The tower of Notre Dame, dating from 1180, is a landmark across the dunes, and the church behind it, although a shell, merits inspection. Out of a portion of the ancient markets a hôtel-de-ville of modest dimensions has been constructed, and in the hospital of St Jean are a few pictures. Camille Lemonnier has given in one of his Coursiers a striking picture of this faded scene of former greatness, now a solitude in which few residents seem spectres rather than living figures.

DAMOCLES, one of the courtiers of the elder Dionysius of Syracuse. When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have invited him to a sumptuous banquet, at which he found himself seated under

DAMOCLES, one of the courtiers of the elder Dionysius of Syracuse. When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have invited him to a sumptuous banquet, at which he found himself seated under
a naked sword suspended by a single hair (Cicero, *Tusc. v. 21; Horace, *Odes*, i. 1, 17; Persius iii. 40).

**DAMOH**, a town and district of British India, in the Jubbulpore division of the Central Provinces. The town has a railway station, 48 m. E. of Sagar. Pop. (1901) 13,355. It has a considerable cattle-market, and a number of small industries, such as weaving, dyeing and pottery-making.

The *District of Damoh* has an area of 2816 sq. m. Except on the south and east, where the offshoots from the surrounding hills and patches of jungle break up the country, the district consists of open plains of varying degrees of fertility, interspersed with low ranges and isolated heights. The richest tracts lie in the centre. The gentle declivity of the surface and the porous character of the prevailing sandstone formation render the drainage excellent. All the streams flow from south to north. The Sunar and the Bairma, the two principal rivers, traverse the entire length of the district. Little use has been made of any of the rivers for irrigation, though in many places they offer great facilities for the purpose. Damoh was first formed into a separate district in 1861. In 1901 the population was 285,356, showing an increase of 12% in one decade due to famine. Damoh suffered severely from the famine of 1866-1867. Fortunately the famine of 1900 was little felt. A branch of the Indian Midland railway was opened throughout from Sagar to Katni in January 1890.

**DAMON**, of Syracuse, a Pythagorean, celebrated for his disinterested affection for Phintias (not, as commonly given, Pythias), a member of the same sect. Condemned to death by Dionysius the Elder (or Younger) of Syracuse, Phintias begged to be set at liberty for a short time that he might arrange his affairs. Damon pledged his life for the return of his friend; and Phintias faithfully returned before the appointed day of execution. The tyrant, to express his admiration of their fidelity, released both the friends and begged to be admitted to their friendship (Diod. Sic. x. 4; Cicero, *De Off.* iii. 10). Hyginus (F. *Ab. 257*) who is followed by Schiller in his ballad, *Die Bürgerschaft* tells a similar story, in which the two friends are named Meuros and Selinuntius.

**DAMPONPH**, a Greek sculptor of Messena, who executed many statues for the people of Messena, Megalopolis, Aegium and other cities of Peloponnesus. Considerable fragments, including three colossal heads from a group by him representing Demeter, Persephone, Artemis and the giant Anytus, have been discovered on the site of Lycosura in Arcadia, where was a temple of the goddess called "The Mistress." They are preserved in part in the museum at Athens and partly on the spot. Hence there has arisen a great controversy as to the date of the artist, who has been assigned to various periods, from the 4th century B.C. to the 2nd A.D. A good account of the whole matter will be found in Frazer's *Pausanias*, iv. 372-370. Frazer wisely inclines to an early date; it is in fact difficult to find any period, when the cities mentioned were in a position to found temples, later than the time of Alexander.

**DAMP**, a common Teutonic word, meaning vapour or mist (cf. Ger. *Dampf*, steam), and hence moisture. In its primitive sense it persists in the vocabulary of coal-miners. Their "firedamp" (formerly fulminating gas) is marsh gas, which, when mixed with air and exploded, produced "choke damp," "after damp," or "suffocating damp" (carbon dioxide).

"Black damp" consists of accumulations of irrespirable gases, mostly nitrogen, which cause the lights to burn dimly, and the term "white damp" is sometimes applied to carbon monoxide. As a verb, the word means to stifle or check; hence damped vibrations or oscillations are those which have been reduced or stopped, instead of being allowed to die out naturally; the "dampers" of the piano are small pieces of felt-covered wood which fall upon the strings and stop their vibrations as the keys are allowed to rise; and the "dampeter" of a chimney or flue, by restricting the draught, lessens the rate of combustion.

**DAMPIER, WILLIAM** (1652-1715), English buccaneer, navigator and hydrographer, was born at East Coker, Somersetshire, in 1652 (baptized 8th of June). Having early become an orphan, he was placed with the master of a ship at Weymouth, in which he made a voyage to Newfoundland. On his return he sailed to Bantam in the East Indies. He served in 1673 in the Dutch War under Sir Edward Sprague, and was present at two engagements (28th of May; 4th of June); but then fell sick and was put ashore. In 1674 he became an under-manager of a Jamaica estate, but continued only a short time in this situation. He afterwards engaged in the coasting trade, and thus acquired an accurate knowledge of all the ports and bays of the island. He made two voyages to the Bay of Campeachy (1675-1676), and remained for some time with the logwood-cutters, varying this occupation with buccaneering. In 1678 he returned to England, again visiting Jamaica in 1679 and joining a party of buccaneers, with whom he crossed the Isthmus of Darien, spent the year 1680 on the Peruvian coast, and sacking, plundering and burning, made his way down to Juan Fernandez Island. After serving with another privateering expedition in the Spanish Main, he went to Virginia and engaged with a captain named Cook for a privateering voyage against the Spaniards in the South Seas. They cruised in 1682, and the latter year Davis took Bantam, and then proceeded round Cape Horn into the Pacific. Having touched at Juan Fernandez, they made the coast of South America, cruising along Chile and Peru. They took some prizes, and with these they proceeded to the Galapagos Islands and to Mexico, which last they fell in with near Cape Blanco. While they lay here Captain Cook died, and the command devolved on Captain Davis, who, with several other pirate vessels, English and French, raided the west American shores for the next year, attacking Guayaquil, Puebla Nova, &c. At last Dampier, leaving Davis, went on board Swan's ship, and proceeded with him along the northern parts of Mexico as far as southern California. Swan then proposed, as the expedition met with "bad success," to the Mexican coast, to run across the Pacific and return by the East Indies. They started from Cape Corrientes on the 31st of March 1686, and reached Guam in the Ladrones on 24th of May; the men, having almost come to an end of their rations, had decided to kill and eat their leaders next, beginning with the "lusty and fleshy" Swan. After six months' drunkenness and debauchery in the Philippines, the majority of the crew, including Dampier, left Swan and thirty-six others behind in Mindanao, cruised (1687-1688) from Manila to Pulo Condore, from the latter to China, and from China to the Spice Islands and New Holland (the Australian mainland). In March 1688 they were off Sumatra, and in May off the Niocos, where Dampier was marooned (at his own request, as he declares, for the purpose of establishing a trade in ambergris) with two other Englishmen, a Portuguese and some Malays. He and his companions contrived to navigate a canoe to Achin in Sumatra; but the fatigues and distress of the voyage proved fatal to several and nearly carried off Dampier himself. After making several voyages to different places of the East Indies (Tongking, Madras, &c.), he acted for some time, and apparently somewhat unwillingly, as gunner to the English fort of Benkulen. Thence he ultimately contrived to return to England in 1691.

In 1690 he was sent out by the English admiralty in command of the "Roebuck," especially designed for discovery in and around Australia. He sailed from the Downs, the 14th of January, with twenty months' provisions, touched at the Canaries, Cape Verdes and Bahia, and ran from Brazil round the Cape of Good Hope direct to Australia, whose west coast he reached on the 26th of July, in about 26° S. lat. Anchoring in Shark's Bay, he began a careful exploration of the neighbouring shore-lands, but found no good harbour or estuary, no fresh water or provisions. In September, accordingly, he left Australia, recruited and refitted at Timor, and thence made for New Guinea, where he arrived on the 3rd of December. By sailing along to its easternmost extremity, he discovered that it was terminated by an island, which he named New Britain (now Neu Pommern), whose north, south and east coasts he surveyed. That St George's Bay was really St George's Channel, dividing the island into two, was not perceived by Dampier; it was the discovery
of his successor, Philip Carteret. Nor did Dampier visit the west coast of New Britain or realize its small extent on that side. He was prevented from prosecuting his discoveries by the dis- content of his men and the state of his ship. In May 1700 he was again at Timor, and thence he proceeded homeward by Batavia (4th July–17th October) and the Cape of Good Hope. In February 1701 he arrived off Ascension Island, when the vessel foundered (21st–24th February), the crew reaching land and staying in the island till the 3rd of April, when they were convoyed to England by some East Indiamen and warships bound for home. In 1703–1707 Dampier commanded two government privateers on an expedition to the South Seas with grievous success; better fortune attended him on his last voyage, as pilot to Woods Rogers in the circumnavigation of 1708–1711. On the former venture Alexander Selkirk, the master of one of the vessels, was marooned at Juan Fernandez; on the latter Selkirk was rescued and a profit of nearly £200,000 was made. But four years before the prize-money was paid Dampier died (March 1715) in St Stephen's parish, Coleman Street, London. Dampier's accounts of his voyages are famous. He had a genius for observation, especially of the scientific phenomena affecting a seaman's life; his style is usually admirable—easy, clear and manly. His knowledge is natural, though not scientific, appearing surprising accurate and trustworthy.

See Dampier's New Voyage Round the World (1697); his Voyages and Descriptions (1699), a work supplementary to the New Voyage; his Voyage to New Holland in . . . 1699 (1703, 1709); also Funnel's Narrative of the Voyage of 1703–1707; Dampier's Vindication of his Voyage (1707); Welb. 's Answer to Captain Dampier's Vindication (Wars Rogers, 1704–05, 1712). (C. B. R.)

DAN (from a Hebrew word meaning "judge"), a tribe of Israel, named after a son of Jacob and Bilhah, the maid of Rachel. The meaning of the name (referred to in Gen. xxx. 5 seq., xlvi. 16) connects Dan with Dinah ("judgment"), the daughter of Leah, whose story in Gen. XXXIV. (cf. xlvi. 5 seq.) seems to point to an Israelite occupation of Shechem, a treacherous massacre of its Canaanite inhabitants by Simeon and Levi, and the subsequent scattering of the latter. But, historically, the occupation of Shechem, whether by conquest (Gen. xlviii. 22) or purchase (xxxii. 19), is as obscure as the conquest of central Palestine itself (see Joshua), and the true relation between Dan and Dinah is uncertain. The earliest seats of Dan lay at Zorath, Eshtoal and Kirjath-jearim, west of Jerusalem, whence they were forced to seek a new home, and a valuable narrative detailing some of the events of the move is preserved in the story of the expropriation of the Ephraimitic Micah (v. 5). Laish (Leshem) was taken with the sword and re-named Dan (see below). Here a sanctuary was founded under the guardianship of Jonathan, the grandson of Moses, which survived until the "captive- ness of the land" (1 Kings xlix. 21, cf. 2 Kings xliii. 712), (C. B. R.) Dan formed the northern limit of the land,1 and with Abel-beth-Maachah was an old place renowned for Israelite lore (2 Sam. xxi. 18, on the text see the commentaries). Little can be made of Dan's history. The reference to it as a seafaring folk (Judg. v. 17) is difficult, and it is uncertain whether its character as represented in Gen. xlix. 17, Deut. xxxviii. 22, refers to its earlier or later seat. The post-exilic accounts of its southern border would make it part of Judah, and both of them are in tradition the greatest of the tribes in the wanderings in the wilderness. Dan was subsequently either regarded as the embodiment of wickedness or entirely ignored; late speculation that the Antichrist should spring from it appears to be based upon an interpretation of Gen. xlix. 17 (see further R. H. Charles, Testaments of the Twelve Patriarchs, pp. 128 seq.).

A brief record of the Danite migration is found in some old detached fragments which K. Budde (Richter and Samuel) ingeniously arranges thus—Judg. i. 34 (Amorite pressure); Josh. xix. 475 (see the Septuagint), 478; Judg. i. 35. The position of Judg. xvii. seq. (after the stories of Samson) may imply that the Philistines, not the Amorites, caused the migration (cf. 1 Sam. vii. 14, where the two etiologies interchange). The Mosaic priesthood and the reference to Shiloh suggest that the story of Eli may have belonged to this cycle of narratives; and the spoliation of the unknown sanctuary of the Ephraimitic Micah and the character of the fierce Puritan tribesmen connect Dan with the problems of the tribes of Simeon and Levi. Dan's northern home lay near Beth-rehoth, which appears to have been Aramean in David's time (2 Sam. x. 6), and it is possible that the migration has been antedated (cf. similarly the case of Jair, Num. xxxii. 41, Judg. xiii. 3–5). The Tyrian artificer sent to Solomon by Hiram was partly of Danite descent (2 Chron. ii. 13 seq.; but of Naphtali, 1 Kings vii. 14); and of the two workers in brass who took part in the building of the tabernacle in the desert, one was Danite (Oholab, Ex. xxx. 6), while the other appears to have been Calebite (Bezalel, ib. v. 2; 1 Chron. ii. 20). The Kenites, too, have been regarded as a race of metal-workers (see Cain, Kenites), and there is evidence which would show that Danites, Calebites and Kenites were once closely associated in tradition.

See S. A. Cook, Critical Notes, Index, etc.: E Meyer, Israeliten, Ph. Aug. 1864–1865, xlii. 122. (S. A. C.)

DAN, a town of ancient Israel, near the head-waters of the Jordan, inhabited before its conquest by the Danites, a peaceful and virtuous people, who called their city Laish or Leshem. (Josh. xix. 47, Judg. xviii. 31.) It appears to have been founded at this early period a sacred city, the shrine of Micah being removed hither, and it was chosen by Jeroboam as the site of one of his calf-shrines. It makes the north limit of Palestine in the proverbial expression "from Dan to Beersheba." The town was plundered by Benhadad of Damascus, and appears from that time to have gradually declined. Its site is sought in the mound called Tell-el-Kadi, "the hill of the judge" (Dan = "judge" in Hebrew), though wealthy authorities incline to place it 4 m. east of this, at Banias, the old Caesarea Philippi. (See above.)

DANA, CHARLES ANDERSON (1819–1897), American journalist, was born in Hinsdale, New Hampshire, on the 8th of August 1819. At the age of twelve he became a clerk in his uncle's general store at Buffalo, which failed in 1837. In 1839 he entered Harvard, but the impairment of his eyesight in 1841 forced him to leave college, and caused him to abandon his intention of entering the ministry and of studying in Germany. In September 1841 until March 1846 he lived at Brook Farm, where he was made one of the trustees of the farm, was head waiter when the farm became a Fourierite commune, and was in charge of the phalanstery's finances when its building and equipment were burned in 1846. He had previously written for (and managed) the Harbinger, the Brook Farm organ, and had written as early as 1844 for the Boston Chromycope. In 1847 he joined the staff of the New York Tribune, and in 1848 he wrote from Europe letters to it and other papers on the revolutionary movements of that year. Returning to the Tribune in 1849, he became its managing-editor, and in this capacity actively promoted the anti-slavery cause, seeming to shape the paper's policy at a time when Greeley was undecided and vacillating. In 1862 his resignation was asked for by the board of managers of the Tribune, apparently because of wide temperamental differences between him and Greeley. Secretary of War Stanton immediately made him a special investigating agent of the war department; in this capacity Dana discovered frauds of quartermasters and contractors, and as the "eyes of the administration," as Lincoln called him, he spent much time at the front, and sent to Stanton frequent reports concerning the capacity and methods of various generals in the field; he went through the Vicksburg campaign and was at Chickamauga and Chattanooga, and urged the placing of General Grant in supreme command of all the armies in the field. Dana was second assistant-secretary of war in 1864–1865, and in 1865–1866 conducted the newly-established and unsuccessful Chicago Republican. He became the editor and part-owner of the New York Sun in 1868, and remained in control of it until his death at Glen Cove, Long Island, New York.
DANA, F., was educated at Harvard in the class of 1808. Subsequently he studied law and in 1811 was admitted to practice. But all other interests were early subordinated to his love of literature, to which the greater part of his long life was devoted. He became in 1814 a member of a literary society in Cambridge, known as the Anthology Club. This club began the publication of a monthly magazine, The Monthly Anthology, which gave way in 1815 to The North American Review.

In the editorial control of this periodical he was associated with Jared Sparks and Edward T. Channing (1790–1856) until 1821, contributing essays and criticisms which attracted wide attention. In 1821–1822 he edited in New York a short-lived literary magazine, The Idle Man. He published his first volume of Poems in 1827, and in 1833 appeared his Poems and Prose Writings, republished in 1850 in two volumes, in which were included practically all of his poems and of his prose contributions to periodical literature.

Although the bulk of his published writings was not large, his influence on American literature during the first quarter of the 19th century was surpassed by that of few of his contemporaries.

Richard Henry Dana (1815–1882), son of the last-mentioned, was born in Cambridge, Massachusetts, on 8th of January 1815.

He entered Harvard in the class of 1838, but at the beginning of his junior year an illness affecting his sight necessitated a suspension of his college work, and in August 1834 he shipped before the mast for California, returning in September 1836. The rough experience of this voyage did more than endow him with renewed health; it changed him from a dreamy, sensitive boy, hereditarily disinclined to any sort of active career, into a self-reliant, energetic man, with broad interests and keen sympathies. He re-entered Harvard in December 1836 and graduated in June 1837. He was a student at the Harvard law school from 1837 to 1840, and from January 1839 to February 1840 he was also an instructor in elocution in the college. In 1840 the notes of his sea-trip were published under the title Two Years Before the Mast. The book attained an almost unprecedented popularity both in America and in Europe, where it was translated into several languages; and it came to be considered a classic.

Immediately after the appearance of this book Dana began the practice of law, which brought him a large number of maritime cases. In 1841 he published The Seaman's Friend, republished in England as The Seaman's Manual, which was long the highest authority on the legal rights and duties of seamen. After gaining recognition as one of the most prominent members of the Suffolk bar, he became associated in 1848 with the Free Soil movement, and took a prominent part in the Buffalo convention of that year. This step, which caused him to be ostracized for a time from the Boston circles in which he had been reared, brought him the cases of the fugitive slaves, Shadrach, Sims and Burns, and of the rescuers of Shadrach. On the night following the surrender of Burns (May 1854) Dana was brutally assaulted on the Boston streets. In 1853 he took a prominent part in the state constitutional convention. He allied himself with the Republican party on its organization, but his inborn dislike for political maneuvering prevented his ever becoming prominent in its councils.

In 1857 he became a regular attendant at the meetings of the famous Boston Saturday Club, to the members of which he dedicated his account of a vacation trip, To Cuba and Back (1858). He returned to America from a trip round the world in time to participate in the presidential campaign of 1860, and after Lincoln's inauguration he was appointed United States district attorney for Massachusetts. In this office in 1863 he won before the Supreme Court of the United States the famous prize case of the "Amy Warwick," on the decision in which depended the right of the government to blockade the Confederate ports, without giving the Confederate States an international status as belligerents. He brought out in 1865 an edition of Wheaton's International Law, his notes constituting a most learned and valuable authority on international law and its bearings on American history and diplomacy; but immediately after its publication Dana was charged by the editor of two earlier editions, William Beach Lawrence, with infringing his copyright, and was involved in litigation which was continued

On the 17th of October 1807. Under Dana's control the Sun opposed the impeachment of President Johnson; it supported Grant for the presidency in 1868; it was a sharp critic of Grant as president with Lincoln; 1872 took part in the Liberal Republican revolt and urged Greeley's nomination. It favoured Tilden, the Democratic candidate for the presidency, in 1876, opposed the Electoral Commission and continually referred to Hayes as the "fraud president." In 1884 it supported Benjamin F. Butler, the candidate of Greenback-Labor and Anti-Monopolist parties, for the presidency, and opposed Blaine (Republican) and even more bitterly Cleveland (Democrat); it supported Cleveland and opposed Harrison in 1888, although it had bitterly criticized Cleveland's first administration, and was to criticize nearly every detail of his second, with the exception of Federal interference in the Pullman strike of 1894; and in 1896, on the free-silver issue, it opposed Bryan, the Democratic candidate for the presidency. Dana's literary style came to be the style of the Sun—simple, strong, clear, "boiled down." The Art of Newspaper Making, containing three lectures which he wrote on journalism, was published in 1900. With George Ripley he edited The New American Cyclopaedia (15 vols., 1857–1863), reissued as the American Cyclopaedia in 1875–1876. He had excelled as a poet, and edited an anthology, The Household Book of Poetry (1857). It was a very good linguistic, published several versions from the German, and read the Romance and Scandinavian languages; he was an art connoisseur and left a remarkable collection of Chinese porcelain.

Dana's Reminiscences of the Civil War was published in 1868, as was his Eastern Journeys, Notes of Travel. He also edited a campaign Life of U. S. Grant, published over his name and that of General James H. Wilson in 1868.

See James Wilson, The Life of Charles A. Dana (New York, 1907).
for thirteen years. In such minor matters as arrangement of notes and verification of citations, the court found against Dana, but his book’s notes were vastly different in style from Lawrence’s. In 1865 Dana declined an appointment as a United States district judge. During the Reconstruction period he favored the congressional plan rather than that of President Johnson, and on this account resigned the district-attorneyship. In 1867–1868 he was a member of the Massachusetts House of Representatives, and in 1867 was retained with William M. Evarts to prosecute Jefferson Davis, whose admission to bail he counseled. In 1877 he was one of the counsel for the United States before the commission which in accordance with the treaty of Washington met at Halifax, N.S., to arbitrate the fisheries question between the United States and Great Britain. In 1878 he gave up his law practice and devoted the rest of his life to study and travel. He died in Rome, Italy, on the 9th of January 1882.

DANA, JAMES DWIGHT (1813-1895), American geologist, mineralogist and zoologist, was born in Utica, New York, on the 12th of February 1813. He early displayed a taste for science, which had been fostered by Fay Edgerton, a teacher in the Utica high school, and in 1830 he entered Yale College, in order to study under Silvanus Thompson the elder. Graduating in 1833, for the next two years he was teacher of mathematics to midshipmen in the navy, and sailed to the Mediterranean while engaged in his duties. In 1836-1837 he was assistant to Professor Silliman in the chemical laboratory at Yale, and then, for four years, acted as mineralogist and geologist of a United States exploring expedition, commanded by Captain Charles Wilkes, in the Pacific ocean (see Wilkes, Charles). His labours in preparing the reports of his explorations occupied parts of thirteen years after his return to America in 1842. In 1844 he again became a resident of New Haven, married the daughter of Professor Silliman, and in 1856, on the resignation of the latter, was appointed Silliman Professor of Natural History and Geology in Yale College, a position which he held till 1870. In 1865 he became joint editor and during the later years of his life he was chief editor of the American Journal of Science and Arts (founded in 1816 by Benjamin Silliman), to which he was a constant contributor, principally of articles on geology and mineralogy. A bibliographical list of his writings shows 214 titles of books and papers, beginning in 1833 with a paper on the conditions of Vesuvius in 1834, and ending with the fourth revised edition (finished in February 1895) of his Manual of Geology. His reports on Zoophytes, on the Geology of the Pacific Area, and on Crustacea, summarizing his work on the Wilkes expedition, appeared in 1846, 1849 and 1852-1854, in quarto volumes, with copiously illustrated atlases; but as these were issued in small numbers, his reputation more largely rests upon his System of Mineralogy (1845 and many later editions in 1852); Manual of Geology (1855; ed. 4, 1855); Manual of Mineralogy (1848), afterwards entitled Manual of Mineralogy and Lithology (ed. 4, 1887); and Corals and Coral Islands (1873; ed. 2, 1890). In 1887 Dana reviewed the Hawaiian Islands, and the results of his further investigations were published in a quarto volume in 1890, entitled Characteristics of Volcanoes. By the Royal Society of London he was awarded the Copley medal in 1877; and by the Geological Society the Wollaston medal in 1874. His powers of work were extraordinary, and in his 82nd year he was occupied in preparing a new edition of his Manual of Geology, the 4th edition being issued in 1895. He died on the 14th of April 1895.

His son Edward Salisbury Dana, born at New Haven on the 16th of November 1849, is author of A Textbook of Mineralogy (1877; new ed. 1895) and a Text Book of Elementary Mechanics (1881). In 1879-80 he was professor of natural philosophy and then became professor of physics at Yale.

Dana's Life of J. D. Dana, by Daniel C. Gilman (1890).

DANAÉ in Greek legend, daughter of Acrisius, king of Argos. Her father, having been warned by an oracle that she would bear a son by whom he would be slain, confined Danae in a brazen tower. But Zeus descended to her in a shower of gold, and she gave birth to Perseus, whom upon Acrisius placed her and her infant in a wooden box and threw them into the sea. They were finally driven ashore on the island of Seriphus, where they were picked up by a fisherman named Dictys. His brother Polydectes, who was king of the island, fell in love with Danae and married her. According to another story, her son Perseus, on his return with the head of Medusa, finding his mother persecuted by Polydectes, turned him into stone, and took Danae back with him to Argos. Latin legend represented her as landing on the coast of Latium and marrying Pilumus or Picumnus, from whom Turnus, king of the Rutulians, was descended. Danae formed the subject of tragedies by Aeschylus, Sophocles, Euripides, Livius Andronicus and Naevius. She is the personification of the earth suffering from drought, on which the fertilizing rain descends from heaven.

Apollodorus ii. 44; Sophocles, Antigone, 944; Horace, Odes, iii. 15; Ovid, Elex, vii. 410. See also F. Schwarz, De Fabula Danae (1881).

DANAGO, a town of the province of Cebu, island of Cebu, Philippine Islands, on the E. coast, at the mouth of the Danao river, 17 m. N.N.E. of Cebu, the capital. Pop. (1905) 16,773. Danago has a comparatively cool and healthy climate, is the centre of a rich agricultural region producing rice, Indian corn, sugar, copra and cacao, and coal is mined in the vicinity. The language is Cebú-Visayan.

DANAUS, in Greek legend, son of Belus, king of Egypt, and twin-brother of Aegyptus. He was born at Chemnis (Panopolis) in Egypt, but having been driven out by his brother he fled with his fifty daughters to Argos, the home of his ancestress Io. Here he became king and taught the inhabitants of the country to dig wells. In the meantime the fifty sons of Aegyptus arrived in Argos, and Danaus was obliged to consent to their marriage with his daughters. But to each of these he gave a knife with injunctions to slay her husband on the marriage night. They all obeyed except Hypermnestra, who spared Lyneus. She was brought to trial by her father, acquitted and afterwards married to her lover. Being unable to find suitors for the other daughters Danaus offered them in marriage to the youths of the district who proved themselves victorious in racing contests (Pindar, Pythia, ix. 117). According to another story, Lynceus slew Danaus and his daughters and seized the throne of Argos (schol. on Euripides, Hecuba, 886). By way of expiation for their crime the Danaïdes were condemned to the endless task of filling with water a vessel which had no bottom. This punishment, originally inflicted on those who neglected certain mystic rites, was transferred to those who, like the Danaïdes, despised the mystic rite of marriage: cf. the water-bearing figure (λαυρωδόφορος) on the grave of unmarried persons. The murder of the sons of Aegyptus by their wives is supposed to represent the drying up of the rivers and springs of Argolis in summer by the agency of the nymphs.

DANBURITE, a rare mineral species consisting of calcium and bromine orthosilicate, (CaBr)O, crystallizing in the orthorhombic system. It was discovered by C. Steinitz in 1839 at Danbury, Connecticut, U.S.A., and named by him after this locality. The crystals are prismatic in habit, and closely resemble topaz in form and interfacial angles. There is an imperfect cleavage parallel to the basal plane. Crystals are transparent to translucent, and colourless to pale yellow; hardness 7; specific gravity 3.0. At Danbury the mineral occurs with microcline and oligoclase embedded in dolomite. Large crystals, reaching 4 in. in length, have been found with calcite in veins traversing granite at Russell in St Lawrence county, New York. Smaller but well-developed crystals have been found on gneiss at Mt. Scoi and Petersthal (the valley of the Vals Rhine) in Switzerland. Splendid crystals have recently been obtained from Japan.

DANBURY, a city and one of the county-seats of Fairfield county, Connecticut, U.S.A., in Danbury township, in the
DANBY—DANCE

south-west part of the state, on the Still river, a tributary of the Housatonic. Pop. (1800) 16,552; (1900) 16,537 (3702 foreign-born); (1910) 20,234. In 1900 the population of the township, including that of the city, was 19,474, and in 1910, 23,502. Danbury is served by three divisions of the New York, New Haven & Hartford railway; by the Danbury & Harlem electric railway, which connects at Goldens Bridge, New York, with the Harlem division of the New York Central; and by an electric line to Bethel, Connecticut. Lake Kenosha, about 2½ m. from the centre of the city, is a pleasure resort. A state normal school was opened in Danbury in 1904, and there is a home for destitute and homeless children under private (sequestered) control. The city has good water-power, and the municipality owns the water works. The principal industry is the manufacture of felt hats, begun in 1875, and in 1915 engaging about thirty factories, with a product for the year valued at $5,998,107 (71¾% of the value of all the factory products of the city, and 15.8% of the value of all the felt hats produced in the United States). Of the city ranked first among the cities of the country in this industry in 1900 and second in 1905, and in 1905 no other city showed so high a degree of specialization in it. Silver-plated ware (mostly manufactured by Rogers Bros.) is another important product. At Danbury is held annually the well-known agricultural Danbury Fair. The township was settled in 1684 by emigrants from Norwalk, and received its present name in 1687. When the War of Independence opened, Enoch Crosby, believed to be the original of Harvey Birch, the hero of J. F. Cooper's The Spy, was a resident of Danbury. A depot of military supplies was established in the village of Danbury in 1776; in April 1777 Governor William Tryon, of New York, raidied the place, destroying the military stores and considerable private property. During his retreat he was attacked (April 26th) at Ridgefield (about 9 m. south by east of Danbury) by the Americans under General David Wooster (1710-1777), who was fatally wounded in the conflict (being succeeded by General Benedict Arnold), and to whose memory a monument was erected in Danbury in 1854. Danbury was chartered as a borough in 1832 and as a city in 1850. In 1870 the Danbury News was established by the consolidation of the Jeffersonian and the Times, by James Montgomery Bailey (1841-1894), from 1865 to 1870 proprietor of the Times. He wrote for the News humorous sketches, which made him and the paper famous, Bailey being known as the "Danbury News Man"; among his books are Life in Danbury (1873), The Danbury News Man's Almanac (1873), They All Do It (1877), England from a Back Window (1878), Mr. Philip's Goneness (1879), The Danbury Boom (1886), and History of Danbury (1890). FRANCIS (1703-1861). English painter, was born in the south of Ireland on the 16th of November 1703. His fatherfarmed a small property he owned near Wexford, but his death caused the family to remove to Dublin, while Francis was still a schoolboy. He began to practice drawing at the Royal Dublin Society's schools; and under an erratic young artist named O'Connor he began painting landscape. Danby also made acquaintance with George Petrie, and all three left for London together in 1813. This expedition, undertaken with very inadequate funds, quickly came to an end, and they had to get home again by walking. At Bristol they made a pause, and Danby, finding he could get trifling sums for water-colour drawings, remained there working diligently and sending to the London exhibitions pictures of importance. There his large pictures in oil quickly attracted attention. "The Ups Tree" (1820) and "The Delivery of the Israelites" (1825) brought him his election as an associate of the Royal Academy. He left Bristol for London, and in 1828 exhibited his "On the Sixth Seal" at the British Institution, receiving from that body a prize of 200 guineas; and this picture was followed by two others from the Apocalypse. He suddenly left London, declaring that he would never live there again, and that the Academy, instead of aiding him, had, somehow or other, used him badly. Some insurmountable domestic difficulty overtook him also, and for eleven or twelve years he lived on the Lake of Geneva, a Bohemian with boat-building fancies, painting only now and then. He returned to England in 1841, when his sons, James and Thomas, both artists, were growing up. Other pictures by him were "The Golden Age" and "The Evening Gun," the first begun before he left England, the second painted after his return; he had taken up his abode at Exmouth, where he died on the 9th of February 1861. DANCE, the name of an English family distinguished in architecture, art and the drama. GEORGE DANCE, the elder (1700-1768), obtained the appointment of architect to the city of London, and designed the Mansion House (1739); the churches of St Botolph, Aldgate (1741), St Luke's, Old Street; St Leonard, Shoreditch; the old excise office; Broad Street; and other public works of importance. He died on the 8th of February 1768. His eldest son, JAMES DANCE (1722-1744), was born on the 17th of March 1722, and educated at the Merchant Taylors' School and St John's, Oxford, which he left before graduating. He took the name of Love, and became an actor and playwright of no great merit. In the former capacity he was for twelve years connected with Drury Lane theatre. He wrote "an heroic poem" on Cricket, about 1740, and a volume of Poems on Several Occasions (1754), and a number of comedies—the earliest Pamela (1745).

George Dance's third son, Sir Nathaniel Dance-Holland, Bart. (1735-1811), was born on the 18th of May 1735, and studied art under Francis Hayman, and in Italy, where he met Angelica Kaufmann, to whom he was devotedly and hopelessly attached. From Rome he sent home "Dido and Aeneas" (1763), and he continued to paint occasional historical pictures of the same quasi-classic kind throughout his career. On his return to England he took up portrait-painting with great success, and contributed to the first exhibition of the Royal Academy, of which he was a foundation member, full-length portraits of George III and his queen. These, and his portraits of Captain Cook and of Garrick as Richard III, engraved by Dixon, are his best-known works. Himself a rich man, in 1790 he married a widow with £15,000 a year, dropped his profession, and became M.P. for East Grinstead, taking the additional name of Holland. He was made a baronet in 1800. He died on the 15th of October 1811, leaving a fortune of £200,000.

George Dance's fifth and youngest son, GEORGE DANCE, the younger (1741-1823), succeeded his father as city surveyor and architect in 1768. He was then only twenty-seven, had spent several years abroad, chiefly in Italy with his brother Nathaniel, and had already distinguished himself by designs for Blackfriars Bridge sent to the 1761 exhibition of the Incorporated Society of Artists. His first important public work was the rebuilding of Newgate prison in 1770. The front of the Guildhall was also his. He, too, was a foundation member of the Royal Academy, and for a number of years the last survivor of the forty original academicians. His last years were devoted to art rather than to architecture, and after 1798 his Academy contributions consisted solely of chalk portraits of his friends, seventy-two of which were engraved and published (1808-1814). He resigned his office in 1815, and after many years of illness died on the 14th of January 1825, and was buried in St Paul's. His son, CHARLES DANCE (1794-1863), was for thirty years registrar, taxing officer and chief clerk of the insolvent debtors' court, retiring, when it was abolished, on an allowance. In collaboration with J. R. Planché and others, or alone, he wrote a great number of extravaganzas, farces and comediettas. He was one of the first, if not the first, of the burlesque writers, and was the author of those produced so successfully by Madame Vestris for years at the Olympic. Of his farces, Delicate Ground, Who Speaks First?, A Morning Call and others were still occasionally revived. He died on the 6th of January 1863. DANCE (Fr. danse; of obscure origin, connected with Old High Ger. danon, to stretch). The term "dancing" in its widest sense includes three things: (1) the spontaneous activity of the muscles under the influence of some strong emotion, such as social joy or religious exultation; (2) definite combinations of graceful movements performed for the sake of the pleasure
which the exercise affords to the dancer or to the spectator; (3) carefully trained movements which are meant by the dancer vividly to represent the actions and passions of other people. In the highest sense it seems to be for prose-gesture what song is for the instinctual exclamations of feeling. Regarded as the outlet or expression of strong feeling, dancing does not require much discussion, for the general rule applies that such demonstrations for a time at least sustain and do not exhaust the flow of feeling. The voice and the facial muscles and many of the organs are affected at the same time, and the result is a high state of vitality which among the spinning Dervishes or in the ecstatic worship of Bacchus and Cybele amounted to something like madness. Even here there is traceable an undulatory movement which, as Herbert Spencer says, is "habitually generated by feeling in its bodily discharge." But it is only in the advanced or volitional stage of dancing that we find developed the essential feature of measure, which has been said to consist in "the alternation of stronger muscular contractions with weaker ones," an alternation which, except in the cases of savages and children, "is compounded with longer rises and falls in the degree of muscular excitement." In analysing the state of mind which this measured dancing produces, we must first of all allow for the pleasant glow of excitement caused by the excess of blood sent to the brain. But apart from this, there is an agreeable sense of uniformity in the succession of muscular efforts, and in the spaces described, and also in the period of their recurrence. If the steps of dancing and the intervals of time be not precisely equal, there is still a pleasure depending on the gradually increasing intensity of motion, on the undulation which uniformly rises in order to fall. As Florizel says to Perdita, "When you do dance, I wish you a wave of the sea" (Winter's Tale, iv. 3). The mind feels the beauty of emphasis and cadence in muscular motion, just as much as in musical notes. Then, the figure of the dance is frequently a circle or some more graceful curve or series of curves, that mark the trace which the dancer makes in the eye of the spectator. But all such effects are intensified by the use of music, which not only brings a perfectly distinct set of pleasurable sensations to dancer and spectator, but by the control of dancing produces an inexpressibly sweet harmony of sound and motion. This harmony is further enriched if there be two dancing together on one plan, or a large company of dancers executing certain evolutions, the success of which depends on the separate harmonies of all the couples. The fundamental condition is that throughout the dance all the dancers keep within their bases of gravity. This is not only required for the dancers' own enjoyment, but, as in the famous Mercury on tiptoe, it is essential to the beautiful effect for the spectator. The idea of much being safely supported by little is what proves attractive in the posturing ballet. But this is merely one condition of graceful dancing, and if it be made the chief object the dancer sinks into the acrobats.

Dancing is, in fact, the universal human expression, by movements of the limbs and body, of a sense of rhythm which is implanted among the primitive instincts of the animal world. The rhythmical principle of motion extends throughout the universe, governing the lapse of waves, the flow of tides, the reverberations of light and sound, and the movements of celestial bodies; and in the human organism it manifests itself in the automatic pulses and flexions of the blood and tissues. Dancing is merely the voluntary application of the rhythmical principle, when excitement has induced an abnormally rapid oxidization of brain tissue, to the physical exertion by which the overcharged brain is relieved. This is primitive dancing; and it embraces all movements of the limbs and body expressive of joy or grief, all pantomimic representations of incidents in the lives of the dancers, all performances in which movements of the body are employed to excite the passions of hatred or love, pity or revenge, or to arouse the warlike instincts, and in ceremonies in which such movements express homage or worship, or are used as religious exercises. Although music is not an essential part of dancing, it almost invariably accompanies it, even in the crudest form of a rhythm beaten out on a drum.

Primitive and Ancient Dancing.—In Tigré the Abyssinians dance the chassé step in a circle, and keep time by shrugging their shoulders and working their elbows backwards and forwards. At intervals the dancers squat on the ground, still moving the arms and shoulders in the same way. The Bushmen dance in their low-roofed rooms supporting themselves by sticks; one foot remains motionless, the other dances in a wild irregular manner, while the hands are occupied with the sticks. The Gonds, a hill-tribe of Hindustan, dance generally in pairs, with a shuffling step, the eyes on the ground, the arms close to the body, and the elbows at an angle with the closed hand. Advancing to a point, the dancer suddenly erects his head, and wheels round to the starting point. The women of the Pultooah tribe dance in a circle, moving backwards and forwards in a bent posture. The Santal women, again, are slow and graceful in dancing; joining hands, they form themselves into the arc of a circle, towards the centre of which they advance and then retire, moving at the same time slightly towards the right, so as to complete the circle in an hour. The Kukis of Assam have only the rudest possible step, an awkward hop with the knees very much bent. The national dance of the Kamchadale is one of the most violent known, every muscle apparently quivering at every movement. But there, and in some other cases where men and women dance together, there is a trace of deliberate obscenity; the dance is, in fact, a rude representation of sexual passion. It has been said that some of the Tasmanian corrobories have a phallic design. The Yucatan dance of naval may also be mentioned. The Andamans hop on one foot and swing the arms violently backwards and forwards. The Veddas jump with both feet together, patting their bodies, or clapping their hands, and make a point of bringing their long hair down in front of the face. In New Caledonia the dance consists of a series of twirlings of the body, the feet being lifted alternately, but without change of place. The Fijians jump half round from side to side without raising their feet. The toto modulation of the Samoan dance is one of time—a crescendo movement, which is well-known in the modern ball-room. The Javanese are perhaps unique in their distinct and graceful gestures of the hands and fingers. At a Mexican feast called Huizilopochtli, the noblemen and women danced tied together at the hands, and embracing one another, the arms being thrown over the neck. This resembles the dance variously known as the Greek Bracelet or Brawl, *Opus, or Bearsfoot; but all of them probably are to a certain extent symbolical of the relations between the sexes. Actual contact of the partners, however, is quite intelligible as matter of pure dancing; for, apart altogether from the pleasure of the embrace, the harmony of the double rotation adds very much to the enjoyment. In a very old Peruvian dance of ceremony before the Inca, several hundreds of men formed a chain, each taking hold of the hand of the man beyond his immediate neighbour, and the whole body moving forwards and backwards three steps at a time as they approached the throne. In this, as in the national dance of the Coles of Lower Bengal, there was perhaps a suggestion of "l'union fait la force." In Yucatan stilts were occasionally used for dancing.

It seldom happens that dancing takes place without accompaniment, either by the dancers or by others. This is not merely because the feelings which find relief in dancing express themselves at the same time in other forms; in some cases, indeed, the vocal and instrumental elements largely predominate, and form the ground-work of the whole emotional demonstration. Whether they do so or not will of course depend on the intellectual advancement of the nation or tribe and upon the particular development of their aesthetic sensibility. A striking instance occurs among the Zulus, whose grand dances are merely the accompaniment to the colloquial war and hunting songs, in which the women put questions which are answered by the men. So also in Tahiti there is a set of national ballads and songs, referring to many events in the past and present lives of the

1 Compare the Chica of South America, the Pandango of Spain, and the Angrismene or la Facheé of modern Greece. See also comand de la rote, v. 776.
people. The fisherman, the woodsman, the canoe-builder, has each his trade-song, which on public occasions at least is illustrated by dancing. But the accompaniment is often consciously intended, by an appeal to the ear, to regulate and sustain the excitement of the muscles. And a close relation will be found always to exist between the excellence of a nation’s dancing and the excellence or complexity of its music and poetry. In some cases the performer himself sings or marks time by the clanking of ornaments on his person. In others the accompaniment consists sometimes of a rude chant improvised by those standing round, or of music from instruments, or of mere clapping of the hands, or of striking one stick against another or on the ground, or of “marking time,” in the technical sense. The Tasmanians beat on a rolled-up kangaroo-skin. The Kamchadales make a noise like a continuous hiccough all through the dance. The Andamans use a large hollow dancing-board, on which one man is set apart to stamp. Sometimes it is the privilege of the tribal chief to sing the accompaniment while his people dance. The savages of New Caledonia whistle and strike upon the lip. The rudimentary dances of early civilization are of extreme interest. In the same way the dances of the Ostyak tribes (Northern Asiatic) imitate the habitual sports of the chase and the gambols of the wolf and the bear and other wild beasts, the dancing consisting mainly of sudden leaps and violent thrusts which exhaust the muscular powers of the whole body. The Kamchadales, too, in dancing, imitate bears, dogs and birds. The Kru dances of the Coast Negroes represent hunting scenes; and on the Congo, before the hunters start, they go through a dance imitating the habits of the gorilla and its movements when attacked. The Damara dance is a mimic representation of the movements of oxen and sheep, four men stooping with their heads in contact and uttering harsh cries. The canter of the baboon is the humorous part of the ceremony. The Bushmen dance in long irregular jumps, which they compare to the leaping of a herd of calves, and the Hottentots not only go on all-fours to counterfeit the Baboon, but they have a dance in which the buzzing of a swarm of bees is represented. The Kenniswits in Borneo introduce the misa and the deer for the same purpose. The Australians and Tasmanians in their dances called corrobories imitate the frog and the kangaroo (both leaping animals). The hunt of the emu is also performed, a number of men passing slowly round the fire and throwing their arrows about so as to imitate the movements of the animal’s head while feeding. The Gonds are fond of dancing the bison hunt, one man with skin and horns taking the part of the animal. Closely allied to these are the mimic fights, almost universal among tribes to which war is one of the greatest interests of life. The Bravery dance of the Dahomans and the Hooloe of the Bilh tribe in the Vindhy Hills are illustrations. The latter seems to have been reduced to an amusement conducted by professionals who go from village to village,—the battle being engaged in by women with long poles on the one side, and men with short cudgels on the other. There is here an element of comedy, which also appears in the Fiji club-dance. This, although no doubt originally suggested by war, is enlivened by the presence of a clown covered with leaves and wearing a mask. The monotonous song accompanying the club-dance is by way of commentary or explanation. So, also, in Guatemala there is a public baille or dance, in which all the performers, wearing the skins and heads of beasts, go through a mock battle, which always ends in the victory of those wearing the deer’s head. At the end the victors trace in the sand with a pole the figure of some animal; and this exhibition is supposed to have some historical reference. But nearly all savage tribes have a regular war-dance, in which they appear in fighting costume, handle their weapons, and go through the movements of challenge, conflict, pursuit or defeat. The women generally supply the stimulus of music. There is one very picturesque dance of the Natal Kaffirs, which probably refers to the departure of the warriors for the battle. The women appeal plaintively to the men, who slowly withdraw, stamping on the ground and darting their short spears or assegais towards the sky.

In Madagascar, when the men are absent on war, the women dance for a great part of the day, believing that this inspires their husbands with courage. In this, however, there may be some religious significance. These war-dances are totally distinct from the institution of military drill, which belongs to a later period, when social life has become less impulsive and more reflective. There can be little doubt that some of the characteristic movements of these primitive hunting and war-dances survive in the smooth and ceremonial dances of the present day. But the early mimetic dance was not confined to these two subjects; it embraced the other great events of savage life—the drama of courtship and marriage, the funeral dance, the consecration of labour, the celebration of harvest or vintage; sometimes, too, purely fictitious scenes of dramatic interest, while other dances degenerated into games. For instance, in Yucatan one man danced in a cowering attitude round a circle, while another followed, hurling at him bohodos or canes, which were adroitly caught on a small stick. Again, in Tasmania, the dances of the women describe their “clamber for the opossum, diving for shell-fish, digging for roots, nursing children andcaring for their husbands.” The Tasmanian woman by gesture taunts a chiefain with cowardice, gives him an opportunity of coming forward and recounting his courageous deeds in dance. The funeral dance of the Todas (another Indian hill-tribe) consists in walking backwards and forwards, without variation, to a howling tune of “ha! hoo!” The meaning of this is obscure, but it can scarcely be solely an outburst of grief. In Dahomey the blacksmiths, carpenters, hunters, braves and bards, with their various tools and instruments, join in a dramatic dance. We may add here a form of dance which is almost precisely equivalent to the spoken incantation. It is used by the professional devil-dancer of the wild Veddas for the cure of diseases. An offering of eattbles is put on a tripod of sticks, and the dancer, decorated with green leaves, goes into a paroxysm of dancing, in the midst of which he receives the required information. This, however, rather belongs to the subject of religious dances.

It is impossible here to enumerate either the names or the forms of the sacred dances which formed so prominent a part of the worship of antiquity. A mystic philosophy found them a resemblance to the courses of the stars. The Pythagorean idea was expanded by Sir John Davies, in his epic poem Orphæa, published in 1606. They were probably adapted to many purposes,—to thanksgiving, praise, supplication and humiliation. It is only one striking illustration of this widespread practice, that there was at Rome a very ancient order of priests especially named Salii, who struck their shields and sang assementa as they danced. The practice reappeared in the early church, special provision being made for dancing in the choir. Scaliger, who astonished Charles V. by his dancing powers, says the bishops were called Prassules, because they led the dance on feast days. According to some of the fathers, the angels are always dancing, and the glorious company of the apostles is really a chorus of dancers. Dancing, however, fell into discred in the feast of the Agape. St Augustine says, “Melius est fodere quam saltare”; and the practice was generally prohibited for some time. No church or sect has raged so fiercely against the cardinal sin of dancing as the Albigenses of Languedoc and Provence, who agreed in calling it the devil’s procession. After the middle of the 13th century there were still a few forms of religious dancing in the cathedrals of Spain, Portugal and Roussillon—especially in the Mozarabic Mass of Toledo. An account of the numerous secular dances, public and private, of Greece and Rome will be found in the classical histories, and in J. Weaver’s Essay towards a History of Dancing, (London, 1712), which, however, must be revised by more recent authorities. The Pyrrhic (derived from the Memphitic) in all its local varieties,

1 The Greek σαηηαηηa represented the surprise by robbers of a warrior ploughing a field. The gymnopedic dances imitated the sterner sports of the palaestra.

2 The Greek Lenaea and Dionysia had a distinct reference to the seasons.
the Bacchanalia and the Hymenaeae were among the more important. The name of Lycurgus is also associated with the Triconch. Among the stage dances of the Athenians, which formed interludes to the regular drama, one of the oldest was the Delian dance of the Labyrinths, ascribed to Theseus, and called Τιπασωτ, from its resemblance to the flight of cranes, and one of the most powerful was the dance of the Eumenides. A further development of the art took place at Rome, under Augustus, when Pylades and Bathyllus brought serious and comic pantomime to great perfection. The subjects chosen were such as the labours of Hercules, and the surprise of Venus and Mars by Vulcan. The state of public feeling on the subject is well shown in Lucian's amusing dialogue De Saltatione. Before this Rome had only very inferior buffoons, who attended dinner parties, and whose art traditions belonged not to Greece, but to Etruria. Apparently, however, the Romans, though fond of ceremony and of the theatre, were by temperament not great dancers in private. Cicero says: "Nemo fere saltat sobrius, nisi forte insani." But the Italian dance of the imperial theatre, supported by music and splendid dresses, supplanted for a time the older dramas. It was the policy of Augustus to cultivate other than political interests for the people; and he passed laws for the protection and privilege of the pantomimists. They were freed from the jus virorum, and they used their freedom against the peace of the city. Tiberius and Domitian oppressed and banished them; Trajan and Aurelius gave them such titles as decurions and priests of Apollo; but the pantomime stage soon yielded to the general corruption of the empire.

Modern Dancing.—In modern civilized countries dancing has developed as an art and pastime, as an entertainment. Its direct application to arouse emotion or religious feeling tends to be obscured and finally dropped out.

Italy, in the 15th century, saw the renaissance of dancing, and France may be said to have been the nursery of the modern art, though comparatively few modern dances are really French in origin. The national dances of other countries were brought to France, studied systematically, and made perfect there. An English or a Bohemian dance, practised only amongst peasants, would be taken to France, polished and perfected, and would at last find its way back to its own country, no more recognizable than a piece of elegant cloth when it returns from the printer to the place from which as "grey" material it was sent. The fact that the terminology of dancing is almost entirely French is a sufficient indication of the origin of the rules that govern it. The earliest dances that bear any relation to the modern art are probably the danses basses and danses hautes of the 16th century. The danse basse was the dance of the court of Charles IX., and of good society, the steps being very grave and dignified, not to say solemn, and the accompaniment a psalm tune. The danses hautes or baladines had a skipping step, and were practised only by clowns and country people. More lively dances such as the Gaillarde and Valsa were introduced into France from Italy by Catherine de' Medici, but even in these the interest was chiefly spectacular. Other dances of the same period were the Branle (afterwards corrupted to Brauile, and known in England as the Brawle)—a kind of generic dance which was capable of an almost infinite amount of variety. Thus there were imitative dances—Branles mimés, such as the Branles des Ermites, Branles des flambeaux and the Branles des lavandières. The Branle in its original form had steps like the Allemande. Perhaps the most famous and stately dance of this period was the Pavane (of Spanish origin), which is very fully described in Tabouret's Orchésographie, the earliest work in which a dance is found minutely described. The Pavane, which was really more a procession than a dance, must have been a very gorgeous and noble sight, and it was perfectly suited to the dress of the period, the stiff brocades of the ladies and the swords and heavily-plumed hats of the gentlemen being displayed in its simple and dignified measures to great advantage. The dancers

1 The Pantominus was an outgrowth from the canticum or choral singing of the older comedies and Fabulae Attelance.
DANCE

Dance which were naturalized in France were the Écossaise popular in 1760; the Cotillon, fashionable under Charles X., derived from the French partner dance and danced by ladies in short skirts the Galop, imported from Germany; the Lancers, invented by Laborde in 1836; the Polka, brought by a dancing master from Prague in 1840; the Schottische, also Bohemian, first introduced in 1824; the Bourrée, or French clog-dance; the Quadrille, known in the 18th century as the Contre-danse; and the Waltz, which was danced as a volta by Henry III. of France, but only became popular in the beginning of the 19th century. We shall return to the history of some of these latter dances in discussing the dances at present in use.

If France has been the nursery and school of the art of dancing, Spain is its true home. There it is part of the national life, the inevitable expression of the gay, contented, irresponsible, sunburnt nature of the people. The form of Spanish dances has hardly changed; some of them are of great antiquity, and may be traced back with hardly a break to the performances in ancient Rome of the famous dancing-girls of Cadiz. The connexion is lost during the period of the Arab invasion, but the art was not neglected, and Jovellanos suggests that it took refuge in the Asturias. At any rate, dances of the 10th and 12th centuries have been preserved uncorrupted. The earliest dances known were the Taradion, the Gibidona, the Pét-de-gibao, and (later) the Madonna Oronca, the Leoncino and the Paparon. Under Philip IV. these last two dancing was in high popularity, and ballets were organized with extraordinary magnificence of decoration and costume. They supplanted the national dances, and the Zarabanda and Chacona were practically extinct in the 18th century. It is at this period that the famous modern Spanish dances, the Bolero, Seguidilla and the Fandango, first appeared. Of these the Fandango is the most important. It is danced by two people in 6-8 time, beginning slowly and tenderly, the rhythm marked by the click of the castanets, the snapping of the fingers and the stamping of feet, and the speed gradually increasing until a whirl of exaltation is reached. A feature of the Fandango and also of the Seguidilla is a sudden pause of the music towards the end of each measure, upon which the dancers stand rigid in the attitudes in which the stopping of the music found them, and only move again when the music is resumed. M. Vuillier, in his History of Dancing, gives the description of the Fandango:—

"Like an electric shock, the notes of the Fandango animate all hearts. Men and women, young and old, acknowledge the power of this air over the ears and soul of every Spaniard. The young men spring to their places, rattling castanets or imitating their sound by snapping their fingers. They are remarkable for the willowy languor and lightness of their movements, the voluptuousness of their attitudes—beating the exact time with tapping heels. Partners change and entreat and pursue each other by turns. Suddenly the music stops, and each dancer shows his skill by remaining absolutely motionless, bounding again into the full life of the Fandango as the orchestra strikes up. The sound of the guitar, the violin, the rapid tic-tac of heels (tacones), the crack of fingers and castanets, the supple swaying of the dancers, fill the spectator with ecstasy. The measure whirls along in a rapid triple time. Spangles glitter; the sharp clank of ivory and ebony castanets beats out the cadence of strange, thrilling, deepening notes—assonances unknown to music, but curiously characteristic, effective and intoxicating. Amidst the rustle of silks, smiles gleam over white teeth, dark eyes sparkle and droop and flash up again in flame. All is flutter and glitter, grace and animation—quivering, sonorous, passionate, seductive."

The Bolero is a comparatively modern dance, having been invented by Sebastian Cerezo, a celebrated dancer of the time of King Charles III. It is remarkable for the free use made in it of the arms, and is said to be derived from the ancient Zarabanda, a violent and licentious dance, which has entirely disappeared, and with which the later Sarabanda has practically nothing in common. The step of the Bolero is slow and gliding but well marked. It is danced by one or more couples. The Seguidilla is hardly less ancient than the Fandango, which it resembles. Every province in Spain has its own Seguídilla, and the dance is accompanied by coplas, or verses, which are sung to traditional melodies or to the tunes of local composers; indeed, the national music of Spain consists largely of these coplas. Baron Davillier, among several specimens of Seguídillas, gives this one:

"Mi corazon volando
Se fué á tu pecho;
La cortesía alas,
Juego encantado.
Por atrevido
Se quedará por siempre
En el método." 

M. Vuillier quotes a copla which he heard at Polenza, in the Balearic Islands. This verse is formed on the rhythm of the Malagueña:

"Una estrella se ha pardida
En el ciel y no parece;
En tu cara
Y en tu frente resplandece."

The Jota is the national dance of Aragon, a lively and splendid, but withal dignified and reticent, dance derived from the 16th-century Passacaille. It is still used as a religious dance. The Cachucha is a light and graceful dance in triple time. It is performed by a single dancer of either sex. The head and shoulders play an important part in the movements of this dance. Other provincial dances now in existence are the Jaleo de Jerez, a whirling measure performed by gipsies, the Palota, the Polo, the Gallegada, the Muxerica, the Hobas Verdes, the Zapateado, the Zorongo, the Vito, the Tirano and the Triplea Trapela. Most of these dances are named either after the places where they are danced or after the composers who have invented them for them. Many of them are but slight variations from the Fandango and Seguídilla.

The history of court dancing in Great Britain is practically the same as that of France, and need not occupy much of our attention here. But there are strictly national dances still in existence which are quite peculiar to the country, and may be traced back to the dances and games of the Saxons. The Egg dance and the Carole were both Saxon dances, the Carole being a Yule-tide festivity, of which the present-day Christmas carol is a remnant. The oldest dances which remain unchanged in England are the Morris dances, which were introduced in the time of Edward III. The name Morris or Moorish refers to the origin of these dances, which are said to have been brought back by John of Gaunt from his travels in Spain. The Morris dances are associated with May-day, and are danced round a maypole to a lively and capering step, some of the performers having bells fastened to their knees in the Moorish manner. They are dressed as characters of old English tradition, such as Robin Hood, Maid Marian, Friar Tuck, Little John and Tom the Piper. All the true court dances of Great Britain are of an active and lively measure; they may all, indeed, be said to be founded on the jig; and the hornpipe, which is a kind of jig, is the national dance of England. Captain Cook, on his voyages, made his sailors dance hornpipes in calm weather to keep them in good health. A characteristic of English dances was that they partook to a great extent of the nature of games; there was little variety in the steps, which were nearly all those of the jig or hornpipe, but these were incorporated into various games or plays, of which the Morris dances were the most elaborate. Richard Baxter wrote that "sometimes the Morris dancers would come into the church in all their linen and scarves and antic dresses, with Morris bells jingling at their legs; and as soon as Common Prayer was read, did haste and presently to their play again."

May-day has always been celebrated in England with rustic dances and festivities. Before the Reformation there were no

1 "My heart flew to thy breast. Thou didst cut its wings, so that it remained there. And now it has waxed daring, and will stay with thee for evermore."

2 "A star is lost and appears not in the sky; in thy face it has set itself; on thy brow it shines."
Dancing in present-day society is a comparatively simple affair, as five-sixths of almost all ball programmes consist of waltzes.

The origin of the waltz is a much-debated subject, the French, Italians and Bavarians each claiming for their respective countries the honour of having given birth to it. As a matter of fact the waltz, as it is now danced, comes from Germany; but it is equally true that its real origin is French, since it is a development of the Volte, which in its turn came from the Lavelota of Provence, one of the most ancient of French dances. The Lavelota was fashionable in the 17th century and was the delight of the Valois court. The Volte danced by Henry III. was really a Valse à deux pas; and Castil-Blaze says that "the waltz which we took again from the Germans in 1705 had been a French dance for four hundred years." The change, it is true, came upon it during its visit to Germany, hence the theory of its German origin.

The first German waltz tune is dated 1770 — "Aeh! du lieber Augustin." It was first danced at the Paris opera in 1793, in Gardel's ballet La Dansomanie. It was introduced to English ballrooms in 1812, when it roused a storm of ridicule and opposition, but it became popular when danced at Almack's by the empress of Russia in 1816. The Waltz a troisième était a long step in which the movements of the knees play an important part. The tempo is moderate, so as to allow three distinct movements on the three beats of each bar; and the waltz is written in 3-4 time and in eight-bar sentences. Walking up and down the room and occasionally breaking into the step of the dance is not true waltzing, and the habit of pushing one's partner backwards along the room is an entirely English one. But the dancer must be able to waltz equally well in all directions, pivoting and crossing the feet when necessary in the reverse turn. It need hardly be said that the feet should never leave the floor in the true waltz.

The Quadrille is of some antiquity, and a dance of this kind was first brought to England from Normandy by William the Conqueror, and was common all over Europe in the 16th and 17th centuries. The term quadrille means a kind of card game, and the dance is supposed to be in some way connected with the game. A species of quadrille appeared in a French ballet in 1745, and since that time the dance has gone by that name. Like many other dances, it came from Paris to Almack's in 1815, and in its modern form was danced in England for the first time by Lady Jersey, Lady Harriet Butler, Lady Susan Ryder and Miss Montgomery, with Count Aldegare, Mr Montgomerie, Mr Harley and Mr Montague. It immediately became popular. It then consisted of very elaborate steps, which in England have been simplified until the degenerate practice has become common of walking through the dance. The quadrille, properly danced, has many of the graces of the minuet. It is often said that the quadrille is the square dance of modern French origin. This is incorrect, and probably arises from a mistaken identification of the terms quadrille and square dance. "Dull Sir John" and "Faine I would" were square dances popular in England three hundred years ago.

An account of the country-dance, with the names of some of the old dance-tunes, has been given above. The word is not, as has been supposed, an adaptation of the French contre-danse, neither is the dance itself French in origin. According to the New English Dictionary, contre-danse is a corruption of "country-dance," possibly due to a peculiar feature of many of such dances, like Sir Roger de Coverley, where the partners are drawn up in lines opposite to each other. The earliest appearance of the French word is in its application to English dances, which are contrasted with the French; thus in the Memoirs of Grammont, Hamilton says: "On quita les danses françaises pour se mettre aux contre-dances." The English "country-dances" were introduced into France in the early part of the 18th century and became popular; later French modifications were brought back.
to England under the French form of the name, and this, no
doubt, caused the long-accepted but confused derivativeness.
The Lancers were invented by Laborde in Paris in 1836.
They were brought over to England in 1839, and were made
fashionable by Madame Sacrè at her classes in Hanover Square
Rooms. The first four ladies to dance the lancers in England
were Lady Georgina Lygon, Lady Jane Fielding, M'dlle. Oiga de
Lechner and Miss Berkeley.
The Polka, the chief of the Bohemian national dances, was
adopted by Society in 1835 at Prague. Josef Neruda had seen
a peasant girl dancing and singing the polka, and had noted
down the tune and the steps. From Prague it readily spread to
Vienna, and was introduced to Paris by Cellarius, a dancing-
master, who gave it at the Odéon in 1840. It took the public by
storm, and spread like an infection through England and America.
Everything was named after the polka, from public-houses to
articles of dress. Mr Punch exerted his wit on the subject,
and even The Times complained that its French corre-
spondence was interrupted, since the polka had taken the place
of politics in Paris. The true polka has three slightly jumping
steps, danced on the first three beats of a four-quaver bar, the
last beat of which is employed as a rest while the toe of the un-
emphasised foot is drawn up against the heel of the other.
The Galop is strictly speaking a Hungarian dance, which
became popular in Paris in 1839. But some kind of a dance
corresponding to the galop was always indulged in after Voltes
and Centre-danse, as a relief from their rigid and constrained
measures.
The Washington Post and several varieties of Barn-dance are
of American origin, and became fashionable towards the end of
the 19th century.
The Polka-Mazurka is extremely popular in Vienna and Bud-a-
pest, and is a favourite theme with Hungarian composers. The
six movements of this dance occupy two bars of 3-4 time, and consist
of a mazurka step joined to the polka. It is of Polish origin.
The Polonaise and Mazurka are both Polish dances, and are
still fashionable in Russia and Poland. Every State ball in
Russia is opened with the ceremonious Polonaise.
The Schottische, a kind of modified polka, was "created"
by Markowski, who was the proprietor of a famous dancing
academy. The Highland Fling is a fling. The
Fling and Reel are Celtic dances, and form the majority of dances
of Scotland and Denmark. They are complicated measures
of a studied and classical order, in which free use is made
of the arm and of cries and stampings. The Strathspey is a slow and
grandiose modification of the Reel.
Sir Roger de Coverley is the only one of the old English social
dances which has survived to the present day, and it is frequently
danced at the conclusion of the less formal sort of balls. It is a
merry and lively game in which all the company take part, men
and women facing each other in two long rows. The dancers
are constantly changing places in such a way that if the dance is
carried to its conclusion everyone will have danced with everyone
else. The music was first printed in 1685, and is sometimes
written in 2-4 time, sometimes in 6-8 time, and sometimes in
3-9 time.
The Cotillon is a modern development of the French dance of
the same name referred to above. It is an extremely elaborate
dance, in which a great many toys and accessories are employed;
hundreds of figures may be contrived for it, in which presents,
toys, lighted papers, biscuits, air-balloons and handkerchiefs
are used. Ballet, &c.—The modern ballet (q.v.) seems to have been first
produced on a considerable scale in 1489 at Tortona, before
Duke Galeazzo of Milan. It soon became a common amusement
on great occasions at the European courts. The ordinary length
was five acts, each containing several entrées, and each entrée
containing several quadrilles. The accessories of painting,
sculpture and movable scenery were employed, and the repre-
sentation often took place at night. The allegorical, moral
and ludicrous ballets were introduced to France by Baille in the time
of Catherine de' Medici. The complex nature of these exhibitions
may be gathered from the title of one played at Turin in 1634—
La verità nemia della apparenza, sollevata dal tempo. Of the
ludicrous, one of the best known was the Venetian ballet of I a
verità raramente. Now and then, however, a high political aim
may be discovered, as in the "Prosperity of the State of France,
Danced before Richelieu in 1641, or "Religione unita al
Great Britain to the rest of the World," danced at London on
the marriage of Princess Elizabeth to the Elector Frederick.
Outside the theatre, the Portuguese revived an ambulatory ballet
which was played on the canonization of Carlo Borromeo, and
for which they gave the name of the Tyrrhenic Pomp. During this
time also the ceremonial ball (with all its elaborate detail of
courante, minuet and saraband) was cultivated. The fathers
of the church assembled at Trent gave a ball in which they took a
part. Masked balls, too, resembling in some respects the Roman
Saturnalia, became common towards the end of the 17th century.
In France a ball was sometimes diversified by a masquerade,
carried on by a limited number of persons in character-costume.
Two of the most famous were named "au Sauvage" and "des
Sorcières." In 1715 the regent of France started a system of
public balls in the opera-house, which did not succeed.
Dancing, also, formed a leading element in the Opéra Français introduced by
Quinault. His subjects were chiefly marvellous, drawn from
romantic heroic mythology, and the choral dancing was not merely
divertissement, but was intended to assist and enrich the dramatic
action of the whole piece.

Musical Gymnastics.—Dancing is an important branch of
physical education. Long ago Locke pointed out (Education,
§§ 67, 196) that the effects of dancing are not confined to the
body; it gives to children, he says, not mere outward graceful-
ness of motion, but manly thoughts and a becoming confidence.
Only lately, however, has the advantage been recognized of
making gymnastics attractive by connecting it with what Homer
calls "the sweetest and most perfect of human enjoyments."
The practical principle against heavy weights and intense
monotonous exertion of particular muscles was thus stated by
Samuel Smiles (Physical Education, p. 148):—"The greatest
benefit is derived from that exercise which calls into action the
greatest number of muscles, and in which the action of these is
interrited at the shortest intervals." It required only one
further step to see how, if light and changing movements were
desirable, music would provide a powerful stimulus to gymnastics.
But the play also has its value. "A spontaneous flow of
energy for the mechanical effort of the Will. The force of
imitation or contagion, one of the most valuable forces in
education, is also much increased by the state of exhilaration
into which dancing puts the system. This idea was embodied by
Froebel in his Kindergarten plan, and was developed by Jahn
and Schreber in Germany, by Dio Lewis in the United States,
and by Ling (the author of the Swedish Cure Movement) in
Sweden.

Authorities.—For the old division of the Ars Gymnastica into
palaestrica and salutatoria, and of the latter into cubistica, sphaeristica
and poeticca, see the learned work of Heronimus Mercurialis, De
arte Gymnastica (Amsterdam, 1572). Cubistica was the art of throwing
souvenirs, and is described minutely by Tuccaro in his Trei
Dialogues (Paris, 1590). Sphaeristica included several complex games
at the same time,—the Greek apaleo, and the Roman trigonalis
et pagacina. Orchestic, divided by Plutarch in latre, is force
indicato, was really imaginative dancing, the "sweet poetry"
of Simonides. The importance of the choreomusica or hand-movement
is indicated by Ovid: "Si vox est, canta; si mollia brachia, salta." For
further information as to modern dancing, see Rameau's Le
maître à danser (1726); Querlon's Le triomphe des graces (1774);
Cauhacou, La danse ancienne et moderne (1754; Vuillier, History of
Dancing (Eng. trans., 1897); Giraudet, Traité de la danse (1906).

DANCOURT, FLORENT CARTON (1661-1725), French dramat-
ist and actor, was born at Fontainebleau on the 1st of November
1661. He belonged to a family of rank, and his parents entrusted
his education to Père de la Rue, a Jesuit, who made earnest
efforts to induce him to join the order. But he had no religious
vocation and proceeded to study law. He practised at the bar
for some time, but his marriage to the daughter of the comedian
François Lenoir de la Thorillière led him to become an actor,
and in 1685, in spite of the strong opposition of his family, he
appeared at the Théâtre Français. His gifts as a comedian gave him immediate and marked success, both with the public and with his fellow actors. He was the spokesman of his company on occasions of state, and in this capacity he frequently appeared before Louis XIV., who treated him with great favour. One of his most famous impersonations was Alceste in the *Misanthrope* of Molière. His first play, *Le Notaire obligeant*, produced in 1685, was well received. *La Désolation des jeunes* (1687) was still more successful. *Le Chevalier à la mode* (1687) is generally regarded as his best work, though his claim to original authorship in this and some other cases has been disputed. In *Le Chevalier à la mode* appears the bourgeoise infatuated with the desire to be an aristocrat. The type is developed in *Les Bourgeoisés à la mode* (1602) and *Les Bourgeoisés de qualité* (1700). Dancourt was a prolific author, and produced some sixty plays in all. Some years before his death he terminated his career both as an actor and as an author by retiring to his château at Courcelles le Roi, in Berry, where he employed himself in making a poetical translation of the Psalms and in writing a sacred tragedy. He died on the 7th of December 1725. The plays of Dancourt are faithful descriptions of the manners of the time, and as such have real historical value. The characters are drawn with a realistic touch that led to his being styled by Charles Palissot the Teniers of comedy. He is very successful in his delineation of low life, and especially of the peasantry. The dialogue is sparkling, witty and natural. Many of the incidents of his plots were derived from actual occurrences in the "fast" and scandalous life of the period, and several of his characters were drawn from well-known personages of the day. Most of the plays incline to the type of farce rather than of pure comedy. Voltaire defined his talent in the words: "Ce que Regnard était à l'égard de Molière dans la haute comédie, le comédien Dancourt l'était dans la farce."

His two daughters, Manon and Marie Anne (Mimi), both obtained success on the stage of the Théâtre Français.

The complete works of Dancourt were published in 1760 (12 vols. 12mo). An edition of his *Théâtre choisi*, with a preface by F. Sarcey, appeared in 1884.

**DANDELION** (*Taraxacum officinale*), a perennial herb belonging to the natural order Compositae. The plant has a wide range, being found in Europe, Central Asia, North America, and the Arctic regions, and also in the south temperate zone. The leaves form a spreading rosette on the very short stem; they are smooth, of a bright shining green, sessile, and tapering downwards. The name dandelion is derived from the French *denti-de-lion*, an appellation given on account of the tooth-like lobes of the leaves. The long tap-root has a simple or many-headed rhizome; it is black externally, and is very difficult of extirpation. The flower-stalks are smooth, brittle, leafless, hollow, and very numerous. The flowers bloom from April till August, and remain open from five or six in the morning to eight or nine at night. The flower-heads are 1½-2½ in. in width; the florets are all strap-shaped. The fruits are olive or dull yellow in colour, and are each surmounted by a long beak, on which rests a pappus of delicate white hairs, which occasions the ready dispersal of the fruit by the wind; each fruit contains one seed. The globes formed by the plumed fruits are nearly two inches in diameter. The involucres consists of an outer spreading (or reflexed) and an inner and erect row of bracts. In all parts of the plant a milky juice is contained, which has a somewhat complex composition. The chief constituent is taraxacin, a neutral principle. In addition the juice contains taraxacine (derived from the former), asparagin, inulin, resins and salts. An extract (dose 5-12 grains), a liquid extract (dose ½-1 drachm) and a succus (dose 1-2 drachms) of the root are all used medicinally. For the purposes formerly recognized taraxacum is now never used, but it has been shown to possess definite cholagogue properties, and may therefore be prescribed along with ammonium chloride in cases of hepatic constipation, which it very constantly relieves. The root—which is the medicinal product—is most bitter from March to July, but the milky juice it contains is less abundant in the summer than in the autumn.

For this reason, the extract and succus are usually prepared during the months of September and October. After a frost a change takes place in the root, which loses its bitterness to a large extent. In the dried state the root will not keep well, being quickly attacked by insects. Externally it is brown and wrinkled, internally white, with a yellow centre and concentric paler rings. It is two inches to a foot long, and about a quarter to half an inch in diameter. The leaves are bitter, but are sometimes eaten as a salad; they serve as food for silkworms when mulberry leaves are not to be had. The root is roasted as a substitute for coffee. Several varieties of the dandelion are recognized by botanists; they differ in the degree and mode of cutting of the leaf-margin and the erect or spreading character of the outer series of bracts. The variety *palustre*, which affects boggy situations, and flowers in late summer and autumn, has nearly entire leaves, and the outer bracts of its involucre are erect.

**DANDOLO**, the name of one of the most illustrious patrician families of Venice, of which the earliest recorded member was one of the electors of the first doge (a.d. 697). The Dandolo gave to Venice four doges; of these the first and most famous was Enrico Dandolo (c. 1120-1205), elected on the 1st of January 1193 (more Venice, 1192). He had distinguished himself in various military enterprises and diplomatic negotiations in the course of an active career, and although over seventy years old and of very weak sight (the story that he had been made blind by the emperor Manuel Comnenus while he was at Constantinople is a legend), he proved a most energetic and capable ruler. His first care was to re-establish Venetian authority over the Dalmatians, of which rebels expelled with the king of Hungary's protection, he failed to capture Zara, owing to the arrival of the Pisan fleet, and although the latter was defeated by the Venetians, the undertaking was suspended. In the meanwhile the situation in the East was becoming critical. The Eastern emperor Isaac II. Angelus had been deposed, imprisoned, and blinded by his
DANDOLO, V.

brother Alexius, who usurped the throne. The new emperor proved unfriendly to the Venetians and made difficulties about renewing their privileges. In the West a new crusade to the Holy Land was in preparation, and the crusaders sent ambassadors, one of whom was Villehardouin, the historian of the expedition, to ask the Venetians to give them passage and means of transport (1204). After much deliberation the republic agreed to transport 4500 horse and 29,000 foot to Palestine with provisions for one year, for a sum of 85,000 marks; in addition 50 Venetian galleys would be provided free of charge, while Venice was to receive half the conquests made by the crusaders. But as the time agreed upon for the departure approached, it appeared that the crusaders had not the money to pay the stipulated advance. Dandolo then proposed that if they helped him to reduce Zara payment might be deferred. Some of the crusaders disapproved of this attack on a Christian city, but the majority, though only a glad of an opportunity for plunder, willingly agreed. The expedition sailed on the 8th of October 1204, three hundred sail in all, with the aged Dandolo himself in command. Zara was taken and pillaged, for which the Venetians were severely reprimanded by the pope. But new possibilities of conquest were now opened up at the suggestion of Alexius, the son of the deposed emperor Isaac. He promised the crusaders that if they went first to Constantinople and re-instated Isaac, the Venetians were to receive 10,000 men and 200,000 marks for the expedition to Egypt, and subject the Eastern to the Western Church. The proposal was accepted, largely owing to the influence of Dandolo, who saw in it a means for further extending the dominions and commerce of the Venetians. After wintering at Zara the fleet set sail on the 7th of April 1205, and on the 23rd of June anchored in the Bosporus. After long parleys the city was attacked by land and sea on the 17th of July (the fleet being commanded by Dandolo) and taken by storm. The emperor Alexius fled, and Isaac reoccupied the throne, but, although grateful to the crusaders, he was not disposed to fulfil the promises made by his son. Tumults between crusaders and Greeks arose, and the people of the city, excited by a certain Alexius Murzuphlius, murmured at the new taxes which were imposed on them. A revolt broke out, and an officer named Nicholas Canabuz was placed on the throne; Prince Alexius was strangled by order of Murzuphlius, Isaac died of the shock, Murzuphlius imprisoned Canabuz and made himself emperor (Alexius V.). The crusaders thereupon attacked Constantinople a second time (18th of April 1204), and after a desperate struggle captured the city, which they subjected to hideous carnage. Immense booty was secured, the Venetians obtaining among other treasures the four bronze horses which adorn the façade of St Mark's. The Eastern empire was abolished, and a feudal Latin empire erected in its stead. The leaders of the crusaders then met to elect an emperor. Dandolo was one of the candidates, but Count Baldwin of Flanders was elected and crowned on the 23rd of May. The Venetians were given Crete and several other islands and ports in the Levant, which formed an uninterrupted chain from Venice to the Black Sea, a large part of Constantinople (whence the doge assumed the title of "lord of a quarter and a half of Romania"), and many valuable privileges. But hardly had the new state been established when various provinces rose in rebellion and the Bulgarians invaded Thrace. A Latin army was defeated by them at Adrianople (April 1205), and the emperor himself was captured and killed, the fragments of the force being saved only by Dandolo's prowess. But he was now old and ill, and on the 23rd of June 1205 he died. He certainly consolidated Venice's dominion in the East and increased its commercial prosperity to a very high degree. But the policy he pursued in turning the crusaders against Constantinople, in order to promote the interests of the republic, while serving to break up the Greek empire, created in its place a Latin state that was far too feeble to withstand the onslaught of Greek national feeling and Orthodox fanaticism; at the same time the Greeks were greatly weakened and their power of resisting the Turks consequently lessened. This paved the way for the Turkish invasion of Europe, which proved an unmixd calamity for all Christendom, Venice included.

Enrico Dandolo's sons distinguished themselves in the public service, and his grandson Giovanni was doge from 1280 to 1289. The latter's son Andrea commanded the Venetian fleet in the war against Genoa in 1294, and, having been defeated and taken prisoner, he was so overwhelmed with shame that he committed suicide by beating his head against the mast (according to Andrea Navagero). Francesco Dandolo, also known as Dandolo Can, was doge from 1329 to 1330. During his reign the Venetians went to war with Martino della Scala, lord of Verona, with the result that they occupied Treviso and otherwise extended their possessions on the terra firma. Andrea Dandolo (1307-10-1354), the last doge of the family, reigned from 1343 to 1354. He had been the first Venetian noble to take a degree at the university of Padua, where he had also been a professor of jurisprudence. The terrible plague of 1348, wars with Genoa, against whom the great naval victory of Lojera was won in 1353, many treaties, and the subjugation of the seventh revolt of Zara, are the chief events of his reign. The poet Petrarch, who was the doge's intimate friend, was sent to Venice on a peace mission by Giovanni Visconti, lord of Milan. "Just, incorruptible, full of zeal and of love for his country, and at the same time learned, of rare eloquence, wise, affable, and humane," is the poet's verdict (Varior. 1354). Dandolo died on the 7th of September 1354. He is chiefly famous as a historian, and his Annales to the year 1280 are one of the chief sources of Venetian history for that period; they have been published by Muratori (Rer. Ital. Script. tom. xxi.). He also had a new code of laws compiled (issued in 1346) in addition to the statute of Jacopo Tiepolo.

Another well-known member of this family was Silvestro Dandolo (1796-1866), son of Giolamo Dandolo, who was the last admiral of the Venetian republic and died an Austrian admiral in 1847. Silvestro was an Italian patriot and took part in the revolution of 1848.

BIBLIOGRAPHY.—S. Romanin, Storia documentata di Venezia (Venice, 1853); among more recent books H. Kretschmayer's excellent Geschichte von Venedig (Gotha, 1905) should be consulted: it contains a bibliography of the authorities and all the latest researches and discoveries; C. Cipolla and G. Monticolo have published many essays and editions of chronicles in the Archivio Veneto, and the Fonti per la Storia d'Italia," in the Istiuto storico italiano; H. Schwartzfeld has written a life of Andrea Dandolo in German (Munich, 1876). (L. V.*.)

DANDOLO, VINCENZO, COUNT (1758-1819), Italian chemist and agriculturist, was born at Venice, of good family, though not of the same house as the famous doges, and began his career as a physician. He was a prominent opponent of the oligarchical party in the revolution which took place on the approach of Napoleon, and he was one of the envos sent to seek the protection of the French. When the request was refused, and Venice was placed under Austria, he removed to Milan, where he was made member of the great council. In 1799, on the invasion of the Russians and the overthrow of the Cisalpine republic, Dandolo retired to Paris, where, in the same year, he published his treatise Les Hommes nouveaux, ou moyen d'opérer une régénération nouvelle. But he soon after returned to the neighbourhood of Milan, to devote himself to scientific agriculture. In 1805 Napoleon made him governor of Dalmatia, with the title of proviseur général, in which position Dandolo distinguished himself by his efforts to remove the wretchedness and idleness of the people, and to improve the country by draining the pestilential marshes and introducing better methods of agriculture. When, in 1809, Dalmatia was re-annexed to the Illyrian provinces, Dandolo returned to Venice, having received as his reward from the French emperor the title of count and several other distinctions. He died in his native city on the 13th of December 1819.

Dandolo published in Italian several treatises on agriculture, vine-cultivation, and the rearing of cattle and sheep; a work on which was translated into French by Fruzzelle; a work on the discoveries in chemistry which were made in the last
DANDY—DANELAGH 803

quarter of the 18th century (published 1796); and translations of several of the best French works on chemistry.

DANDY, a word of uncertain origin which about 1813-1816 became a London colloquialism for the exquisite or top of the period. It seems to have been in use on the Scottish border at the end of the 18th century, its full form, it is suggested, being "Jack-a-Dandy," which from 1659 had a sense much like its later one. It is probably ultimately derived from the French *dandiz*, "a ninny or booby," but a more direct derivation was suggested at the time of the rise of the Regency dandies. In The Northampton Mercury, under date of the 17th of April 1819, occurs the following: "Origin of the word 'dandy.' This term, which has been recently applied to a species of reptile very common in the metropolis, appears to have arisen from a small silver coin struck by King Henry VII., of little value, called a *dandiprat*; and hence Bishop Fleetwood observes the term is applied to worthless and contemptible persons."

It was Beau Brummel, the high-priest of fashion, who gave dandyzism its great vogue. But before his day foppery in dress had become something more than the personal eccentricity which it had been in the Stuart days and earlier. About the middle of the 18th century was founded the Macaroni Club. This was a band of young men of rank who had visited Italy and sought to introduce the southern elegances of manner and dress into England. The Macaronis gained their name from their introduction of the Italian dress to English tables, and were at their zenith about 1772, when their costume is described as "white silk breeches, very tight coat and vest with enormous white neckcloths, white silk stockings and diamond-buckled red-heeled shoes." For some time the moving spirit of the club was Charles James Fox. It was with the advent of Brummel, however, that the cult of dandyzism became a social force. Beau Brummel was supreme dictator in matters of dress, and the prince regent is said to have wept when he disapproved of the cut of the royal coat. Around the Beau collected a band of young men whose insolent and affected manners made them universally unpopular. Their chief glory was their clothes. They wore coats of blue or brown cloth with brass buttons, the coat-tails almost touching the heels. Their trousers were buckskin, so tight that it is said they "could only be taken off as an eel would be divested of his skin." A pair of highly-polished Hessian boots, a waistcoat buttoned incredibly tight so as to produce a small waist, and opening at the breast to exhibit the frilled shirt and cravat, completed the costume of the true dandy.

Upon the Beau's disgrace and ruin, Lord Alvanley was regarded as leader of the dandies and "first gentleman in England." Though in many ways a worthier man than Brummel, his vanity exposed him to much derision, and he fought a duel on Wimbledon Common with Morgan O'Connell, who, in the House of Commons, had called him a "bloated buffoon." After 1825 "dandy" lost its invidious meaning, and came to be applied generally to those who were neat in dress rather than to those guilty of effeminacy.

DANEGELD, an English national tax originally levied byÆthelred II. (the Unready) as a means of raising the tribute which was the price of the temporary cessation of the Danish ravages. This expedient of buying off the invader was first adopted in 991 on the advice of certain great men of the kingdom. It was repeated in 994, 1002, 1007 and 1012. With the accession of the Danish king Canute, the original *raison d'être* of the tax ceased to exist, but it continued to be levied, though for a different purpose, assuming now the character of an occasional war-tax. It was exceedingly burdensome, and its abolition by Edward the Confessor in 1051 was welcomed as a great relief. William the Conqueror received it immediately after his accession, as a customary method of national taxation, and it was with the object of facilitating its collection that he ordered the compilation of Domesday Book. It continued to be levied until 1163, in which year the name Danegeld appears for the last time in the Rolls. Its place was taken by other imposts of similar character but different name.

DANELAGH, the name given to those districts in the north and north-east of England which were settled by Danes and other Scandinavian invaders during the period of the Viking invasions. The real settlement of England by Danes began in the year 866 with the appearance of a large army in East Anglia, which turned north in the following year. The Danes captured York and overthrew the Northumbrian kingdom, setting up a puppet king of their own. They encamped in Nottingham in 868, and Northern Mercia was soon in their hands; in 870 Edmund, king of the East Anglians, fell before them. During the next few years they maintained their hold on Mercia, and we have at this time coins minted in London with the inscription "Alfdene rex," the name of the Danish leader. In the winter of 874-875 they advanced as far north as the Tyne, and at the same time Cambridge was occupied. In the meantime the great struggle with Alfred the Great was being carried on. This was terminated by the peace of Wedmore in 878, when the Danes withdrew from Wessex and settled finally in East Anglia under their king Guthrum. This peace was finally and definitely ratified in the document known as the peace of Alfred and Guthrum, which is probably to be referred to the year 880. The peace determined the boundary of Guthrum's East Anglian kingdom. According to the terms of the agreement the boundary was to run along the Thames estuary to the mouth of the Lea (a few miles east of London), then up the Lea to its source near Leighton Buzzard, then due north to Bedford, then eastwards up the Ouse to Watling Street somewhere near Fenny or Stony Stratford. From this point the boundary is left undefined, perhaps because the kingdoms of Alfred and Guthrum ceased to be conterminous here, though if Northamptonshire was included in the kingdom of Guthrum, as seems likely, the boundary must be carried a few miles along Watling Street. Thus Northern Mercia, East Anglia, the greater part of Essex and Northumbria were handed over to the Danes and henceforth constitute the district known as the Danelagh.

The three chief divisions of the Danelagh were (i) the kingdom of Northumbria, (ii) the kingdom of East Anglia, (3) the district of the Five (Danish) Boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford and Lincoln, and forming a loose confederacy. Of the history of the two Danish kingdoms we know very little. Guthrum of East Anglia died in 890, and later we hear of a king Eric or Eohréc who died in 902. Another Guthrum was ruling there in the days of Edward the Elder. The history of the Northumbrian kingdom is yet more obscure. After an interregnum consequent on the death of Healdene the kingdom passed in 883 to one Guthred, son of Hardicanute, who ruled till 894, when his realm was taken over by King Alfred, though probably only under a very loose sovereignty. It may be noted here that Northumbria north of the Tyne, the old Bernicia, seems never to have passed under Danish authority and rule, but have remained in independence until the general submission to Edward in 924.

More is known of the history of the five boroughs. From 907 onwards Edward the Elder, working together withÆthelred of Mercia and his wife, worked for the recovery of the Danelagh. In that year Chester was fortified. In 911-912 an advance on Essex and Hertfordshire was begun. In 914 Buckingham was fortified and the Danes of Bedfordshire submitted. In 917 Derby was the first of the five boroughs to fall, followed by Leicester a few months later. In the same year a keen struggle all the Danes belonging to the "borough" of Northampton, as far north as the Welland (i.e., the border of modern Northamptonshire), submitted to Edward and at the same time Colchester was fortified; a large portion of Essex submitted and the whole of the East Anglian Danes came in. Stamford was the next to yield, soon followed by Nottingham, and in 920 there was a general submission on the part of the Danes and the reconquest of the Danelagh was now complete.

Though the independent occupation of the Danelagh by Viking invaders did not last for more than fifty years at the
outside, the Danes left lasting marks of their presence in these territories.

The divisions of the land are foreign not native. The grouping of shires round a county town as distinct from the old national shires is probably of Scandinavian origin, and so certainly is the division of Yorkshire and Lincolnshire into “ridings.” In Derbyshire, Leicestershire, Lincolnshire, part of Northamptonshire, Nottinghamshire, Rutlandshire (of later formation) and Yorkshire we have the counties divided into “wapentakes” instead of “hundreds,” again a mark of Danish influence.

When we turn to the social divisions we find in Domesday and other documents classes of society in these districts bearing purely Norse names, dreng, karl, karlman, bonde, thral, lysing, hold; in the system of taxation we have an assessment by carucates and not by hides and virgate, and the duodecimal rather than the decimal system of reckoning.

The highly developed Scandinavian legal system has also left abundant traces in this district. We may mention specially the institution of the lawmen,” whom we find as a judicial body in several of the towns in or near the Danelagh. They are found at Cambridge, Stamford, Lincoln, York and Chester. There can be no doubt that these lawmen, who can be shown to form a close parallel to and indeed the ultimate source of our jury, were of Scandinavian origin. Many other legal terms can be definitely traced to Scandinavian sources, and they are first found in use in the district of the Danelagh.

The whole of the place nomenclature of Yorkshire, Lincolnshire, Nottinghamshire and Northern Northamptonshire is Scandinavian rather than native English, and in the remaining districts of the Danelagh a goodly proportion of Danish place-names may be found. Their influence is also evident in the dialects spoken in these districts to the present day. It is probable that until the end of the 10th century Scandinavian dialects were almost the sole language spoken in the district of the Danelagh, and when English triumphed, after an intermediate bilingual state, large numbers of words were adopted from the early Scandinavian speech.

DANGERSFIELD, THOMAS (c. 1630–1683). English conspirator, was born about 1650 at Waltham, Essex, the son of a farmer. He began his career by robbing his father, and, after a rambling life, took to coinage false money, for which offence and others he was many times imprisoned. False to everyone, he first tried to involve the duke of Monmouth and others by concocting information about a Presbyterian plot against the throne, and this having proved a lie, he pretended to have discovered a Catholic plot against Charles II. This was known as the “Meal-tub Plot,” from the place where the incriminating documents were hidden at his suggestion, and found by the king’s officers by his information. Mrs Elizabeth Cellier, in whose house the tub was,—almoister to the countess of Powis, who had befriended Dangerfield when he posed as a Catholic, was, with her patroness, actually tried for high treason and acquitted (1680). Dangerfield, when examined at the bar of the House of Commons, made other charges against prominent Papists, and attempted to defend his character by publishing, among other pamphlets, Defenses of the two Vols. In his trial for libel, and on 20th of June 1685 he received sentence to stand in the pillory on two consecutive days, he was shipped from Aldgate to Newgate, and two days later from Newgate to Tyburn. On his way back he was struck in the eye with a cane by a barrister, Robert Francis, and died shortly afterwards from the blow. The barrister was, tried and executed for the murder.

DANIEL, the name given to the central figure 1 of the biblical Book of Daniel (see below), which is now generally regarded as a production dating from the time of Antiochus Epiphanes (175–164 B.C.). There are no means of ascertaining anything definite concerning the origin of the hero Daniel. The account of him in Dan. i. has been generally misunderstood. According to i. 3, the Babylonian chief was high enough to bring “certain of the children of Israel, and of the king’s seed, and of the nobles” to serve in the court. Many commentators have considered this to mean that some of the children were of the royal Judean line of Jewish noble families, an interpretation which is not justified by the wording of the passage, which contains nothing to indicate that the author meant to convey the idea that Daniel was either royal or noble. Josephus, 2 never doubting the historicity of Daniel, made the prophet a relative of Zedekiah and consequently of Jehoiakim, a conclusion which he apparently drew from the same passage, i. 3. Pseudo-Epiphanius, 3 again, probably having the same source in mind, thought that Daniel was a Jewish noble. The true Epiphanius 4 even gives the name of his father as Sabaan, and states that the prophet was born at Upper Beth-Horon, a village near Jerusalem. The after life and death of the seer are as obscure as his origin. The biblical account throws no light on the subject. According to the rabbis, 5 Daniel went back to Jerusalem with the return of the captivity, and is supposed to have been one of the founders of the mythical Great Synagogue. Others, traditions affirm that he died and was buried in Babylonia in the royal vault, while the Jewish traveller Benjamin of Tudela (10th cent.) was shown his tomb in Bnei-zeva, which is also mentioned by the Arab, Abuflaragius (Ezra ibn-Menas). The author of Daniel did not pretend to give any sketch of the prophet’s career, but was content merely with making him the central figure, around which to group more or less disconnected narratives and accounts of visions. In view of these facts, and also of the generally inaccurate character of all the historical statements in the work, there is really no evidence to prove even the existence of the Daniel described in the book bearing his name.

The question at once arises as to where the Maccabean author of Daniel could have got the name and personality of his Daniel. It is not probable that he could have invented both name and character. There is an allusion in the prophet Ezekiel (xiv. 14, 20, xxviii. 3) to a Daniel whom he places as a great personality between Noah and Job. But this could not be our Daniel, whom Ezekiel, probably a man of ripe age at the time of the Babylonian deportation of the Jews, would hardly have mentioned in the same breath with two such characters, much less have put him between them, because, had the Daniel of the biblical book existed at this time, he would have been a mere boy, lacking any such distinction as to make him worthy of Ezekiel’s words. It is evident that Ezekiel considered his Daniel to be a celebrated ancient prophet, concerning whose date and origin, however, there is not a single trace to guide research. Hitzig’s 6 conjecture that the Daniel of Ezekiel was Melchizedek is quite without foundation. The most that can be said in this connexion is that there may really have been a spiritual leader of the captive Jews who resided at Babylon and who was either named Daniel, perhaps after the unknown patriarch mentioned by Ezekiel, or to whom the same name had been given in the course of tradition by some historical confusion of persons. Following this hypothesis, it must be assumed that the fame of this Judaico-Babylonian leader had been handed down through the unclear medium of oral tradition until the time of Antiochus Epiphanes, when some gifted Jewish author, feeling the need of producing a work which should console his people in their affliction under the persecutions of that monarch, seized upon the personality of the seer who lived during a time of persecution bearing many points of resemblance to that of Antiochus IV., and moulded some of the legends than extent about the life and activity of this misty prophet into such a form as should be best suited to a didactic purpose.

1 Ant. x. 10, 1. 2 Chap. x. on the Prophets. 3 Panarion, adv. Haeres., 55, 3. 4 Prince, Dan. p. 26, n. 6. 5 Dan. p. viii. 6 The account in chap. ii. of the promotion of Daniel to be governor of Babylon, as a reward for his correct interpretation of Nebuchadnezzar’s dream, is very probably an imitation of the story of Joseph in Gen. xi.-xii. The points of resemblance are very striking. In both accounts, we have a young Hebrew raised by the favour of a heathen...
Daniel, Book of.—The Book of Daniel stands between Ezra and Esther in the third great division of the Hebrew Bible known as the Hagiographa, in which are classed all works which were not regarded as being part of the Law or the Prophets. The book presents the unusual peculiarity of being written in two languages, i.–ii. and vii.–xii. being in Hebrew, while the text of ii. iv.–vii. is the Palestinian dialect of Aramaic. The subject matter, however, falls naturally into two divisions which are not co-terminous with the linguistic sections; viz. i.–vi. and vii.–xii. The first of these sense-divisions deals only with narratives regarding the reign of Nebuchadrezzar and his reputed son Belshazzar, while the second section consists exclusively of apocalyptic prophecies. There can be no doubt that a definite plan was followed in the arrangement of the work. The author's object was clearly to demonstrate to his readers the necessity of faith in Israel's God, who shall not for ever allow his chosen ones to be brought under the heel of a ruthless heathen oppressor. To illustrate this, he makes use on the one hand (i.–vi.) of carefully chosen narratives, somewhat loosely connected it is true, but yet treating substantially the same subject, the physical triumph of God's servant over his unbelieving enemies; and on the other hand (vii.–xii.), he introduces certain prophetic visions illustrative of God's favour towards the same servant, Daniel. So carefully is this record of the visions arranged that the first two chapters of the second part of the book (vii.–viii.) were no doubt purposely made to appear in a symbolic form, in order that in the last two revelations (xi.–xii.), which were couched in such direct language as to be intelligible even to the modern student of history, the author might obtain the effect of a climax. The book is probably not therefore a number of parts of different origin thrown loosely together by a careless editor, who does not deserve the title of author. The or less disconnected sections of the first part of the work were probably so arranged purposely, in order to facilitate its diffusion at a time when books were known to the people at large chiefly by being read aloud in public.

Various attempts have been made to explain the sudden change from Hebrew to Aramaic in ii. 4. It was long thought, for example, that Aramaic was the vernacular of Babylonia and was consequently employed as the language of the parts relating to that country. But this was not the case, because the Babylonian language survived until a later date than that of the events portrayed in Daniel. Nor is it possible to follow the theory of Merx, that Aramaic, which was the popular tongue of the day when the Book of Daniel was written, was therefore used for the simpler narrative style, while the more learned Hebrew made the idiom of the philosophical portions. The first chapter, which is just as much in the narrative style as are the following Aramaic sections, is in Hebrew, while the distinctly apocalyptic chapter vii. is in Aramaic. A third view, that the bilingual character of the work points to a time when both languages were used indifferently, is equally unsatisfactory, because it is highly questionable whether two idioms can ever be used quite indifferently. In fact, a hybrid work in two languages would be a literary anachronism. In view of the apparent unity of the entire work, the only possible explanation seems to be that the book was written at first all in Hebrew, but subsequently at the instance of the general reader whose vernacular was Aramaic, a translation, possibly from the same pen as the original, was made into king to great political prominence, owing to his extraordinary God-given ability to interpret dreams. In both versions, the heathen astrologers make the first attempt to solve the difficulty, which results in failure, whereupon the pious Israelite, being summoned to the royal palace in be's case through the friendly interest of a court official, triumphantly explains the mystery to the king's satisfaction (cf. Prince, Dan. p. 29).

6 Aramaic. It must be supposed then that, certain parts of the original Hebrew manuscript being lost, the missing places were supplied from the current Aramaic translation.
7 It cannot be denied in the light of modern historical research that if the Book of Daniel be regarded as pretending to full historical authority, the biblical record is open to all manner of attack. It is now the general opinion of most modern scholars who study the Old Testament from a critical point of view that this work cannot possibly have originated, according to the traditional theory, at any time during the Babylonian monarchy, when the events recorded are supposed to have taken place.
8 The investigations of Haug, Spiegel and Windischmann show that this was a real Zoroastrian doctrine.
9 See Bevan, Dan. 27 ff.; Prince, Dan. 13.
10 For this whole discussion, see Prince, Dan. 15 ff.
11 The position of the book among the Hagiographa, instead of among the Prophetical works, seems to show that it was introduced after the closing of the Prophetical Canon. Some commentators have believed that Daniel was not an actual prophet in the proper sense, but only a seer, or else that he had no official standing as a prophet and that therefore the book was not entitled to a place among official prophetic books. But if the work had really been in existence at the time of the completion of the second part of the canon, the collectors of the prophetic writings, who in their care did not neglect even the parable of Jonah, would hardly have ignored the record of so great a prophet as Daniel is represented to have been.
12 Jesus ben Sirach (Ecclesiasticus), who wrote about 200–180 B.C., in his otherwise complete list of Israel's leading spirits (xlix.), makes no mention of Daniel. Hengstenberg's plea that Ezra and Mordecai were also left unmentioned has little force, because Ezra appears in the book bearing his name as nothing more than a prominent priest and scholar, while Daniel is represented as a great prophet.
13 Had the Book of Daniel been extant and generally known after the time of Cyrus (537–529 B.C.), it would be natural to look for some traces of its power among the writings of Haggai, Zechariah and Malachi, whose works, however, show no evidence that either the name or the history of Daniel was known to these authors. Furthermore, the manner in which the prophets are looked upon in ix. 6–10 cannot fail to suggest an extremely late origin for the book. Besides this, a careful study of ix. 2 seems to indicate that the Prophetic Canon was definitely completed at the time when the author of Daniel wrote. It is also highly probable that much of the material in the second part of the book was suggested by the works of the later prophets, especially by Ezekiel and Zechariah.
14 Some of the beliefs set forth in the second part of the book also practically preclude the possibility of the author having lived at the courts of Nebuchadrezzar and his successors. Most noticeable among these doctrines is the complete system of angelology consistently followed out in the Book of Daniel, according to which the management of human affairs is entrusted to a regular hierarchy of commanding angels, two of whom, Gabriel and Michael, are even mentioned by name. Such an idea was distinctly foreign to the primitive Israelite conception of the indivisibility of Yahweh's power, and must consequently have been a borrowed one. It would seem that Daniel, a native from the Babylonians, however, whose system of attendant spirits was far from being so complete as that which is set forth in the Book of Daniel, but rather from Persian sources where a more complicated angelology had been developed. As many commentators have brought out, there can be little doubt that the doctrine of angels in Daniel is an indication of prolonged Persian influence. Furthermore, it is now generally admitted that the doctrine of the resurrection of the dead, which is advanced for the first time in the Old Testament in Daniel, also originated among the Persians, and could only have been engrafted on the Jewish mind after a long period of intercourse with the Zoroastrian religion, which came into contact with the Jewish thinkers considerably after the time of Nebuchadrezzar.
5. All the above evidences are merely internal, but we are now able to draw upon the Babylonian historical sources to prove that Daniel could not have originated at the time of Nebuchadrezzar. There can be no doubt that the author of Daniel thought that Belshazzar (q.v.), who has now been identified beyond all question with Bel-šar-uzur, the son of Nabonidus, the last Semitic king of Babylon, was the son of Nebuchadrezzar, and that Belshazzar attained the rank of king. This prince did not even come from the family of Nebuchadrezzar. Nabonidus, the father of Belshazzar, was the son of a nobleman Nabu-baladus-ibqi, who was in all probability not related to any of the preceding kings of Babylon. Had Nabonidus been descended from Nebuchadrezzar he could hardly have failed in his records, which we possess, to have boasted of such a connexion with the greatest Babylonian monarch; yet in none of his inscriptions does he trace his descent beyond his father. Certain expositors have tried to obviate the difficulty, first by supposing that the expression “son of Nebuchadrezzar” in Daniel means “descendent” or “son,” a view which is rendered untenable by the facts just cited. This school has also endeavoured to prove that the author of Daniel did not mean to imply Belshazzar’s kingship of Babylon at all by his use of the word “king,” but they suggest that the writer of Daniel believed Belshazzar to have been co-regent. If Belshazzar had held such a position, which is extremely unlikely in the absence of any evidence from the cuneiform documents, he would hardly have given the unqualified title “king of Babylon” as occurs in Daniel. For example, Cambyses, son of Cyrus, was undoubtedly co-regent and bore the title “king of Babylon” during his father’s lifetime, but, in a contract which dates from the first year of Cambyses, it is expressly stated that Cyrus was still “king of the lands.” This should be contrasted with Dan. viii. 1, where reference is made to the “third year of Belshazzar, king of Babylon” without any allusion to another over-ruler. Such attempts are at best subterfuges to support an impossible theory regarding the origin of the Book of Daniel, whose author clearly believed in the kingship of Belshazzar and in that prince’s descent from Nebuchadrezzar.

Furthermore, the writer of Daniel asserts (v. 1) that a monarch “Darius the Mede” received the kingdom of Babylon after the fall of the native Babylonian house, although it is evident, from i. 21, x. 1, that the biblical author was perfectly aware of the existence of Cyrus. The fact that in no other scriptural passage is mention made of a Mede as king of Babylon and Cyrus, and the absolute silence of the authoritative ancient authors regarding such a king, make it apparent that the late author of Daniel is again in error in this particular. It is known that Cyrus became master of Media by conquering Assyagyes, and that the troops of the king of Persia capturing Babylon took Nabonidus prisoner with but little difficulty. Unsuccessful attempts have been made to identify this mythical Darius with the Cyaxares, son of Assyagyes, of Xenophon’s Cyropaedia, and also with the Darius of Eusebius, who was in all probability Darius Hystaspis. There is not only no room in history for this Median king of the Book of Daniel, but it is also highly likely that the interpolation of “Darius the Mede” was caused by a confusion of history, due both to the destruction of the Assyrian capital Nineveh by the Medes, sixty-eight years before the capture of Babylon by Cyrus, and also to the fame of the later king, Darius Hystaspis, a view which was advanced as early in the history of biblical criticism as the days of the Bezdictine monk, Marianus Scotus. It is important to note in this connexion that Darius the Mede is represented as the son of Xerxes (Ahura (or Artayrus) and it is stated in Dan. vii. 10 that he was the son of Xerxes. Darius Hystaspis was the father of Xerxes, according to Herodotus (iii. 80) established twenty satrapies. Darius the Mede entered into possession of Babylon after the death of Belshazzar; Darius Hystaspis conquered Babylon.

from the hands of certain rebels (Her. iii. 153-160). In fine, the interpolation of a Median Darius must be regarded as the most glaring historical inaccuracy of the author of Daniel. In fact, this error of the author alone is proof positive that he must have lived at a very late period, when the record of most of the earlier historical events had become hopelessly confused and inverted.

With these chief reasons why the Book of Daniel cannot have originated in the Babylonian period, if the reader will turn more especially to the apocalyptic sections (vii.—xii.), it will be quite evident that the author is here giving a detailed account of historical events which may easily be recognized through the thin veil of prophetic mystery thrown lightly around them. It is indeed highly suggestive that just those occurrences which are the most remote from the assumed standpoint of the writer are the most correctly stated, while the nearer we approach the author’s supposed time, the more inaccurate does he become. It is quite apparent that the predictions in the Book of Daniel centre on the period of Antiochus Epiphanes (175-164 B.C.), when that Syrian prince was endeavouring to suppress the worship of Yahweh and substitute for it the Greek religion. There can be no doubt, for example, that in the “Little Horn” of vili. 8, viii. 9, and the “wicked prince” described in ix.—x., who is to work such evil among the saints, we have clearly and the predictions in this last section, x.—x., relating to future events, become inaccurate as soon as the author’s time approaches the reign of Antiochus Epiphanes. The general style of all these prophecies differs materially from that of all other prophetic writings in the Old Testament. Other prophets confine themselves to vague and general predictions, but the author of Daniel is strikingly particular as to detail in everything relating to the period in which he lived, i.e. the reign of Antiochus IV. Had the work been composed during the Babylonian era, it would have been more natural to expect prophecies of the Babylonian rulers, viz. Jerusalem’s, Ezekiel and Isaiah, rather than the acclamation of an ideal Messianic kingdom such as is emphasized in the second part of Daniel.

As a specimen of the apocalyptic method followed in Daniel, the celebrated prophecy of the seventy weeks (ix. 24-27) may be cited, a full discussion of which will be found in Prince, Daniel 157-161. According to Jer. xxv. 11-12, the period of Israel’s probation and trial was to last seventy years. In the angelic explanation in Daniel of Jeremiah’s prophecy, these years were in reality year-weeks, which indicated a period of 490 years. This is the true apocalyptic system. The author takes a genuine prophecy, undoubtedly intended by Jeremiah to refer simply to the duration of the Babylonian captivity, and, by means of a purely arbitrary and mystical interpretation, makes it denote the entire period of Israel’s degradation down to his own time. This prophecy is really nothing more than an extension of the vision of the 2300 evening-readings of vii. 14, and of the “time, times and a half a time” of vii. 23. The real problem is as to the beginning and end of this epoch, which is divided into three periods of unequal length: viz. one of seven weeks; one of sixty-two weeks; and the last 69 weeks. It seems probable that the author of Daniel, like the Chronicler, began his period with the fall of Jerusalem in 586. His first seven weeks, therefore, ending with the rule of “Messiah the Prince,” probably Joshua ben Josadak, the first high-priest after the exile (Ezra iii. 2), seem to coincide exactly with the duration of the Babylon exile, i.e. forty-nine years.

1 Prince, Dan. 35-42.
2 Certain tablets published by Strasser, bearing date continuously from Nabonidus to Cyrus, show that neither Belshazzar nor “Darius the Mede” could have had the title “king of Babylon.” See Driver, Introduction, xxii. Prince, Dan. 4.4-56.

4 Prince, Dan. 19-20, 140, 155, 179 ff.
5 That “Messiah” or “Anointed One” was used of the High-Priest is seen from Lev. x. 3, v. 16.
The second period of the epoch, during which Jerusalem is to be peopled and built, and at the end of which the Messiah is to be cut off, is much more difficult to determine. The key to the problem lies undoubtedly in the last statement regarding the overthrow of the Messiah or Anointed One. Such a reference coming from a Maccabean author can only allude to the deposition by Antiochus IV. of the high-priest Onias III., which took place about 174 B.C., and the Syrian king's subsequent murder of the same person not later than 171 (2 Macc. iv. 33-36). The difficulty now arises that between 537 and 171 there are only 366 years instead of the required number 434. It was evidently not the author's intention to begin the second period of sixty weeks simultaneously with the first period, as some expositors have thought, because the whole passage shows conclusively that he meant seventy independent weeks. Besides, nothing is gained by such a device, which would bring the year of the end of the second period down to the meaningless date 152, too late to refer to Onias. Cornill therefore adopted the only tenable theory regarding the problem; viz. that the author of Daniel did not know the chronology between 537 and 312, the establishment of the Seleucid era, and consequently made the period too long. A parallel case is the much quoted example of Demetrius, who placed the fall of Samaria (722 B.C.) 573 years before the succession of Ptolemies IV. (222), thus making an error of seventy-three years. Josephus, who places the reign of Cyrus forty to fifty years too early, makes a similar error.

The last week is divided into two sections (26-27), in the first of which the city and sanctuary shall be destroyed and in the second the daily offering is to be suspended. All critical scholars recognize the identity of this second half-week with the "time, times, and a half time" of v. 25. This last week must, therefore, end with the restoration of the temple worship in 164 B.C.

This whole prophecy, which is perhaps the most interesting in the Book of Daniel, presents problems which can never be thoroughly solved. The first is the author's own ignorance of both history and chronology, and secondly, because, in his effort to be as mystical as possible, he purposely made use of indefinite and vague expressions which render the criticism of the passage a most unsatisfactory task.

The Book of Daniel loses none of its beauty and force because we are bound, in the light of modern criticism, to consider it as a production of the reign of Antiochus Epiphanes, nor should conservative Bible-readers lament because the historical accuracy of the work is thus destroyed. The influence of the work was very great on the subsequent development of Christianity, but it was not the influence of the history contained in it which made itself felt, but rather of that sublime hope for a future deliverance of which the author of Daniel never lost sight. The allusion to the book by Jesus (Matt. xxiv. 15) shows merely that our Lord was referring to the work by its commonly accepted title, and implies no authoritative utterance with regard to its date or authorship. Our Lord simply made use of an apt quotation in a well-known work in order to illustrate and give additional force to his own prediction. If the book be properly understood, it must not only be admitted that the author made no pretense at accuracy of detail, but also that his prophecies were clearly intended to be merely an historical résumé, clothed for the sake of greater literary vividness in a prophetic garb. The work, which is certainly not a forgery, but only a consolatory political pamphlet, is just as powerful, viewed according to the author's evident intention, as a consolation to God's people in their dire distress at the time of Antiochus Epiphanes, as if it were, what an ancient but mistaken tradition had made it, really an accurate account of events which took place at the close of the Babylonian period.

**ADDITIONS TO DANIEL.**—The "additions to Daniel" are three in number: Susannah and the Elders, Bel and the Dragon, and The Song of the Three Children. Of these the two former have no organic connexion with the text. The case is otherwise with regard to the last. In some respects it helps to fill up a gap in the canonical text between verses 23 and 24 of chapter iii. And yet we find Polychronius, early in the 5th century, stating that this song was not found in the Syriac version.

**Susannah.**—This addition was placed by Theodotion before chap. i., and Bel and the Dragon at its close, whereas by the Septuagint and the Vulgate it was reckoned as chap. xiii. after the twelve canonical chapters, Bel and the Dragon as xiv. Theodotion's version is the source of the Peshitto and the Vulgate, for all three additions, and the Septuagint is the source of the Syro-Hexaplaric which has been published by Ceriani (Mont. Sacr. vii.). The legend recounts how that in the early days of the Captivity Susannah, the beautiful and pious wife of the rich Jachin, was walking in her garden and was there seen by two elders who were also judges. Inflamed with lust, they made infamous proposals to her, and when repulsed they brought against her a false charge of adultery. When brought before the tribunal she was condemned to death and was on the way to execution, when Daniel interposed and, by cross-examining the accusers apart, convinced the people of the falsity of the charge.

The source of the story may, according to Ewald (Gesch. 3 iv. 636), have been suggested by the Babylonian legend of the seduction of two old men by the goddess of love (see also Koran, Sur. ii. 96). Another and much more probable origin of the work is that given by Brüll (Das apoc. Susanna-Buch, 1877) and Ball (Speaker's Apocr. ii. 323-331). The first half of the story is based on a tradition—originating possibly in Jer. xxix. 21-32 and found in the Talmud and Midrash—of two elders Ahab and Zedekiah, who in the Captivity led certain women astray under the delusion that they should thereby become the mother of the Messiah. The second half of the story is, however, in the New Testament concerned with the latter half of the story, which deals with the trial. The characteristics of this section point to its composition about 100-90 B.C., when Simon ben Shetah was president of the Sanhedrin. Its object was to support the attempts of the Pharisees to bring about a reform in the administration of the law courts. According to Sadducean principles the man who was convicted of falsely accusing another of a capital offence was not put to death unless his victim was already executed. The Pharisees held that the intention of the accusers was equivalent to murder. Our apocryph upholds the Pharisaic contention. As Simon ben Shetah insisted on a rigorous examination of the witnesses, so does our writer: as he and his party required that the perjurer should suffer the same penalty he sought to inflict on another; so our writer represents the death penalty as inflicted on the perjured elders.

The language was in all probability Semitic-Hebrew or Aramaic. The paronomasiae in the Greek in verses 54-55 (ἐν τοῖς αἰγίλοις... αἰγίλοις) and 58-59 (ἐν τῶν ἀθανάτοις... ἀθανάτοις) present no cogent difficulty against this view; for they may be accidental and have arisen for the first time in the translation. But as Brüll and Ball have shown (see Speaker's Apocr. ii. 324), the same paronomasiae are possible either in Hebrew or Aramaic.

**LITERATURE.**—Ball in the Speaker's Apocr. ii. 333 sqq.; Schürer, Gesch. 3 iii. 333; Rothstein in Kautzsch's Apocr. v. Pseud. i. 176 sqq.; Kamphausen in Ency. Bib.; Marshall in Hastings' Bible Dict.; Toy in the Jewish Encyc.

**Bel and the Dragon.**—We have here two independent narratives, in both of which Daniel appears as the destroyer of heathenism. The latter had a much wider circulation than the former, and is most probably a Judaized form of the old Semitic myth of the destruction of the old dragon, which represents primeval chaos (see Ball, Speaker's Apocr. ii. 346-348; Gunkel, Schöpfung und Chaos, 320-323). Marduk destroys Tiamat in a similar manner to that in which Daniel destroys the dragon (Deltisch, Das babylonische Weltschöpfungs Epos), by driving a storm-into the dragon which rends it asunder. Marshall (Hastings' Bib. Dict. i. 267) suggests that the "pitch " of the Greek (Aramaic ἐποίησα) arose from the original term for storm-wind (ἔπων).
The Greek exists in two recensions, those of the Septuagint and Theodotion. Most scholars maintain a Greek original, but this is by no means certain. Marshall (Hastings' Bib Dict. i. 268) argues for an Aramaic, and regards Gaster's Aramaic text [Proceedings of the Society of Biblical Archaeology (1894), pp. 280-290, 312-317; (1895) 75-94] as of primary value in this respect, but this is doubtful.

**Literature.**—Fritzsche's Handbuch zu den Apost. Ball in the Speaker's Apost. ii. 344 sqq.; Schürer,3 Gesch. iii. 322 sqq.; and the articles in the Ency. Bibl., Bible Dict., and Jewish Encyc. The Greek text is best given in Swete's, and the Syriac will be found in Walton's Polyglot, Lagarde and Neubauer's Tobi. Song of the Three Children.—This section is composed of the Prayer of Azariah and the Song of Azariah, Ananias and Misael, and was inserted after iii. 23 of the canonical text of Daniel. According to Fritzsche, König, Schürer, &c., it was composed in Greek and added to the Greek translation. On the other hand, Delitzsch, Bissell, Ball, &c., maintain a Hebrew original. The latter view has been recently supported by Rothstein, Apost. and Pseud. i. 173-176, who holds that these additions were made to the text before its translation into Greek. These additions still preserve, according to Rothstein, a fragment of the original text, i.e. verses 23-28, which came between verses 23 and 24 of chapter iii. of the canonical text. They certainly fill up exactly the gap in the text referred to in this narrative. The Song of the Three Children3 was first added after the verses just referred to, and subsequently the Prayer of Azariah was inserted before these verses.

**Literature.**—Ball in the Speaker's Apost. ii. 305 sqq.; Rothstein in Kautzsch's Apost. and Pseud. i. 173 sqq.; Schürer,3 Gesch. iii. 332 sqq. (R. H. C.)

**Daniel (Dan), of Kiev, the earliest Russian travel-writer, and one of the leading Russian travellers in the middle ages. He journeyed to Syria and other parts of the Levant about 1100-1107. He was the igumen, or abbot, of a monastery probably near Chernigov in Little Russia: some identify him with one Daniel, bishop of Surire (fl. 1115-1122). He visited Palestine in the reign of Baldwin I., Latin king of Jerusalem (1100-1118), and apparently soon after the crusading capture of Acre (1104); he claims to have accompanied Baldwin, who treated him with marked friendliness, on an expedition against Damascus (c. 1107). Though Daniel's narrative, beginning (as it practically ends) at Constantinople, on the one hand, and terminating in the Crimea on the other, his work has considerable value. His picture of the Holy Land preserves a record of conditions (such as the Saracen raiding almost up to the walls of Christian Jerusalem, and the friendly relations subsisting between Roman and Eastern churches in Syria) peculiarly characteristic of the time; his account of Jerusalem itself is remarkably clear, minute and accurate; his three excursions—to the Dead Sea and Lower Jordan (which last he compares to a river of Little Russia, the Snov), to Bethlehem and Hebron, and towards Damascus—gave him an exceptional knowledge of certain regions. In spite of some extraordinary, blunders in topography and history, his observant and detailed record, marked by evident good faith, is among the most valuable of medieval documents relating to Palestine: it is also important in the history of the Russian language, and in the study of ritual and liturgy (from its description of the Easter services in Jerusalem, the Descent of the Holy Fire, &c.). Several Russian friends and companions, from Kiev and Old Novgorod, are recorded by Daniel as present with him at the Easter Eve "miracle," in the church of the Holy Sepulchre. There are seventy-six MSS. of Daniel's Narrative, of which only five are anterior to a.d. 1500; the oldest is of 1475 (St. Petersburg, Library of Ecclesiastical History 9/1086). Three editions exist, of which I. P. Saikarov's (St. Petersburg, 1849) is perhaps the best known (in Narratives of the Russians, vol. i. pp. 140-45). See also the French version in Itinéraires russes en orient, ed M. B. de Khitrovo (Geneva, 1889) (Société de l'orient latin); and the account of Daniel in C. R. Beazley, Dawn of Modern Geography, ii. 135-174.

**Daniel, Gabriel (1649-1738), French Jesuit historian, was born at Rouen on the 8th of February 1649. He was educated by the Jesuits, entered the order at the age of eighteen, and became superior at Paris. He is best known by his Histoire de France depuis l'établissement de la monarchie française (first complete edition, 1713), which was republished in 1720, 1721, 1725, 1742, and (the last edition, with notes by Father Griflet) 1755-1760. Daniel published an abridgment in 1724 (English trans., 1726), and another abridgment was published by Dorival in 1751. Though full of prejudices which affect his accuracy, Daniel had the advantage of consulting valuable original sources. His Histoire de France, and may still be consulted with advantage. Daniel also wrote a by no means successful reply to Pascal's Provincial Letters, entitled Entretiens de Cléante et d'Eudoxe sur les lettres provinciales (1694); two treatises on the Cartesian theory as to the intelligence of the lower animals, and other works. See Sennovogel, Bibliothèque de la Compagnie de Jésus, t. ii.

**Daniel, Samuel (1562-1610), English poet and historian, was the son of a music-master, and was born near Taunton, in Somersetshire, in 1562. Another son, John Daniel, was a musician, who held some offices at court, and was the author of Songs for the Lute, Viol and Voice (1606). In 1579 Samuel was admitted a commonomer of Magdalen Hall, Oxford, where he remained for about three years, and then gave himself up to the unrestrained study of poetry and philosophy. The name of Samuel Daniel is given as the servant of Lord Stafford, ambassador in France, in 1586, and probably refers to the poet. He was first encouraged and, if we may believe him, taught in verse, by the famous countess of Pembroke, whose honour he was never weary of proclaiming. He had entered his household as a tutor to her son, William Herbert. His first known work, a translation of Paulus Jovius, to which some original matter is appended, was printed in 1585. His first known volume of verse is dated 1592; it contains the cycle of sonnets to Delia and the romance called The Complaint of Rosamond. Twenty-seven of the sonnets had already been printed at the end of Sir Philip Sidney's Astrophel and Stella without the author's consent. Several editions of Delia appeared in 1592, and they were very frequently reprinted during Daniel's lifetime. We learn by internal evidence that Delia lived on the banks of Shakespeare's river, the Avon, and that the sonnets to her were inspired by her memory when the poet was in Italy. To an edition of Delia and Rosamond, in 1594, was added the tragedy of Cleopatra, a severe study in the manner of the ancients, in alternately rhyming heroic verse, diversified by stiff choral interludes. The First Four Books of the Civil Wars, an historical poem in ottava rima, appeared in 1593. The bibliography of Daniel's works is attended with great difficulty, but as far as is known was not until 1599 that there was published a volume entitled Poetical Essays, which contained, besides the "Civil Wars," "Musophilus," and "A letter from Octavia to Marcus Antonius," poems in Daniel's finest and most mature manner. About this time he became tutor to Anne Clifford, daughter of the counts of Cumberland. On the death of Spencer, in the same year, Daniel received the somewhat vague office of poet-laureate, which he seems, however, to have held only briefly, in favour of Ben Jonson. Whether it was on this occasion is not known, but about this time, and at the recommendation of his brother-in-law, Giovanni Florio, he was taken into favour at court, and wrote a Pangegric Congratulatory offered to the King at Burleigh Harrington in Rutlandshire, in ottava rima. In 1603 this poem was published, and in many cases copies contained in addition his Poetical Epistles to his patrons and an elegant prose essay called A Defence of Rime (originally printed in 1602) in answer to Thomas Campion's Observations on the Art of English Poetry, in which it was contended that rhyme was unsuited to the genius of the English language. In 1603, moreover, Daniel was appointed master of the queen's revels. In this capacity he brought out a series of masques and pastoral tragi-comedies,—of which were printed A Vision of the Twelve Goddesses, in 1603; The Queen's Arcadia, an adaptation of Guarini's Pastor Fido, in 1606; Tethys Festival or the Queenes Wake, written on the occasion of Prince Henry's becoming a Knight of the Bath, in 1610; and Hymen's Triumph, in honour...
of Lord Roxburgh's marriage in 1615. Meanwhile had appeared, in 1605, Certain Small Poems, with the tragedy of Philotas; the latter was a study, in the same style as Cloupatra, written some five years earlier. This drama brought its author into difficulties, as Philotas, with whom he expressed some sympathy, was taken to represent Essex. In 1607, under the title of Certaine small Works heretofore divulged by Samuel Daniel, the poet issued a revised version of all his works except Delia and the Civil Wars. In 1609 the Civil Wars had been completed in eight books. In 1612 Daniel published a prose History of England, from the earliest times down to the end of the reign of Edward III. This work afterwards continued, and published in 1617, was very popular with Drayton's contemporaries. The section dealing with William the Conqueror was published in 1602 as being the work of Sir Walter Raleigh, apparently without sufficient grounds.

Daniel was made a gentleman-extraordinary and groom of the chamber to Queen Anne, since no offices which offered no hindrance to an active literary career. He was now acknowledged as one of the first writers of the time. Shakespeare, Selden, and Chapman are named among the few intimates who were permitted to intrude upon the seclusion of a garden-house in Old Street, St Luke's, where, Fuller tells us, he would "lie hid for some months together, the more retir'd to enjoy the company of the Muses, and then would appear in public to converse with his friends." Late in life Daniel threw up his titular posts at court and retired to a farm called "The Ridge," which he rented at Beckington, near Devizes in Wiltshire. Here he died on the 14th of October 1610.

The poetical writings of Daniel are very numerous, but in spite of the eulogies of all the best critics, they were long neglected. This is the more singular since, during the 17th century, when so little Elizabethan literature was read, Daniel retained his poetical prestige. In later times Coleridge, Charles Lamb and others expended some of their most genial criticisms on this poet. Of his multifarious works the sonnets are now, perhaps, most read. They depart from the Italian sonnet form in closing with a couplet, as is the case with most of the sonnets of Surrey and Wyatt, but they have a grace and tenderness all their own. Of a higher order is The Complaint of Rosamond, a soliloquy in which the ghost of the murdered woman appears and bewails her fate in stanzas of exquisite pathos. Among the Epistles to Distinguished Persons will be found some of Daniel's noblest stanzas and most polished verse. The epistle to Lucy, countess of Bedford, is remarkable among those as being composed in genuine terza rima, till then not used in English. Daniel was particularly fond of a four-lined stanza of solemn alternately rhyming iambics, a form of verse distinctly misplaced in his dramas. These, inspired it would seem by like attempts of the countess of Pembroke's, are hard and frigid; his pastoral are far more pleasing; and Hymen's Triumph is perhaps the best of all his dramatic writing. An extract from this masque is given in Lamb's Dramatic Poets, and it was highly praised by Coleridge. In elegiac verse he always excelled, but most of all in his touching address To the Angel Spirit of the Most Excellent Sir Philip Sidney. We must not neglect to quote Musophilus among the most charming fragments of Daniel. It is a dialogue between a courtier and a man of letters, and is a general defence of learning, and in particular of poetical learning as an instrument in the education of the perfect courtier or man of action. It is addressed to Fulke Greville, and written, with much sententious melody, in a sort of terza rima, or, more properly, ottava rima with the couplet omitted. Daniel was a great reformer in verse, and the introducer of several valuable novelties. It may be broadly said of his style that it is full, easy and stately, without being very animated or splendid. It attains a high average of general excellence, and is content with level flights. As a gnomic writer Daniel approaches Chapman, but is far more musical and coherent. He is wanting in fire and passion, but he is prominent in scholarly grace and tender, mournful reverence.

Daniel's works were edited by A. B. Grosart in 1855-1866. (E. G.)

**Daniel, J. F. — Danнат**

**Daniel, John Frederic** (1790–1845), English chemist and physicist, was born in London on the 12th of March 1790, and in 1821 became the first professor of chemistry at the newly founded King's College, London. His name is best known for his invention of the Daniell cell (Phil. Trans., 1836), still extensively used for telegraphic and other purposes. He also invented the dew-point hygrometer known by his name (Quar. Journ. Sci., 1820), and a register pyrometer (Phil. Trans., 1839); and in 1830 he erected in the hall of the Royal Society a water-bathometer, with which he carried out a large number of observations (Phil. Trans., 1832). A process devised by him for the manufacture of illuminating gas from turpentine and resin was in use in New York for a time. His publications include Meteorological Essays, an Essay on Artificial Climate considered in its Applications to Horticulture, which showed the necessity of a humid atmosphere in hothouses devoted to tropical plants, and Introduction to the Study of Chemical Philosophy.

He died suddenly of apoplexy on the 13th of March 1845, in London, while attending a meeting of the council of the Royal Society, of which he became a fellow in 1813 and foreign secretary in 1829.

**Daniel, Thomas** (1749–1840), English landscape painter, was born at the Chertsey Inn, kept by his father, in 1749, and apprenticed to an heraldic painter. Daniel, however, was animated with a love of the romantic and beautiful in architecture and nature. Up to 1784 he painted topographical subjects and flower pieces. By this time his two nephews (see below) had come under his influence, the younger, Samuel, being apprenticed to Medland the landscape engraver, and the elder, William, being under his own care. In this year (1784) he embarked for India accompanied by William, and found at Calcutta ample encouragement. Here he remained ten years, and on returning to London he published his largest work, Oriental Scenery, in six large volumes, not completed till 1808. From 1795 till 1828 he continued to exhibit Eastern subjects, temples, jungle hunts, &c., and at the same time continued the publication of illustrated works. These are: Views of Calcutta; Oriental Scenery, 144 plates; Views in Egypt; Excursions at Ellora; Picturesque Voyage to China. These were for the most part executed in aquatint. He was elected an Academician in 1799, fellow of the Royal Society about the same time, and a member of several minor societies. His nephews both died before him; his Indian period had made him independent, and he lived a bachelor life in much respect at Kensington till his death on the 10th of March 1840.

**William Daniel** (1760–1837), his nephew, was fourteen when he accompanied his uncle to India. His own publications, engraved in aquatint, were: Voyage to India; Zoography; Animated Nature; Views of London; Views of Britain, a work prepared from his uncle's sketches; and a Voyage Round Great Britain, which occupied him several years. The British Institution made him an award of £100 for a "Battle of Trafalgar," and he was elected R.A. in 1822. He turned to panorama painting before his death, beginning in 1832 with Madras, the picture being enlivened by a representation of the Hindo mode of taming wild elephants.

**Samuel Daniel, William's younger brother, was brought up as a painter, and first appears as an exhibitor in 1792. A few years later he went to the Cape and travelled into the interior of Africa, with his sketching materials in his haversack. The drawings he made there were published, after his return, in his African Scenery. He did not rest long at home, but left for Ceylon in 1806, where he spent the remaining years of his life, publishing The Scenery, Animals and Natives of Ceylon.

**Dannat, William T.** (1838– ), American artist, was born in New York city in 1838. He was a pupil of the Royal Academy of Munich and of Munkacsy, and became an accomplished draughtsman and a distinguished figure and portrait painter. He early attracted attention with sketches and pictures made in Spain, and a large composition, "The Quartette," now in the Metropolitan Museum of Art, New York, was one of the successes of the Paris Salon of 1884. Dannat settled in Paris,
became an officer of the Legion of Honour, and is represented in the Luxembourg.

DANNECKER, JOHANN HEINRICH VON (1758–1841), German sculptor, was born at Stuttgart, where his father was employed in the stables of the duke of Württemberg, on the 15th of October 1758. The boy was entered in the military school at the age of thirteen, but after two years he was allowed to take his own taste for art. We find him at once associating with the young sculptors Scheffauer and Le Jeune, the painters Guibal and Harper, and also with Schiller, and the musician Zumsteeg. His busts of some of these are good; that of Schiller is well known.

In his eighteenth year he carried off the prize at the Concourse with his model of Milo of Crotone. On this the duke made him sculptor to the palace (1780), and for some time he was employed on child-angels and cariatides for the decoration of the reception rooms. In 1783 he left for Paris with Scheffauer, and placed himself under Pajou. His Mars, a sitting figure sent home to Stuttgart, marks this period; and we next find him, still traveling with his friend, at Rome in 1785, where he settled down to work hard for five years. Goethe and Herder were then in Rome and became his friends, as well as Canova, who was the hero of the day, and who had undoubtedly a great authoritative influence on his style. His marble statue of Ceres and Bacchus were done at the same time in the Residenz-schloss, at Stuttgart. On his return to Stuttgart, which he never afterwards quitted except for short trips to Paris, Vienna and Zürich, the double influence of his admiration for Canova and his study of the antique is apparent in his works. The first was a girl lamenting her dead bird, which pretty light motive was much admired. Afterwards, Sappho, in marble for the Lustschloss, and two offering-bearers for the Jagdschloss; Hector, now in the museum, not in marble; the complaint of Ceres, from Schiller's poem; a statue of Christ, worthy of mention for its nobility, which has been skilfully engraved by Amssler; Psyche; kneeling water-nymph; Love, a favourite he had to repeat. These stock subjects with sculptors had fresh of treatment; and the Ariadne, done a little later, especially had a charm of novelty which has made it a European favourite in a reduced size. It was repeated for the banker Von Bethmann in Frankfurt, and it now appears the ornament of the Bethmann Museum. Many of the illustrious men of the time were modelled by him. The original marble of Schiller is now at Weimar; after the poet's death it was Stalnaker's. In a corner under the empty throne of the Emperor, Countess Stephanie of Baden, General Bennendorf and others are much prized. Dannecker was director of the Gallery of Stuttgart, and received many academic and other distinctions. His death in 1841 was preceded by a period of mental failure.

DANNEWERK, or Danewirke (Danish, Dannevirk or Danewirke, "Danes' rampart"), the ancient frontier rampart of the Danes against the Germans, extending 105 m. from just south of the town of Schleswig to the marshes of the river Trene near the village of Hollingstedt. The rampart was begun by Gudrum (Godefridus), king of Westfold, early in the 9th century. In 934 it was passed by the German king Henry I., after which it was extended by King Harold Bluetooth (940–986), but was again stormed by the emperor Otto II. in 974. The chronicler Saxo Grammaticus mentions in his Gesta Danorum the "rampart of Jutland" (Juste moenia) as having been once more extended by Valdemar the Great (1157–1213), which has been cited among the proofs that Schleswig (Sønderjylland) forms an integral part of Jutland (Muses Historia, question 12, strophe 11). After the union of Schleswig and Holstein under the Danish crown, the Danewirke fell into decay, but in 1848 it was hastily strengthened by the Danes, who were, however, unable to hold it in face of the superiority of the Prussian artillery, and on the 23rd of April it was stormed. From 1850 onwards it was again repaired and strengthened at great cost, and was considered impregnable; but in the war of 1864 the Prussians turned it by crossing the Schlei, and it was abandoned by the Danes on the 6th of February without a blow. It was thereupon destroyed by the Prussians; in spite of which, however, a long line of imposing ruins still remains. The systematic excavation of these, begun in 1900, has yielded some notable finds, especially of valuable runic inscriptions (F. de Jessen, La Question de Slavie, pp. 25, 44–50, &c.).

DANESVILLE, a village of Livingston county, New York, U.S.A., 49 m. S. of Rochester, on the Canasatego Creek. Pop. (1890) 3758; (1900) 3633, of whom 417 were foreign-born; (1905) 3908; (1910) 3938. The village is served by the Delaware, Lackawanna & Western, and the Dansville & Mount Morris railways. At Dansville is the Jackson Health Resort, a large sanatorium, with which a nurses training school is connected. There is a public library. The village has large nurseries and vineyards, flour and paper mills, a large printing establishment, a foundry, and a shoe factory. Danville, named in honour of Daniel F. Faulkner, was settled about 1800, and was incorporated in 1845.

DANTE, Dante (or Durante) Alighieri (1265–1321), the greatest of Italian poets, was born at Florence about the middle of May 1265. He was descended from an ancient family, but from one which at any rate for several generations had belonged to the burgher and knightly class. His biographers have attempted to trace him back to the Frangipani, one of the oldest senatorial families of Rome. We can affirm with greater certainty that he was connected with the Elsiei who took part in the building of Florence under Charles the Great. Dante himself does not, with the exception of a few obscure and scattered allusions, carry his ancestry beyond the warrior Cacciaguida, whom he met in the sphere of Mars (Par. xvi. 87, foll.). Of Cacciaguida's family nothing is known. The name, as he told Dante (Par. xv. 139, 5), was given him at his baptism; it has a Teutonic ring. The family may well have sprung from one of the barons who, as Villani tells us, remained behind Otto I. It has been noted that the phrase "Tonde venner qui vi (xvi. 44) seems to imply that they were not Florentines. He further tells his descendant that he was born in the year 1166 (or, if another reading of xvi. 37, 38 be adopted, in 1191), and that he married an Aldighieri from the valley of the Po. Here the German strain appears unmistakably; the name Aldighiero (Aldiger) being purely Teutonic. He also mentions two brothers, Montone and Enrico, and to them he acknowledged the exaltation of Cosimo III. upon his crusade into the Holy Land, when he died (1147) among the infidels. From Eliseo was probably descended the branch of the Elsiei; from Aldighiero, son of Cacciaguida, the branch of the Alighieri. Bellincione, son of Aldighiero, was the grandfather of Dante. His father was a second Aldighiero, a lawyer of some reputation. By his first wife, Lapa di Chiariissimo Cialuffi, this Aldighiero had a son Francesco; by his second, Donna Bella, whose family name is not known, Dante and a daughter. Thus the family of Dante held a most respectable position among the citizens of his beloved city; but had it been reckoned in the very first rank they could not have remained in Florence after the defeat of the Guelphs at Montaperti in 1260. It is clear, however, that Dante's mother at least did so remain, for Dante was born in Florence in 1265. The heads of the Guelph party did not return till 1267.

Dante was born under the sign of the twins, "the glorious stars pregnant with virtue, to whom he owes his genius such as it is." Astrologers considered this constellation as favourable to literature and science, and Brunetto Latini, the philosopher and diplomatist, speaks in this sense of the poet (De natura rerum, xx. 24). Hence, if he follows its guidance, he cannot fail to reach the harbour of fame. Boccaccio relates that before his birth his mother dreamed that she lay under a very lofty laurel, growing in a green meadow, by a very clear fountain, when she felt the pains of childbirth,—that her child, feeding on the berries which fell from the laurel, and on the waters of the fountain, in a very short time became a shepherd, and attempted to reach the leaves of the laurel, the fruit of which had nurtured him,—that, trying to obtain them he fell, and rose up, no longer a man, but in the guise of a cock. We know little of Dante's boyhood except that he was a hard student and was profoundly influenced by...
Brunetto Latini. Boccaccio tells us that he became very familiar with Virgil, Horace, Ovid and Statius, and all other famous poets. From the age of eighteen he, like most cultivated young men of that age, wrote poetry assiduously, in the philosophical andatory style of which his friend, older by many years than himself, Guido Cavalcanti, was a great exponent, and of which Dante regarded Guido Guinicelli of Bologna as the master (Purg. xxvi. 97, 8). Leonardo Bruni of Arezzo, writing a hundred years or more after his death, says that “by study of philosophy, of theology, astrology, arithmetic and geometry, by reading of history, by the turning over many curious books, watching and sweating in his studies, he acquired the science which he was to adorn and explain in his verses.” Of Brunetto Latini Dante himself speaks with the most loving gratitude and affection, though he does not hesitate to brand his vice with infamy. Under such guidance Dante became master of all the science of his age at a time when it was not impossible to know all that could be known. He had some knowledge of drawing; at any rate he tells us that on the anniversary of the death of Beatrice he drew an angel on a tablet. He was an intimate friend of Giotto, who has immortalized his figure in lineaments of the chapel of the Bargello, and who is recorded to have drawn from his friend’s inspiration the allegories of Virtue and Vice which fringe the frescoes of the Scrovegni Chapel at Padua. Nor was he less sensible to the delights of music. Milton had not a keener ear for the loud uplifted angel trumpets and the immortal harps of golden wires of the cherubim and seraphim; and the English poet was proud to compare his own friendship with Henry Lawes with that between Dante and Casolla, “met in the milder shades of purgatory.” Of his companions the most intimate and sympathetic were the lawyer-poet Cino of Pistoia, Lapo Gianni, Guido Cavalcanti and others, similarly gifted and dowered with like tastes, who moved in the lively and acute society of Florence, and felt with him the first warm flush of the new spirit which was soon to pass over Europe. He has written no sweeter or more melodious lines than those in which he expresses the wish that he, with Guido and Lapo, might be wafted by enchantment over the sea wheresoever they might list, shielded from tempest and foul weather, in such contentment that they should wish to live always in one mind, and that the good enfant should bring Monna Vanna and Monna Bice and that other lady into their barque, where they should for ever discourse of love and be for ever happy. It is a wonderful thing (says Leonardo Bruni) that, though he studied without interruption, it would not have appeared to anyone that he studied, from his joyous mien and youthful conversation. Like Milton he was trained in the strictest academical education which the age afforded; but Dante lived under a warmer sun and brighter skies, and found in the rich variety and gaiety of his early life a defense against the withering misfortunes of his later years. Milton felt too early the chill breath of Puritanism, and the serious musing on the experience of life, which saddened the verse of both poets, deepened in his case rather into grave and desponding melancholy, than into the fierce scorn and invective which disillusion wrung from Dante. We must remember that Dante’s was in which the life of Dante’s manhood. From 1115, the year of the death of Matilda countess of Tuscany, to 1215, Florence enjoyed a nearly uninterrupted peace. Attacked by the Guelf party, it remained undivided against itself. But in 1215 a private feud between the families of Buondelmonte and Uberti introduced into the city the horrors of civil war. Villani (lib. v. cap. 38) relates how Buondelmonte de’ Buondelmonti, a noble youth of Florence, being engaged to marry a lady of the house of Amidei, allied himself instead to a Donati, and how Buondelmonte was attacked and killed by the Amidei and Uberti at the foot of the Ponte Vecchio, close by the pilaster which bears the image of Mars. “The death of Messer Buondelmonte was the occasion and beginning of the accused parties of Guelphs and Ghibellines in Florence.” Of the seventy-two families then in Florence thirty-nine became Guelp in the leadership of the Buondelmonte and the rest Ghibelline under the Uberti. The strife of parties was for a while allied by the war against Pisa in 1222, and the constant struggles against Siena; but in 1248 Frederick II. sent into the city his natural son Frederick “of Antioch,” with 1600 German knights. The Guelphs were driven away from the town, and took refuge, part in Montevarchi, part in Capraia. The Ghibellines, masters of Florence, behaved with great severity, and destroyed the towers and palaces of the Guelp nobles. At last the people became impatient. They rose in rebellion, reduced the powers of the podestà, elected a captain of the people to manage the internal affairs of the city, with a council of twelve, established a more democratic constitution, and, encouraged by the death of Frederick II. in December 1259, recalled the exiled Guelphs. Manfred, the bastard son of Frederick, pursued the policy of his father. He stimulated the Ghibelline Uberti to rebel against their position of subjection. A rising of the vanquished party was put down by the people, in July 1258 the Ghibellines were expelled from the town, and the towers of the Uberti razed to the ground. The exiles betook themselves to the friendly city of Siena. Manfred sent them a reinforcement of German horse, under his kinsman Count Giordano Lancia. The Florentines, after vainly demanding their surrender, despatched an army against them. On the 4th of September 1260 was fought the great battle of Montaperti, which dyed the Arbia red, and in which the Guelphs were entirely defeated. The hand which held the banner of the republic was unwatered by the sword of a traitor (Inf. xxxii. 106). For the first time in the history of Florence the Carroccio was taken. Florence lay at the mercy of her enemies. A parliament was held at Empoli, in which the deputies of Siena, Pisa, Arezzo and other Tuscan towns consulted on the best means of securing their new war power. They voted that the accused Guelp city should be blotted out. But Farinata degli Uberti stood up in their midst, bold and defiant as when he stood erect among the sepulchres of hell, and said that if, from the whole number of the Florentines, he alone should remain, he would not suffer, whilst he could wield a sword, that his country should be destroyed, and that, if it were necessary to die a thousand times for her, a thousand times would he be ready to encounter death. Help came to the Guelphs from an unexpected quarter. Clement IV., elected pope in 1265, offered the crown of Apulia and Sicily to Charles of Anjou. The French prince, passing rapidly through Lombardy, Romagna and the Marches, reached Rome by way of Spoleto, was crowned on the 6th of January 1266, and on the 23rd of February defeated and killed Manfred at Benevento. In such a storm of conflict did Dante first see the light. In 1267 the Guelphs were recalled, but instead of settling down in peace with their opponents they summoned Charles of Anjou to vengeance, and the Ghibellines were driven out. The meteor passage of Conradin gave hope to the imperial party, which was quenched when the head of the fair-haired boy fell on the scaffold at Naples. Pope after pope tried in vain to make peace. Gregory X. placed the rebellious city under an interdict; in 1278 Cardinal Latini by order of Nicholas III. effected a truce, which lasted for four years. The city was to be governed by a committee of fourteen buenomini, on which the Guelphs were to have a small majority. In 1282 the constitution of Florence received the final form which it retained till the collapse of freedom. From the three arti maggiori were chosen six priors, in whose hands was placed the government of the republic. Before the end of the century, seven greater arts were recognized, including the speciali,—druggists and dealers in all manner of oriental goods, and in books—among whom Dante afterwards enrolled himself. They remained in office for two months, and during that time lived and shared a common table in the public palace. We shall see what influence this office had upon the fate of Dante. The success of the “Sicilian Vespers” (March 1282), the death of Charles of Anjou (January 1285), and of Martin IV. in the following March, roused against the courage of the Ghibellines. They entered Arezzo, where the Ghibellines at present had the upper hand, and threatened to drive out the Guelphs from Tuscany. Skirmishes and raids, of which Villani and Bruni have left accounts, went on through the winter of 1289-1289, forming a prelude to the great
battle of Campaldino in the following summer. Then it was that Dante saw "horsemen moving camp and commencing the assault, and holding muster, and the march of foragers, the shock of tournaments, and race of jousts, now with trumpets and now with bells, with drums and castle signals, with native things and foreign" (Inf. xxi. 1, fol.). On the 1st of June 1289, at Campaldino near Poppa, in the Casentino, the Ghibellines were utterly defeated. They never again recovered their hold on Florence, but the violence of faction survived under other names. In a letter quoted, though not at first hand, by Leonardo Bruni, which is not now extant, Dante is said to mention that he himself fought with distinction at Campaldino. He was present shortly afterwards at the battle of Caprona (Inf. xxi. 95, fol.), and returned in September 1289 to his studies and his love. His peace was of short duration. On the 9th of June 1290 died Beatrice, whose mortal love had guided him for thirteen years, and whose immortal spirit purified his later life, and revealed to him the mysteries of Paradise.

Dante had first met Beatrice Portinari at the house of her father Folco on May-day 1274. In his own words, "already nine times after my birth the heavy light of love had returned as it were to the same point, when there appeared to my eyes, as it were in a vision, the most illustrious lady of my times, called Beatrice who knew not what to call her. She had already been so long in this life that already in its time the starry heaven had moved towards the east the twelfth part of a degree, so that she appeared to me about the beginning of her ninth year, and I saw her about the end of my ninth year. Her dress on that day was of a most noble colour, a subdued and goodly crimson, girdled and adorned in such sort as best suited with her tender age. At that moment I saw most truly that the spirit of life which hath its dwelling in the secretest chamber of the heart began to tremble so violently that the least pulses of my body shook therewith; and in trembling it said these words, 'Ecce deus fortior me qui veniens dominabitur mihi.'" In the Vita Nuova is written the story of his passion from its commencement to within a year after the lady's death (June 9th, 1290). He saw Beatrice only once or twice, and she probably knew little of him. She married Simone de' Bardi. But the worship of her lover was stronger for the remoteness of its subject. The last chapter of the <i>Vita Nuova</i> relates how, after the lapse of a year, "it was given me to behold a vision wherein I saw things which determined me to say nothing further of this blessed one until such time as I could discourse more worthily concerning her. And to this end I labour all I can, as she in truth kneweth. Therefore if he Base pleasure through whom is the life of all things that my life continue with me a few years, it is my hope that I shall yet write concerning her what hath not before been written of any woman. After which may it seem good unto Him who is the master of grace that my spirit should go hence to behold the glory of my lady, to wit, of that blessed Beatrice who now gloriously gazes on the countenance of Him qui est per omnia saecula saeculorum." In the <i>Convito</i> he resumes the story of his life. "When I had lost the first delight of my soul (that is, Beatrice) I remained so pierced with sadness that no comfort availed me anything, yet after some time my mind, desirous of health, sought to return to the method by which other disconsolate ones had found consolation, and I set myself to read that little-known book of Boetius in which he consoled himself when a prisoner and an exile. And here it happened that Tully had written another work, in which, treating of friendship, he had given words of consolation to Laelius, I set myself to read that also." He so far recovered from the shock of his loss that in 1292 he married Gemma, daughter of Manetto Donati, a connexion of the celebrated Corso Donati, afterwards Dante's bitter foe. It is possible that she is the lady mentioned in the <i>Vita Nuova</i> as sitting full of pity at her window and comforting Dante for his sorrow. By this wife he had two sons and two daughters, and although he never mentions her in the <i>Divina Commedia</i>, and although she did not accompany him into exile, there is no reason to suppose that she was other than a good wife, or that the union was otherwise than happy. Certain it is that he spares the memory of Corso in his great poem, and speaks kindly of his kinsman Piccarda and Forese.

In 1293 Giano della Bella, a man of old family who had thrown his lot with the people, induced the commonwealth to adopt the so-called "Ordinances of Justice," a severely democratic constitution, by which among other things it was enacted that no man of noble family, even though engaged in trade, could hold office as prior. Two years later Giano was banished, but the ordinances remained in force, though the grands recovered much of their power.

Dante now began to take an active part in politics. He was inscribed in the <i>arte of the Medici and Speziati</i>, which made him eligible as one of the six <i>priores</i> to whom the government of the city was entrusted in 1282. Documents still existing in the archives of Florence show that he took part in the deliberations of the several councils of the city in 1295, 1296, 1300 and 1301. The notice in the last year is of some importance. The pope had demanded a contingent of 100 Florentine knights to serve against his enemies, the Colonna family. On the 19th of June we read in the contemporary report of the debate on this question in the Council of a Hundred: "Dantes Aligherius consultui quod de servitio faciendo Domino Papae nihil fieret."

Other instances of his invariable opposition to Boniface occur. He is described as "in the saintly spirits and disposition of a man not only unsupported by evidence, but impossible in itself. Filifolo does not mention the only embassy in which we know for certain that Dante was engaged, that to the town of San Gimignano in May 1290. From the 15th of June to the 15th of August 1300 he held the office of prior, which was the source of all the miseries of his life. The spirit of faction had again broken out in Florence. The two rival families were the Cerchi and the Donati,—the first of great wealth but recent origin, the last of ancient ancestry but poor. A quarrel had arisen in Pistoia between the two branches of the Cancellieri,—the Bianchi and Neri, the Whites and the Blacks. The quarrel spread to Florence, the Donati took the side of the Blacks, the Cerchi of the Whites. Pope Boniface was asked to mediate, and sent Cardinal Matteo d'Acquasparta to maintain peace. He arrived just as Dante entered upon his office as prior. The cardinal effected nothing, but Dante and his colleagues banished the heads of the rival parties in different directions to a distance from the capital. The Blacks were sent to Città della Pieve in the Tuscan mountains; the Whites, among whom was Dante's inmost friend Guido Cavalcanti, to Serrezzano in the unhealthy Maremma. After the expiration of Dante's office both parties returned, Guido Cavalcanti so ill with fever that he shortly afterwards died. At a meeting held in the church of the Holy Trinity the Whites were denounced as Ghibellines, enemies of the pope. The Blacks sought for vengeance. Their leader, Corso Donati, hastened to Rome, and persuaded Boniface VIII. to send for Charles of Valois, brother of the French king, Philip the Fair, to act as "peacemaker." The prior sent at the end of September four ambassadors to the pope, one of whom, according to the chronicler Dino, was Dante. There are, however, improbabilities in the story, and the passage quoted in support of it bears marks of later interpolation. He never again saw the towers of his native city. Charles of Valois, after visiting the pope at Anagni, retraced his steps to Florence, entering the city on All Saints' Day and taking up his abode in the Otr' Arno. Corso Donati, who had been banished a second time, returned in force and summoned the Blacks to arms. The gates were broken open, the podestà driven from the town, the Cerchi confined within their houses, a third of the city was destroyed with fire and sword. By the help of Charles the Blacks were victorious. They appointed Cante de' Gabrielli of Gubbio as podestà, a man devoted to their interests. More than 600 Whites were condemned to exile and cast as beggars upon the world. On the 27th of January 1302, Dante, with four others of the White party, was charged before the podestà, Cante de' Gabrielli, with baratteria, or corrupt jobbery and peculation when in office, and, not appearing, condemned to pay a fine of 5000 lire of small florins. If the money was not paid within three days their property was to be destroyed and laid waste; if they did pay the fine they were to be exiled for two years from Tuscany; in any case they were never again to hold office in the
The charge in Dante's case was obviously preposterous, though ingeniously devised; for he was known to be at the time in somewhat strained circumstances, and had recently been in control of public works. But of all sins, that of "bartray" was one of the most hateful to him. No doubt the papal finger may be traced in the affair. On the 10th of March Dante and fourteen others were condemned to be burned alive if they should come into the power of the republic. Similar sentences were passed in September 1311 and October 1315. The sentence was not formally reversed till 1494, under the government of the Medici.

Leonardo Bruni, who accepts the story of the embassy to Rome, states that Dante received the news of his banishment in that city, and at once joined the other exiles at Siena. How he escaped arrest in the papal states is not explained. The exiles met first at Gargonza, a castle between Siena and Arezzo, and then at Arezzo itself. They joined themselves to the Ghibellines, to which party the podesta Ugiccione della Faggiuola belonged. The Ghibellines, however, were divided amongst themselves, and the more strict Ghibellines were not disposed to favour the cause of the White Guelphs. On the 8th of June 1302, however, a meeting was held at San Godenzo, a place in the Florentine territory, Dante's presence at which is proved by documentary evidence, and an alliance was there made with the powerful Ghibelline clan of the Ubaldrini. The exiles remained at Arezzo till the summer of 1304. In September 1303 the fleur-de-lis had entered Anagni, and Christ had a second time been made prisoner in the person of his vicar. At the instance of Philip the Fair, William of Nogaret and Sciarra Colonna had entered the papal palace at Anagni, and had insulted and, it is said, even beaten the aged pontiff under his own roof. Boniface did not survive the insult long, but died in the following month. He was succeeded by Benedict XI, and in March the cardinal da Prato came to Florence, sent by the new pope to make peace. The people received him with enthusiasm; ambassadors came to him from the Whites; and he did his best to reconcile the two parties. But the Blacks resisted all his efforts. He shook the dust from off his feet, and departed, leaving the city under an interdict. Foiled by the calamities and machinations of the one party, the cardinal gave his countenance to the other. It happened that Corso Donati and the heads of the Black party were absent at Pistoia. Da Prato advised the Whites to attack Florence, deprived of its heads and impaired by a recent fire. An army was collected of 16,000 foot and 9000 horse. Communications were opened with the Ghibellines of Bologna and Romagna, and a futile attempt was made to enter Florence from Lastra, the failure of which further disorganized the party. Dante had, however, already separated from the "ill-conditioned and foolish company" of common party-politicians, who rejected his counsels of wisdom, and had learnt that he must henceforth form a party by himself. In 1303 he had left Arezzo and gone to Forli in Romagna, of which city Scarpetta degli Ordelaffi was lord. To him, according to Flavio Blondus the historian (d. before 1481), a native of the place, Dante acted for a time as secretary.

From Forli Dante probably went to Bartolommeo della Scala, lord of Verona, where the country of the great Lombard gave him his first refuge and his first hospitable reception. Can Grande, to whom he afterwards dedicated the Paradiso, was then a boy. Bartolommeo died in 1304, and it is possible that Dante may have remained in Verona till his death. We must consider, if we would understand the real nature of Dante's Ghibellinism, that he had been born and bred a Guelph; but he saw that the conditions of the time were altered, and that other dangers menaced the welfare of his country. There was no fear now that Florence, Siena, Pisa, Arezzo should be razed to the ground in order that the castle of the lord might overlook the humble cottages of his contented subjects; but there was danger lest Italy should be torn in sunder by its own jealousies and passions, and lest the fair domain bounded by the sea and the Alps should never properly assert the force of its individuality, and should present a contemptible contrast to a united France and a confederated Germany. Sick with petty quarrels and dissensions, Dante strained his eyes towards the hills for the appearance of a universal monarch, raised above the jars of faction and the spurr of ambition, under whom each country, each city, each man, might, under the institutions best suited to it, lead the life and do the work for which it was best fitted. United in spiritual harmony with the vicar of Christ, he should show for the first time to the world an example of a government where the strongest force and the highest wisdom were interpenetrated by all that God had given to the world of piety and justice. In this sense and in no other was Dante a Ghibelline. The vision was never realized—the hope was never fulfilled. Not till 500 years later did Italy become united and the "greyhound of deliverance" chase from city to city the wolf of cupidity. But is it possible to say that the dream did not work its own realization, or to deny that the high ideal of the poet, after inspiring a few minds as lofty as his own, has become embodied in the constitution of a state which acknowledges no stronger bond of union than a common worship of the exile's indignant and impassioned verse?

It is very difficult to determine with exactness the order and the place of Dante's wanderings. Many cities and castles in Italy have claimed the honour of giving him shelter, or of being for a time the home of his inspired muse. He certainly spent some time with Count Guido Salvatico in the Casentino near the sources of the Arno, probably in the castle of Forelano, and with Ugiccione in the castle of Faggiuola in the mountains of Urbino. After this he is said to have visited the university of Bologna; and in August 1306 we find him at Padua. Cardinal Napoleon Orsini, thelegate of the French pope Clement V., had put Bologna under a ban, dissolved the university and driven the professors to the northern city. In May or June 1307 the same cardinal collected the Whites at Arezzo and tried to induce the Florentines to recall them. The name of Dante is found attached to a document signed by the Whites in the church of St Gaudenzio in the Mugello. This enterprise came to nothing. Dante retired to the castle of Moroello Malespina in the Lupignana, where the marble ridges of the mountains of Carrara descend in precipitous slopes to the Gulf of Spezia. From this time till the arrival of the emperor Henry VII. in Italy, October 1310, all is uncertain. His old enemy Corso Donati had at last allied himself with Ugiccione della Faggiuola, the leader of the Ghibellines. Dante thought it possible that this might lead to his return. But in 1308 Corso was declared a traitor, attacked in his house, put to flight and killed. Dante lost his hope. He left Tuscany, and went to Can Grande della Scala at Verona. From this place it is thought that he visited the university of Paris (1309), studied in the rue du Fournier and went on into the Low Countries. That he ever crossed the Channel or went to Oxford, or himself saw where the heart of Henry, son of Richard, earl of Cornwall, murdered by his cousin Guy of Montfort in 1271, was "still venerated on the Thames," may safely be disbelieved. The only evidence for it is in the Commentary of John of Serravalle, bishop of Fermo, who lived a century later, and who had no special opportunity of knowing, and was writing for the benefit of two English bishops. The election in 1320 of Henry of Luxemburg as emperor stirred again his hopes of a deliverer. At the end of 1310, in a letter to the princes and people of Italy, he proclaimed the coming of the saviour; at Milan he did personal homage to his sovereign. The Florentines made every preparation to resist the emperor. Dante wrote from the Casentino a letter dated the 31st of March 1311, in which he rebuked them for their stubbornness and obstinacy. Henry still lingered in Lombardy at the siege of Cremona, when Dante, on the 16th of April 1311, in a celebrated epistle, upbraided his delay, argued that the crown of Italy was to be won on the Arno rather than on the Po, and urged the tarrying emperor to hew the rebellious Florentines like Agag in pieces before the Lord. Henry was as deaf to this exhortation as the Florentines themselves. After reducing Lombardy he passed from Genoa to Pisa, and on the 29th of June 1322 was crowned by some cardinals in the church of St John Lateran at Rome; the Vatican being in the hands of his adversary King Robert of Naples. Then at length he moved towards...
DANTE

Tuscany by way of Umbria. Leaving Cortona and Arezzo, he reached Florence on the 15th of September. He did not dare to attack it, but returned in November to Pisa. In the summer of the following year he prepared to invade the kingdom of Naples; but in the neighbourhood of Siena he caught a fever and died at the monastery of Buonconvento, on the 24th of August 1321. He lies in the Campo Santo of Pisa; and the hopes of Dante and his party were buried in his grave.

Old age and death.

After the death of the emperor Henry (Bruni tells us) Dante passed the rest of his life as an exile, sojourning in various places throughout Lombardy, Tuscany, and the Romagna, under the protection of various lords, until at length he retired to Ravenna, where he ended his life. Very little can be added to this meagre story. There is reason for supposing that he stayed at Gubbio with Bosone dei Raffaeli, and tradition assigns him a cell in the monastery of Sta Croce di Fonte Avellana in the same district, situated on the slopes of Catria, one of the highest peaks of the Apennines in that region. After the death of the French pope, Clement V, he addressed a letter, dated the 14th of July 1314, to the cardinals in conclave, urging them to elect an Italian pope. About this time he came to Lucca, then lately conquered by his friend Uguccione. Here he collected the mss. of the organs that were then in store for Uguccione, and here he must have become acquainted with Gentucca, whose name had been whispered to him by his countryman on the slopes of the Mountain of Purification (Par, xxiv. 37). That the intimacy between the "world-worn" poet and the young married lady (who is thought to be identifiable with Gentucca Morla, wife of one Cosciorno Fondora) was other than blameless, is quite incredible. In August 1315 was fought the battle of Monte Catini, a day of humiliation and mourning for the Guelfs. Uguccione made but little use of his victory; and the Florentines marked their vengeance on his adviser by condemning Dante yet once again to death if he ever should come into their power. In the beginning of the following year Uguccione lost both his cities of Pisa and Lucca. At this time Dante was offered an opportunity of returning to Florence. The conditions given to the exiles were that they should pay a fine and walk in the dress of humiliation to the church of St John, and there do penance for their offences. Dante refused to tolerate this shame; and the letter is still extant in which he declines to enter this "stage except out of love, security of hope, which will not fail him. and that in any part of the world he will be able to gaze at the sun and the stars, and meditate on the sweetest truths of philosophy. He preferred to take refuge with his most illustrious protector Can Grande della Scala of Verona, then a young man of twenty-five, rich, liberal and the favoured head of the Gibelline party. His name has been immortalized by an eloquent panegyric in the seventeenth canto of the Paradiso. Whilst on a visit at the court of Verona he maintained, on the 20th of January 1320, the philosophical thesis De aqua et terra, on the levels of land and water, which is included in his minor works. The last three years of his life were spent at Ravenna, under the protection of Guido da Polenta. In his service Dante undertook an embassy to the Venetians. He failed in the object of his mission, and, returning disheartened and broken in spirit through the unhealthy lagoons, caught a fever and died in Ravenna on the 14th of September 1321. His bones still repose there. His doom of exile has been reversed by the union of Italy, which has made the city of his birth and the various cities of his which kings component members of a common country. His son Piero, who wrote a commentary on the Divina Commedia, settled as a lawyer in Verona, and died in 1364. His daughter Beatrice lived as a nun in Ravenna, dying at some time between 1350 (when Boccaccio brought her a present of ten gold crowns from a Florentine gild) and 1370. His direct line became extinct in 1509.

Dante's Works.—Of Dante's works, that by which he is known to all the educated world, and in virtue of which he holds his place as one of the half-dozen greatest writers of all time, is of course the Commedia. (The epithet divina, it may be noted, was not given to the poem by its author, nor does it appear on a title-page until 1555, in the edition of Ludovico Dolce, printed by Giulio; though it is applied to the poet himself as early as 1574.) The poem is absolutely unique in literature; it may safely be said that at no other epoch of the world's history could such a work have been produced. Dante was steeped in all the learning, which in its way was considerable, of his time; he had read the Summa Theologica of Aquinas, the Trèsor of his master Brunetto, and other encyclopaedic works available in that age; he was familiar with all that was then known of the Latin classical and post-classical authors. Further, he was a deep and original political thinker, who had himself borne a prominent part in practical politics. He was born into a generation in which almost every man of education habitually wrote verse, as indeed their predecessors had been doing for the last fifty years. Vernacular poetry had come late into Italy, and had hitherto, save for a few didactic or devotional treatises hitched into rough rhyme, been exclusively lyric in form. Amaryllis at first, later, chiefly in the hands of Guittone of Arezzo and Guido Cavalcanti, taking an ethical and metaphysical tone, it had never fully shaken off the Provengal influence under which it had started, and of which Dante himself shows considerable traces.

The age also was unique, though the two great events which explode and shape the spirit of the 13th century, i.e., the invention of printing and the discovery of the new world (to which might perhaps be added the intrusion of Islam into Europe)—were still far in the future. But the age was essentially one of great men; of free thought and free speech; of brilliant and daring action, whether for good or evil. It is easy to understand how Dante's bitterest scorn is reserved for those "sorry souls who lived without infamy and without renown, displeasing to God and to His enemies."

The time was thus propitious for the production of a great imaginative work, and the man was ready who should produce it. It called for a prophet, and the prophet said, "Here am I." "Dante," says an acute writer, "is not, as Homer, is, the father of poetry springing in the freshness and simplicity of childhood out of the arms of mother earth; he is rather, like Noah, the father of a second poetical world, to whom he pours forth his prophetic song fraught with the wisdom and the experience of the old world." Thus the Commedia, though often classed with the few of a better description among epic poems, is totally different in aim, and in the characteristics of both its "hero": the incidents do not modify the course of the story; the place of episodes is taken by theological or metaphysical disquisitions; the world through which the poet takes his readers is peopled, not with characters of heroic story, but with men and women known personally or by reputation and those for whom he wrote. Its aim is not to delight, but to reprove, to rebuke, to exhort; to form men's characters by teaching them what courses of life will meet with reward, what with penalty, hereafter; "to put into verse," as the poet says, "things difficult to think." For such new matter a new vehicle was needed. We have Bembo's authority for believing that the terza rima, surpass, if at all, only by the ancient hexameter, as a measure equally adaptable to sustained narrative, to debate, to fierce invective, to clear-cut picture and to trenchant epigram, was first employed by Dante.

The action of the Commedia opens in the early morning of the Thursday before Easter, in the year 1300. The poet finds himself lost in a forest, escaping from which he has his way barred by a wolf, a lion, and a leopard. All which, like the rest of the poem, is highly symbolic. This branch of the subject is too vast to be entered on at any length here; but so far as this passage is concerned it may be said that it seems to indicate that at this period of his life, about the age of thirty-five, Dante went through some experience akin to what is now called "conversion." Having led up till then the ordinary life of a cultivated Florentine of good family; taking his part in public affairs, military and civil, as an hereditary member of the predominant Guelp party; dallying in prose which with all its beauty and passion is full of the conceits familiar to the 13th century, and in verse which save for the excellence of its execution differs in no way from that of his
predecessors, with the memory of his lost love; studying more seriously, perhaps, than most of his associates; possibly travelling a little, gradually or suddenly he became convinced that all was not well with him, and that not by leading, however blameless, the “active” life could he save his soul. The strong vein of mysticism, found in so many of the deepest thinkers of that age, and conspicuous in Dante’s mind, no doubt played its part. His efforts to free himself from the “forest” of worldly cares were impeded by the temptations of the world—cupidity (including ambition), the pride of life and the lusts of the flesh, symbolized by the three beasts. But a helper is at hand. Virgil appears and explains that he has a commission from three ladies on high to guide him. The ladies are the Blessed Virgin, St. Lucy (whom for some reason never yet explained Dante seems to have regarded as in a special sense his protector) and Beatrice. In Virgil we are apparently intended to see the symbol of what Dante calls philosophy, what we should rather call natural religion; Beatrice standing for theology, or rather revealed religion. Under Virgil’s escort Dante is led through the two lower realms of the world, Hell and Purgatory; meeting on the way with many persons illustrious or notorious in recent or remoter times, as well as many well known then in Tuscany and its neighbour- ing provinces; but who, were the immortals, often of able, that the poet has conferred on them, would long ago have been forgotten. Popes, kings, emperors, poets and warriors, Florentine citizens of all degrees, are there found; some doomed to hopeless punishment, others expiating their offences in milder torments, and looking forward to deliverance in due time. It is remarkable to notice how rarely, if ever, Dante allows political sympathy or antagonism to influence him in his distribution of judgment. Hell is conceived as a vast conical hollow, reaching to the centre of the earth. It has three great divisions, corresponding to Aristotle’s three classes of vices, incontinence, brutality and malice. The first are outside the walls of the city of Dis; the second, among whom are included unbelievers, tyrants, suicides, unnatural offenders, usurers, are within; the first apparently on the same level as those without, the rest separated from them by a steep descent of broken rocks. (It should be said that many Dante scholars hold that Aristotle’s “brutishness” has no place in Dante’s scheme; but the symmetry of the arrangement, the special reference made to that division, and certain extracts which have been discovered, and the fact that that would here, as in most other cases, have followed his master in philosophy.) The sinners by malice, which includes all forms of fraud or treachery, are divided from the last by a yet more formidable barrier. They lie at the bottom of a pit, the depth of which is not stated, with vertical sides, and accessible only by supernatural means; a monster named Geryon bearing the poets down on his back. The torments here are of a more terrible, often of a loathsome character. Ignominy is added to pain, and the nature of Dante’s demeanour towards the sinners changes from pity to hatred. At the very bottom of the pit is Lucifer, immovably fixed in ice; climbing down his limbs they reach the centre of the earth, whence a craney conducts them back to the surface, at the foot of the purgatorial mountain, which they reach as Easter Day is dawning. Before the actual Purgation is attained they have to climb for the latter half of the day and rest at night. The occupants of this outer region are those who have delayed repentance till death was upon them. They include many of the most famous men of the last thirty years. In the midst of the gate is opened, and Beatrice’s last prophecies are entered. This is divided into seven terraces, corresponding to the seven deadly sins, which encircle the mountain and have to be reached by a series of steep climbs, compared by Dante in one instance to the path from Florence to Samminiato. The penalties are not degrading, but rather tests of patience or endurance; and in several cases Dante has to bear a share in them as he passes. On the summit is the Earthly Paradise. Here Beatrice appears, in a mystical pageant; Virgil departs, leaving Dante in her charge. By her he is led through the various spheres of which, according to both the astronomy and the theology of the time. Heaven is composed, to the supreme

Heaven, or Empyrean, the seat of the Godhead. For one moment there is granted him the intuitive vision of the Deity, and the comprehension of all mysteries, which is the ultimate goal of mystical theology; his will is wholly blinded with that of God, and the poem ends.

The Convito, or Banquet, also called Convivio (Rembo uses the first form, Trissino the other), is the work of Dante’s manhood, as the Vita Nuova is the work of his youth. It consists, in the form in which it has come down to us, of an introduction and three treatises, each forming an elaborate commentary in a long canzone. It was intended, if completed, to have comprised commentaries on eleven more canzoni, making fourteen in all, and in this shape would have formed a tesoro or handbook of universal knowledge, such as Brunetto Latini and others have left to us. It is perhaps the least well known of Dante’s Italian works, but crabbed and unattractive as it is in many parts, it is well worth reading, and contains many passages of great beauty and elevation. Indeed a knowledge of it is quite indispensable to the full understanding of the Divina Commedia and the De Monarchia. The time of its composition is uncertain. It as it stands has very much the look of being the commentaries on books arranged by Dante in his lifetime, who died in 1321. He does not mention Henry VII, as emperor, who succeeded in 1310. There are some passages which seem to have been inserted at a later date. The canzoni upon which the commentary is written were probably composed between 1292 and 1300, when he was seeking in philosophy consolation for the loss of Beatrice. The Convito was first printed in Florence by Buonaccorsi in 1490. It has never been adequately edited.

The Vita Nuova (Young Life or New Life, for both significations seem to be intended) contains the history of his love for Beatrice. He describes how he met Beatrice as a child, himself a child, how he often sought her glance, how she once greeted him in the street, how he feigned a false love to hide his true love, how he fell ill and saw in a dream the death and transfiguration of his beloved, how she died, and how his health failed from sorrow, how the tender compassion of another lady nearly won his heart from its first affection, how Beatrice appeared to him in a vision and reclaimed his heart, and how at last he saw a vision which induced him to devote himself to study that he might be more fit to glorify her who gazes on the face of God for ever. This simple story is interspersed with a few ballads and canzoni, arranged with a remarkable symmetry, to which Professor Charles Eliot Norton was the first to draw attention, chiefly written at the time to emphasize some mood of his changing passion. After each of these, in nearly every case, follows an explanation in prose, which is intended to make the thought and argument intelligible to those to whom the language of poetry was not familiar. The whole has a somewhat artificial air, in spite of its undoubted beauty; showing that Dante was still under the influence of the Dugentisti, many of whose conceits he reproduces. The book was probably completed by 1300. It was first printed by Sermartelli in Florence, 1576.

Besides the smaller poems contained in the Vita Nuova and Convivo there are a considerable number of canzoni, ballate and sonetti bearing the poet’s name. Of these many undoubtedly are genuine, others as undoubtedly spurious. Some which have been preserved under the name of Dante belong to Dante de Maliano, a poet of a harsher style; others which bear the name of Alighiero are referable to Jacopo or Piero, or to both Alighieros; others may be ascribed to Dante’s contemporaries and predecessors Cino da Pistoia and others. Those which are genuine secure Dante a place among lyrical poets scarcely if at all inferior to that of Petrarch. Most of these were printed in Sonetti e canzoni (Giunta, 1527). The best edition of the Canzoniere of Dante is that by Fraticelli published by Barbéa at Florence. His collection includes seventy-eight genuine poems, eight doubtful and fifty-four spurious. To these are added an Italian paraphrase of the seven penitential psalms in terza rima, and a similar paraphrase of the Credo, the seven sacraments, the ten commandments, the Lord’s Prayer and the Ave Maria.
The Latin treatise *De monarchia*, in three books, contains the mature statement of Dante's political ideas. In it he propounds the theory that the supremacy of the emperor is derived from the supremacy of the Roman people over the world, which was given to them direct from God. As the emperor is intended to assure their earthly happiness, so does their spiritual welfare depend upon the pope, to whom the emperor is to do honour as to the first-born of the Father. The date of its publication is almost universally admitted to be the time of the descent of Henry VII, into Italy, between 1310 and 1313, although its composition may have been in hand from a much earlier period. The book was first printed by Oporinus at Basel in 1559, and placed on the Index of forbidden books.

The treatise *De vulgari eloquentia*, in two books, also in Latin, is mentioned in the *Convito*. Its object was to establish the Italian language as a literary tongue, and to distinguish the noble or "courtly" speech which might become the property of the whole nation, at once a bond of internal unity and a line of demarcation against external nations, from the local dialects peculiar to different districts; and secondly to show prose writing founded on a literary language so established. The work was intended to be in four books, but only two are extant. The first of these deals with the language, the second with the style and with the composition of the canzone. The third was probably intended to continue this subject, and the fourth was destined to the laws of the ballata and sonetto. It contains much acute criticism of poetry and poetic diction. This work was first published in the Italian translation of Trissino at Vicenza in 1529. The original Latin was not published till 1577 at Paris by Jacopo Corbinelli, one of the Italians who were brought from Florence by Catherine de' Medici, from a MS. now preserved at Grenoble. The work was probably left unfinished in consequence of Dante's death.

Boccaccio mentions in his life of Dante that he wrote two eclogues in Latin in answer to Johannes de Virgilio, who invited him to come from Ravenna to Bologna and compose a great work in the Latin language. The most interesting passage in the work is that in the first poem, where he expresses his hope that when he has finished the three parts of his great poem his grey hairs may be crowned with laurel on the banks of the Arno. Although the Latin of these poems is superior to that of his prose works, we may feel thankful that Dante composed the great work of his life in his own vernacular. The versification, however, is good, and there are pleasant touches of gentle humour.

The *Eclogues* have been edited by Messrs. Rickert and Gardiner (Dante and Giovanni del Virgilio, London, 1902). A treatise *De aqua et terra* has come down to us, which Dante tells us was delivered at Mantua in January 1320 (perhaps 1321) as a solution of the question which was being at that time much discussed—whether in any place on the earth's surface water is higher than the earth. It was first published at Venice in 1508, by an ecclesiastic named Moncetti, from a MS. which he alleged to be in his possession, but which no one seems to have seen. Its genuineness is accordingly very doubtful; but Dr Moore has from internal evidence made out a very strong case for it.

The *Letters of Dante* are among the most important materials for his biography. Giovanni Villani mentions three as specially remarkable—one to the government of Florence, in which he complains of undervalued exile; another to the emperor Henry VII, when he lingered too long at the siege of Brescia; and a third to the Italian cardinals to urge them to the election of an Italian pope after the death of Clement V. The first of these letters has not come down to us, the two last are extant. Besides these we have one addressed to the cardinal de Prato, one to a Florentine friend refusing the base conditions of return from exile, one to the princes and lords of Italy to prepare them for the coming of Henry of Luxembourg, another to the Florentines reproaching them with the rejection of the emperor, and a long letter to Can Grande della Scala, containing directions for interpreting the *Divina Commedia*, with especial reference to the *Paradiso*. Of less importance are the letters to the nephews of Count Alessandro della Romana, to the marquis Morcello Malespina, to Cino da Pistoia and to Guido da Polenta. The genuineness of all the letters has at one time or another been impugned; but the more important are now generally accepted. They have been translated by Mr. C. S. Latham, ed. by Mr. G. R. Carpenter (Cambridge, Massachusetts and London, 1891).

Dante's reputation has passed through many vicissitudes, and much trouble has been spent by critics in comparing him with other poets of established fame. Read and commented upon with more admiration than intelligence in the Italian universities in the generation immediately succeeding his death, his name became obscured as the sun of the Renaissance rose higher towards its meridian. In the 16th century he was held inferior to Petrarch; in the 17th and first half of the 18th he was almost universally neglected. His fame is now fully vindicated. Translations and commentaries issue from every press in Europe and America, and many studies for separate points are appearing every year.

**Authorities.**—It would be impossible here to give anything like a complete account even of the editions of Dante's works; still more of the books which have been written to elucidate the *Commedia* as a whole, or particular points in it. The section "Dante" in the recent critical edition of the *Commedia*, published in three vols. in folio (1748—1750) by Francesco del Toppo, was included by Lord Vernon in *Le Prime Quattro Edizioni* (1856). Another Neapolitan edition, without printer's name, is dated 1477, and in the same year Wendelin of Siena published the first extant imprimatur of the *Commedia*. Milanesio, in 1478, published a translation of part of the *Commedia* with that known from the name of its editor as the *Nidobeatine*. In 1481 appeared the first Florentine edition (Niccolo a Lorenzo della Magna) with the commentary of Cristoforo Landino, and a series of commentaries assuring that of Baldini, which he has ascertained in different copies from two to twenty; a sumptuous and very carefully printed volume. Venice supplied most of the editions for many years to come. Altogether twelve have been issued by the end of the 18th century. The first produced three volumes (or perhaps four published in 1502) by Mr. William Warren Vernon, with the aid of Sir James Lacat. No greater boon has ever been offered to students of Dante. Another early annotator who must not be overlooked is Francesco da Buti di Pisa, who lectured in that city towards the close of
of the same century. His commentary, which served as the basis of Landino’s already mentioned, was first printed in Pisa in 1385. One more commentary deserves mention. During the council of Constance, John of Serravalle, bishop of Fermo, fell in with the English envoy in 1335. Although passages beautifully, and familiar traits were appended, they request compiled a voluminous exposition of the Commedia. This remained in MS. till recently, when it was printed in a costly form.

Translations.—Probably the first complete translation of Dante into English was by the Englishman John Villenes (1801). The following year Andreu Febrer produced a rendering into Catalan in 1751. Villagas published the Inferno in Spanish. The earliest French version is that of B. Granger (1507). Chaucer had adapted parts of the Commedia into the courtly style. But the first adequate rendering is the admirable blank verse of H. F. Cary (1816, 2nd ed. 1819), which has remained the standard translation, though others of merit, notably those of Pollock (1854) and Longfellow (1862). The translation was edited and annotated by H. F. Tozer (1887) in the terna rima; J. A. Carlyle (Inferno only, 1847). C. E. Norton (1891), and H. F. Tozer (1904), in prose, have since appeared. The best in German are those of Philalethes (the late King John of Saxony, 1867), and in Italian, Bianchi’s and Fratelli’s are still as good as any.

Other Aids.—For beginners no introduction is equal to the essay on Dante by the late Dean Church. Maria Rossetti’s Shadow of Dante (1891) is also very useful. J. A. Symonds’ Life of Dante (1862 and later issues). Dr Toynbee’s text (1900) follows the Oxford, with some modifications. The notes of Cary, Longfellow, Witte and “Philalethes,” appended to their several translations, are valuable. Scarrazzini’s comments on the Commedia (first published 1696) and its appendices, the 15th century. With a good deal of superficiality, and some superficial, erudition, it cannot be neglected by any one who wishes to study the poem thoroughly. An edition by A. J. Butler contains a prose version and notes. Of modern Italian editions, Bianchi’s and Fratelli’s are still as good as any.

DANTON, GEORGE JACQUES (1759-1794), one of the most conspicuous actors in the decisive episodes of the French Revolution, was born at Arcis-sur-Aube on the 26th of October 1759. His family was of respectable quality, though of very moderate means. They contrived to give him a good education, and he was launched in the career of an advocate at the Paris bar. When the Revolution broke out, it found Danton following his profession with apparent success, leading a cheerful domestic life, and nourishing his intelligence on good books. He first appears in the revolutionary storm as president of the popular club or assembly of the district in which he resided, he was the leader of the Cordeliers, so called from the circumstance that its meetings were held in the old convent of the order of the Cordeliers, just as the Jacobins derived their name from the refectory of the convent of the Jacobin Brothers. It is an odd coincidence that the old rivalries of Dominicans and Franciscans in the democratic movement inside the Catholic Church should be recalled by the names of the two factions in the democratic movement of a later century away from the church. The Cordeliers were from the first the centre of the popular principle in the French Revolution carried to its extreme point; they were the earliest to suspect the court of being irreconcilably hostile to freedom; and it was they who most vehemently proclaimed the need for root-and-branch measures. Danton’s robust, energetic and impetuous temperament made him the natural leader in such a quarter. We find no traces of his activity in the two great insurrectionary events of 1789—the fall of the Bastille, and the forcible removal of the court from Versailles to the Tuileries. In the spring of 1790 he urged the court to protest against the Marat. In the autumn we find him chosen to be the commander of the battalion of the national guard of his district. In the beginning of 1791 he was elected to the post of administrator of the department of Paris. This interval was for all France a barren period of doubt, fatigue, partial reaction and hope against hope. It was not until 1792 that Danton came into the prominence of a great revolutionary chief.

In the spring of the previous year (1791) Mirabeau had died, and with him had passed away the only man who was at all likely to prove a wise guide to the court. In June of that year the king and queen made a disastrous attempt to flee from their capital and their people. They were brought back once more to the Tuileries, which from that time forth they rightly looked upon more as a prison than a palace or a home. The popular exasperation was intense, and the constitutional leaders, of whom the foremost was Lafayette, became alarmed and lost their judgment. A bloody dispersal of a popular gathering, known afterwards as the massacre of the Champ-de-Mars (July 1791), kindled a flame of resentment against the court and the constitutional party which was never extinguished. The Constituent Assembly completed its indefatigable labors in September 1791. Then the elections took place to its successor, the short-lived Legislative Assembly. Danton was not elected to it, and his party was at this time only strong enough to procure for him a very subordinate position in the government of the Parisian municipality. Events, however, rapidly prepared a situation in which his influence became of supreme weight. Between January and August 1792 the want of sympathy between the aims of the popular assembly and the spirit of the king and the queen became daily more flagrant and beyond power of disguise. In April war was declared against Austria, and to the confusion and distraction caused by the immense civil and political changes of the past two years was now added the ferment and agitation of war with an enemy on the frontier. The distress felt by Paris for the court and its loyalty at length broke out in insurrection. On the memorable morning of the 10th of August 1792 the king and queen took refuge with the Legislative Assembly from the apprehended violence of the popular forces who were marching on the Tuileries. The share which Danton had in inspiring and directing this momentous rising is very obscure. Some look upon him as the head and centre of it. Apart from documents, support is given to this view by the fact that on the morrow of the fall of the monarchy Danton is found in the important post of minister of justice. This sudden rise from the subordinate office which he had held in the commune is a proof of the impression that his character had made on the insurrectionary party. To passionate fervor for the popular cause he added a certain broad steadfastness and an energetic practical judgment which are not always found in company with fervor. Even in those days, when so many men were so astonishing in their eloquence, Danton stands out as a master of commanding phrase. One of his fierce sayings has become a proverb: ‘Against Brunswick and the invaders, “il nous faut de l’audace, et encore de l’audace, et toujours de l’audace.”’—we must dare, and again dare, and for ever dare. The tones of his voice were loud and vibrant. As for his bodily presence, he had, to use his own account of it, the athletic shape and the stern physiognomy of the Liberty for which he was ready to die. Jove the Thunderer, the rebel Satan, a Titan, Sardanapalus, were names that friends or enemies borrowed to describe his men and port. He was
thought about as a coarser version of the great tribunal of the Constituent Assembly; he was called the Mirabeau of the sans-culottes, and Mirabeau of the markets.

In the executive government that was formed on the king's dethronement, this strong revolutionary figure found himself the colleague of the virtuous Roland and others of the Girondins. Their strength was speedily put to a terrible test. The alarming successes of the enemy on the frontier, and the surrender of two important fortresses, had engendered a natural panic in the capital. But in the breasts of some of the wild men whom the disorder of the time had brought to prominent place in the Paris commune this panic became murderously heated. Some hundreds of captives were barbarously murdered in the prisons. There has always been much dispute as to Danton's share in this dreadful transaction. At the time, it must be confessed, much odium on account of an imputed direction of the massacres fell to him. On the whole, however, he cannot be fairly convicted of any part in the plan. What he did was to make the best of the misdeed, with a kind of sombre acquiescence. He deserves credit for insisting against his colleagues that they should not flee from Paris, but should remain firm at their posts, doing what they could to rule the fierce stream that was raging around them.

The Convention and the National Convention took place in September, when the Legislative Assembly surrendered its authority. The Convention ruled France until October 1793. Danton was a member; resigning the ministry of justice, he took a foremost part in the deliberations and proceedings of the Convention, until his execution in April 1794. This short period of nineteen months was practically the life of Danton, so far as the world is concerned with him.

He took his seat in the high and remote benches which gave the name of the Mountain to the thoroughgoing revolutionists who sat there. He found himself side by side with Marat, whose exaggerations he never countenanced; with Robespierre, whom he did not esteem very highly, but whose imprecations were in many respects his own; with Camille Desmoulins and Philippeaux, who were his close friends and constant partisans. The foes of the Mountain were the group of the Girondins,—eloquent, dazzling, patriotic, but unable to apprehend the fearful nature of the crisis, too full of vanity and exclusive party-spirit, and too fastidious to be contained in a revolutionary revolution. The Girondins had despatched the people who had sent Danton to the Convention; and they insisted on seeing on his hands the blood of the prison massacres of September. Yet in fact Danton saw much more clearly than they saw how urgent it was to soothe the insurrectionary spirit, after it had done the work of abolition which to him, as to them too, seemed necessary and indispensable. Danton discerned what the Girondins lacked the political genius to see, that this control of Paris could only be wisely effected by men who sympathized with the vehemence and energy of Paris, and understood that this vehemence and energy made the only force to which the Convention could look in resisting the Germans on the north-east frontier, and the friends of reaction in the interior. "Paris," he said, "is the natural and constituted centre of free France. It is the centre of light. When Paris shall perish there will no longer be a republic."

Danton was among those who voted for the death of the king (January 1793). He had a conspicuous share in the creation of the famous revolutionary tribunal, his aim being to take the weapons away from that disorderly popular vengeance which had done such terrible work in September. When all executive power was conferred upon a committee of public safety, Danton had been one of the nine members of whom that body was originally composed. He was despatched on frequent missions from the Convention to the republican armies in Belgium, and wherever he went he infused new energy into the work of national liberation. He pressed forward the erection of a system of national education, and he was one of the legislative committee charged with the construction of a new system of government. He vainly tried to compose the furious dissensions between Girondins and Jacobins. The Girondins were irreconcilable, and made Danton the object of deadly attack. He was far too robust in character to lose himself in merely personal enmities, but by the middle of May (1793) he had made up his mind that the political suppression of the Girondins had become indispensable. The position of the country was most alarming. Dumouriez, the victor of Valmy and Jemmapes, had deserted. The French arms were suffering a series of checks and reverses. A royalist rebellion was gaining formidable dimensions in the west. Yet the Convention was wasting time and force in the vindictive recriminations of faction. There is no positive evidence that Danton directly instigated the insurrection of the 31st of May and the 2nd of June, which ended in the purge of the Convention and the proscription of the Girondins. He afterwards spoke of himself as in some sense the author of this revolution, because a little while before, stung by some trait of factious perversity in the Girondins, he had openly cried out in the midst of the Convention, that if he could only find a hundred men, they would resist the oppressive authority of the Girondin commission of twelve. At any rate, he certainly acquiesced in the violence of the commune, and he publicly gloried in the expulsion of the men who stood obstinately in the way of a vigorous and concentrated exertion of national power. Danton, unlike the Girondins, accepted the fury of the popular passion as indispensable to the work of deliverance.

Unlike Billaud Varenne or Hébert, or any other of the Terrorist party, he had no wish to use this frightful two-edged weapon more freely than was necessary. Danton, in short, had the instinct of the statesman. His object was to reconcile France with herself; to restore a society that, while emaciated and renewed in every part, should yet be stable; and above all to secure the independence of his country, both by a resolute defence against the invader, and by such a mixture of vigour with humanity as should reconcile the offended opinion of the rest of Europe. This, so far as we can make it out, was what was in his mind.

The position of the Mountain had now undergone a complete change. In the Constituent Assembly its members did not number more than 30 out of the 578 of the third estate. In the Legislative Assembly they had not been numerous, and none of their chiefs had a seat. In the Convention for the first nine months they had an incessant struggle for their very lives against the Girondins. They were now (June 1793) for the first time in power. They were in the ascendant. They were not easy, however, for men who had for many months been nourishing ideas on the ideas and stirred to the methods of opposition, all at once to develop the instincts of government. Actual power was in the hands of the two committees—that of public safety and of general security. Both were chosen out of the body of the Convention. The drama of the nine months between the expulsion of the Girondins and the execution of Danton turns upon the struggle of the committee to retain power—first, against the insurrectionary commune of Paris, and second, against the Convention, from which the committees derived an authority that was regularly renewed on the expiry of each short term.

Danton, immediately after the fall of the Girondins, had thrown himself with extraordinary energy into the work to be done. The first task in a great city so agitated by anarchical ferment had been to set up a strong central authority. In this genuinely political task Danton was prominent. He was not a member of the committee of public safety when that body was renewed in the shape that speedily made its name so redbound in all over the world. This was the result of a self-denying ordinance which he imposed upon himself. It was the wise and sound that the powers of the committee should be those of a dictator, and that it should have copious funds at its disposal. In order to keep himself clear of any personal suspicion, he announced his resolution not to belong to the body which he had thus done his best to make supreme in the state. His position during the autumn of 1793 was that of a powerful supporter and inspirer, from without, of the government which he had been foremost in setting up. Danton was not a great practical administrator and contriver, like Carnot, for instance. But he had the gift of raising in all who heard him an heroic spirit of patriotism and fiery devotion, and he had a clear eye and a cool judgment in the
tempestuous emergencies which arose in such appalling succession. His distinction was that he accepted the insurrectionary forces, instead of blindly denouncing them as the Girondins had done. After these forces had shaken down the throne, and then, by driving away the Girondins, had made room for a vigorous government, Danton perceived the expediency of making all haste to an orderly state. Energetic prosecution of the war, and gradual conciliation of civil hatreds, had been, as we have said, the two marks of his policy ever since the fall of the monarchy. The first of these objects was fulfilled abundantly, partly owing to the energy with which he called for the arming of the whole nation against its enemies. His whole mind was now given to the second of them. But the second of them, alas, was desperate.

It was to no purpose that, both in his own action and in the writings of Camille Desmoulins (Le Vieux Cordelier), of whom he was now and always the intimate and inspirer, he worked against the iniquities of the bad men, like Carrier and Collot d'Herbois, in the provinces, and against the severity of the revolutionary tribunal in Paris. The black flood could not at a word or in an hour subside from its storm-lashed fury. The commune of Paris was now composed of men like Hébert and Chaumette, to whom the restoration of any sort of political order was for the time indifferent. They wished to push destruction to limits which even the most ardent sympathizers with the Revolution condemn now, and which Danton condemned then, as extravagant and senseless. Those men were not politicians, they were fanatics; and Danton, who was every inch a politician, though of a vehe-

tment type, had as little in common with them as John Calvin of Geneva had with John of Leiden and the Münster Anabaptists. The committee watched Hébert and his followers uneasily for many weeks, less perhaps from disapproval of their excesses than from apprehensions of their hostility to the committee's own power. At length the party of the commune proposed to revolt against the Convention and the committees. Then the blow was struck, and the Hébertists were swiftly flung into prison, and thence under the knife of the guillotine (March 24th, 1794). The execution of the Hébertists was the first victory of the revolutionary government over the extreme insurrectionary party. But the committees had no intention to concede anything to their enemies on the other side. If they refused to follow the lead of the anarchists of the commune, they were none the more inclined to give way to the Dantonian policy of clemency. Indeed, such a course would have been their own instant and utter ruin. The Terror was not a policy that could be easily transformed. A new policy would have to be carried out by new men, and this meant the resumption of power by the Convention, and the death of the Terrorists. In Thermidor 1794 such a revolution did take place, with those very results. But in Germainal feeling was not ripe. The committees were still too strong to be overthrown. And Danton seems to have shown a singular heedlessness. Instead of striking by vigour in the Convention, he waited to be struck. In these later days a certain discouragement seems to have come over his spirit. His wife had died during his absence on one of the expeditions to the armies; he had, in that situation, at the request of his wife, been allowing domestic happiness to tempt him from the keen incessant vigilance proper to the politician in such a crisis. He must have known that he had enemies. When the Jacobin club was "purified" in the winter, Danton's name would have been struck out as a moderate if Robespierre had not defended him. The committees had deliberated on his arrest soon afterwards, and again it was Robespierre who resisted the proposal. Yet though he had been warned of the lightning that was thus playing round his head, Danton did not move. Either he felt himself powerless, or he rashly despised his enemies. At last Billaud Varenne, the most prominent spirit of the committee after Robespierre, succeeded in gaining Robespierre over to his designs against Danton. Robespierre was probably actuated by the motives of selfish policy which soon proved the greatest blunder of his life. The Convention, aided by Robespierre and the authority of the committee, assented with ignoble unanimity. On the 30th of March Danton, Desmoulins and others of the party were suddenly arrested. Danton displayed such vehemence before the revolutionary tribunal, that his enemies feared lest he should excite the crowd in his favour. The Convention, in one of its worst fits of confidence, as the prosecution made by St Just that, if a prisoner showed want of respect for justice, the tribunal might pronounce sentence without further delay. Danton was at once condemned, and led, in company with fourteen others, including Camille Desmoulins, to the guillotine (April 5th, 1794). "I leave it all in a frightful welter," he said; "not a man of them has an idea of government. Robespierre will follow me; he is dragged down by me. Ah, better be a poor fisherman than meddle with the government of men!"

Events went as Danton foresaw. The committees presently came to quarrel with the pretensions of Robespierre. Three months after Danton, Robespierre fell. His assent to the execution of Danton had deprived him of the single great force that might have supported him against the committee. The man who had "saved France from Brunswick" might perhaps have saved her from the White reaction of 1794.

BIBLIOGRAPHY.—Sources for the life of Danton abound in the national archives and in the columns of the Moniteur. His Oeuvres were published by A. Vermorel (Paris, 1866), and his speeches are included in H. Morse Stephens' Principal Speeches of the Statesmen and Orators of the French Revolution (vol. ii., Oxford, 1852); cf. F. V. Aulard, "Danton et ses Oeuvres de deux siècles" (Paris, 1901), and "Robespierrisme et la politique contemporaine" (Paris, 1880); A. H. Beesly, Life of Danton (1899, new ed. 1906); H. Belloc, Danton (1906). There is a short "Life of Danton" in Morse Stephens' Principal Speeches, cited above. See also C. F. Warwick, Danton and the French Revolution (1909).

DANUBE (Ger. Donau, Hungarian Duna, Rumanian Dunarea, Lat. Danubius or Danuvius, and in the lower part of its course Ister), the most important river of Europe as regards the volume of its outflow, but inferior to the Volga in length and in the area of its drainage. It originates at Donaueschingen in the Black Forest, where two mountain streams, the Brigach and the Brege, together with a third stream from the Palace Gärden, unite at an elevation of 1287 ft. above the sea to form the Danube so called. From this point it runs in an easterly direction until it falls into the Black Sea some 1750 m. from its source, being the only European river of importance with a course from west to east. Its basin, which comprises a territory of nearly 300,000 sq. m., is bounded by the Black Forest, some of the minor Alpine ranges, the Bohemian Forest and the Carpathian Mountains on the north, and by the Alps and the Balkan range on the south. From the point where the Danube becomes navigable, i.e. at its junction with the Iller at Ulm (1305 ft. above sea level), it is fed by at least 300 tributaries, the principal of which on the right bank are the Inn, the Drave and the Save; while on the left bank are the Theiss or Tisza, the Olt, the Sereth and the Pruth. These seven rivers have a total length of 2920 m. and drain one half of the basin of the Danube.

The course of this mighty river is rich in historical and political associations. For a long period it formed the frontier of the Roman empire; near Eining (above Regensburg) was the ancient Abusina, which for nearly five centuries was the chief Roman outpost against the northern barbarians. Traces of Trajan's wall still exist between that point and Wiesbaden, while another line of fortifications bearing the same emperor's name are found in the Dobrudja between Cernavoda (on the lower Danube) and Constantza. At intervening points are still found many notable Roman remains, such as Trajan's road, a marvellous work on the
right bank of the river in the rocky Kazan defle (separating the
Balkans on the south from the Carpathians on the north), where
a contemporary commemorative tableau is still conspicuously
visible. At Turnu Severin below the end of this famous gorge
are the remnants of a solid masonry bridge constructed by
the same emperor at the period of his Dacian conquests. But since
Roman days the central Danube has never formed the boundary
of a state; on the contrary it became the route followed from
east to west by successive hordes of barbarians—Huns,
Avars, Slavs, Magyars and Turks; while the Franks under
Charlemagne, the Bavarians and the Crusaders all marched in
the opposite direction towards the east. In more modern days
its banks were the scenes of many bloody battles during the
Napoleonic Wars. Still more recently it has become the great
highway of commerce for central Europe. It has been pointed
out by J. G. Kohl (Austria and the Danube, London, 1844) and
others that, in consequence of the Danube having been in
constant use as the line of passage of migratory hostile tribes, it
nowhere forms the boundary between two states from Orsova
upwards, and thus it traverses as a central artery Württemberg,
Bavaria, Austria and Hungary, while on the other hand various
tributaries both north and south, which formed serious obstacles
to the march of armies, have become lines of separation between
different states. Thus Hungary is separated from Austria by the
rivers March and Leitha; the river Enns, for a considerable
period the extreme western boundary of the Magyar kingdom,
still separates Upper and Lower Austria; the Inn and the
Salzach divide Austria from Bavaria, and farther west the Iller
separates Bavaria from Württemberg.

The Danube after leaving Donaueschingen flows south-east
in the direction of Lake Constance, and below Immendingen a
considerable quantity of its waters escapes through
subterranean fissures to the river Ach in the Rhine basin.
At Gutmadingen it turns to the north-east, which
general direction, although with many windings, it maintains as far
as Passau. To lighten it contracts and the hills crowd close
to the banks, while ruins of castles crown almost every possible
summit. The scenery is wild and beautiful until the river passes
Sigmaringen. At Ulm, where the river leaves Württemberg
and enters Bavaria, it is joined by a large tributary, the Iller,
and from this point becomes navigable downstream for specially
constructed boats carrying 100 tons of merchandise. It is here
some 78 yds. in breadth, with an average depth of 3 ft. 6 in.
Continuing its north-easterly course it passes through Bavaria,
gradually widening its channel first at Steppenh, then at Ingolstäd,
but finally narrowing again until it reaches Regensburg
(height 949 ft.). At this point it changes its direction to the south-
east, and passing along the southern slopes of the Bavarian
Forest enters Austria at Passau (height 800 ft.). In its passage
through Bavaria it receives several important affluents on both
banks, notably on the right the Alpine rivers Lech, Isar and Inn.
the last of which at the junction near Passau exceeds in volume
the waters of the Danube.

From Passau the Danube flows through Austria for a distance
of 233 m. Closed in by mountains it flows past Linz in an
unbroken stream—below, it expands and divides into many arms
until it reaches the famous whirlpool near Grein where its waters
unite and flow on in one channel for 40 m., through mountains
and narrow passes. Beyond Krems it again divides, forming
arms and islands beyond Vienna. The Danube between Linz and
Vienna is renowned not only for its picturesque beauty but for
the numerous medieval and modern buildings of historical and archaeological interest which crown its banks. The splendid Benedictine
monastery of Melk and the ruins of Dürrenstein, the prison of
Richard Cœur de Lion, are among the most interesting.

After passing Vienna and the Marchfeld, the Danube (here
316 yds. wide and 429 ft. above sea-level) passes through a defile
formed by the lower spurs of the Alps and the Carpathians and
enters Hungary at the ruined castle of Theben a little above
Pressburg, the old Magyar capital, after leaving which the river
passes through the Hungarian plains, receiving some affluents
on both sides. It divides into three channels, forming several
islands. After passing the fortress of Komárom it loses its easterly
course at Vác (Waitzen), and flows nearly due south (for 230 m.
down to its junction with the Drave (8 ft. above sea-level),
passing in its course Budapest, the capital of Hungary, and
further on Mohács. Below Mohács the Franz Josef canal
connects the Danube with the Theiss. After its junction with the
Save the Danube follows a south-easterly direction for 200 m.
until it is joined on the right bank of the Drave at Belgrade,
above which it receives on the left bank the Theiss or Tisza,
the largest of its Hungarian affluents. From Belgrade the Danube
separates Hungary from Servia. It flows eastward until it has
passed through the stupendous Kazan defle, in which its waters
(at Semlin 1700 yds. wide and 40 ft. deep) are hemmed in by
precipitous rocks to a width of only 162 yds., with a depth of
150 ft. and a tremendous current. Emerging, above Orsova,
at a height of 42 ft. above sea-level, it opens to nearly a mile in
width and, turning south-eastwards, is again narrowed by its
last defle, the Iron Gates, where it passes over the Frigirada
rock. The course of the river through Hungary, from Pressburg
to Orsova, is some 600 m.

The river now flows south, separating Servia from Rumunia
down to its junction with the Timok, after which as far as
Siliстра, a distance of 284 m., it separates Rumunia from
Bulgaria. The north bank is mostly flat and marshy, whereas
the Bulgarian bank is almost continuously crowned by low
heights on which are built the considerable towns of Vinid
(Widdin), Lom Palanka, Ruschuk and Silistria, all memorable
names in Turkish-Russian wars. From Silistria the river flows
through Rumunian territory and after passing Cernavoda, where
it is crossed by a modern railway bridge, it reaches (left bank)
the important commercial ports of Braila and Galatz. A few
miles east of Galatz the Pruth enters on the left bank, which
is thenceforward Russian territory. The Danube flows in a single
channel from Galatz for 30 m. to the Ismail Chatal (or fork),
where it breaks up into the several branches of the delta. The
Kilia branch from this point flows to the north-east past the
towns of Ismail and Kilia, and 17 m. below the latter breaks up
into another delta discharging by seven channels into the Black
Sea. The Tulcea branch flows south-east from the Ismail
Chatal, and 7 m. below the town of Tulcea separates into two
branches. The St George's branch, holding a general, though
winding, course to the south-east, discharges by two channels
into the sea; and the Sulina branch, taking an easterly direction,
emerges into the Black Sea 20 m. south of the Ochakov mouth
of the Kilia, and 20 m. north of the Kedrilles mouth of the St George.

In 1857 the proportion of discharge by the three branches
of the Danube was Sulina 7%, St George's 30% and Kilia 63%;
but in 1905 the relative proportions had altered to Sulina 9%,
St George's 24% and Kilia 67%. The average outflow by the
two mouths combined is 236,432 cub. ft. per second. The
delta enclosed between the Kilia and St George's branches, about
1000 sq. m. in area, mainly consists of one large marsh covered
with reeds, and intersected by channels, relieved in places by
isolated elevations covered with oak, beech and willows, many
of them marking the ancient coast-line. On the eastern side
of the Kilia delta the coast-line is constantly advancing and
the sea becoming shallower, owing to the enormous amount of
solid deposits brought down by the river. In time of ordinaryflood the Kilia branch with its numerous mouths pours into the
sea some 3000 cub. ft. of sand and mud per minute. Its effects
are felt as far south as Sulina, and tend to necessitate the farther
extension into the sea of the guiding piers of that port.

In the course of the 19th century, more especially during its
latter half, much was done to render the Danube more available
as a means of communication. In 1816 Austria and
Bavaria made arrangements for the common utilization of
the upper portion of the river, and since then both
governments have been liberal in expenditure on its
improvement. In 1844 the Ludwigs Canal was constructed by King Louis
of Bavaria. It is 116 m. in length and 7 ft. in depth, and
connects the Danube at Kelheim (half way between Ulm and Passau) with
the Rhine at Mainz by means of the rivers Altmühl, Regnitz and
Main. Various other projects exist, one for the connexion of the Danube (near Vienna) with the river Oder at Oderberg, another for a canal from the Danube to the Moldau at Budweis, 25 m. in length, which owing to the regularization of the Moldau is the last uncompleted link of a navigable channel 1875 m. in length between Sulina and Hamburg at the mouths of the Danube and the Elbe respectively. There also exist other schemes for joining the Danube with the rivers Neckar and Theiss, and also for connecting the Oder Canal with the Vistula and the Dniester. Between Ulm and Vienna, a distance of 629 m., works of rectification have been numerous and have greatly improved the navigability of the river. The draining of the Donau-moos between Neuburg and Ingolstadt, commenced in 1791, was successfully completed about 1835; and in 1853 the removal of the rocks which obstructed the river below Grein was finally achieved; while at Vienna itself the whole mass of the Danube was conducted nearer the town for a distance of nearly 2 m. through an artificial channel 10 m. in length and 330 yds. in width, with a depth of about 12 ft., and at a cost with subsidiary works of over three millions sterling. The work, begun in 1866, involved the removal of 12,000,000 cub. metres of sand and gravel, and proved a great success, not only amply realizing its principal object, the protection of Vienna from disastrous inundations, but also improving the navigability of the river in that portion of its course. The Hungarian government also, towards the latter half of the 19th century, expended vast sums at Budapest for the improvement of navigation and the protection of the town from inundation, and in the regularization of the Danube down to Orsova.

In prehistoric times a great part of the plains of Hungary formed a large inland sea, which ultimately burst its bounds, whereupon the Danube forced its way through the Carpathians at the Kazan defile. Much of what then formed the bottom of this sea consisted until modern times of marshes and waste lands lying in the vicinity of its numerous rivers. The problem of draining and utilizing these lands was not the only difficulty to be surmounted by the Hungarian engineers; the requirements of navigation and the necessity in winter of preventing the formation of large ice-fields, such as caused the disastrous floods at Budapest in 1835, had also to be considered. In carrying out these works the Hungarian government between 1867 and 1895 spent seven millions sterling, and a further expenditure of three and a half millions was provided for up to 1907. At Budapest, where the formation of ice-fields at the upper entrance of the two side arms of the Danube—the Promontor on the north, 20 m. in length, and the Soroksar, 35 m. wide—caused the inundation alluded to, the latter branch has been artificially blocked and the whole of the Danube now flows through Budapest in a single channel. For the first section of 60 m. after entering Hungary, the bed of the river, here surcharged with gravel, was constantly changing its course. It has been regularized throughout, the width of the stream varying from 320 to 400 yds. In the second section from Gönöd to Paks, 164 m. in length, the river had a tendency to form islands and sand-banks—its width now varies uniformly from 455 to 487 yds. The third section of 113 m., from Paks to the mouth of the Drave, differed from the others and made innumerable twists and curves. No fewer than seventeen cuttings have been made, reducing the original course of the river by 75 m. The fourth section, 217 m. in length, from the Drave to Old Moldova, resembles in its characteristics the second section and has been similarly treated. Cuttings have also been made where necessary, and the widths of the channel are 487 yds. to the mouth of the Theiss, 650 between that point and the Save, and lower down 760 yds. In the fifth and last section from Old Moldova to Orsova and the Iron Gates the river is encased by mountains and rocky banks, and the obstacles to navigation are rocks and whirlpools.

Article VI. of the treaty of London (1871) authorized the powers which possess the shores of this part of the Danube to come to an understanding with the view of removing these impediments, and to have the right of levying a provisional tax on vessels of every flag which may henceforth benefit thereby until the extinction of the debt contracted for the execution of the works. As the riverain powers could not come to an agreement on the subject, the great powers at the congress of Berlin (1878) entrusted to Austria-Hungary the execution of the works in question. Austria-Hungary subsequently conferred its rights on Hungary, by which country the works were carried out at a cost of about one and a half millions sterling.

The principal obstructions between Old Moldova and Turnu Severin were the Stenka Rapids, the Kozla Dobjke Rapids, the Greben section and the Iron Gates. At the first named there was a bank of rocks, some of them dry at low water, extending almost across the river (985 yds. wide). The fall of the river bed is small, but the length of the rapid is 1100 yds. The Kozla Dobjke, 9 m. below the Stenka Rapids, extend also for 1100 yds., with a fall of 1 in 1000, where two banks of rocks cause a sudden alternation in the direction of the current. The river is here only 170 to 330 yds. in width. Six miles farther on is the Greben section, the most difficult part of the works of improvement. A spur of the Greben mountains runs out below two shoals where the river suddenly narrows to 300 yds. at low water, but presently widens to 13 m. Seven miles lower down are the Jucz Rapids, where the river-bed has a fall of 1 in 433. At the Iron Gates, 34 m. below the Greben, the Prigrada rocky bank nearly blocked the river at the point where it widens out after leaving the Kazan defile. The general object of the works was to obtain a navigable depth at all seasons of 2 m. (6-6 ft.) on the principal portion of the river above Orsova, and a depth of 3 m. (9-8 ft.) below that town. To effect this at Stenka, Kozla Dobjke, Isalz and Tachtalia, channels 66 yds. wide had to be cut in the solid rock to a depth of 6 ft. 6 in. below low water. The point of the Greben spur had to be entirely removed for a distance of 167 yds. back from its original face. Below the Greben point a training wall 7 to 9 ft. high, 10 ft. at top and nearly 4 m. in length, has been built along the Servian shore in order to confine the river in a narrow channel. At Jucz another similar channel had to be cut and a training wall built. At the Iron Gates a channel 80 yds. wide, nearly 2000 yds. in length and 10 ft. deep (in the immediate vicinity of traces of an old Roman canal) had to be cut on the Servian side of the river through solid rock. Training walls have been built on either side of the channel to confine the water so as to raise its level; that on the right bank having a width of 19 ft. 6 in. at top, and serving as a tow-path; that on the left being 13 ft. in width. These training walls are built of stone with flat revetments to protect them against ice. These formidable and expensive works have not altogether realized the expectations great Britain, Prussia, Russia, Sardinia and Turkey were each represented by one delegate "to designate and cause be executed the works necessary below Isaktha" to clear the mouths of the Danube as well as the neighbouring parts of the sea, from
the sands and other impediments which obstructed them, in order
to put that part of the river and the said parts of the sea in the
best state for navigation.”

In Art. XVIII of the same treaty it was anticipated that the
European commission would have finished the works described
within the period of two years, when it was to be dissolved and its
powers taken over by a Riverain commission to be established
under the same treaty; but this commission has never come into
existence. Extended by short periods up to 1871, the
powers of the European commission were then prolonged under
the treaty of London for twelve years. At the congress of Berlin
in 1878 its jurisdiction was extended from Isakcea to Galatz
(26 m.), and it was decided that the commission, in which
Rumania was henceforward to be represented by a delegate,
should exercise its powers in complete independence of the
territorial authority. By the treaty of London of 1883 the
jurisdiction of the commission was extended from Galatz to Braila
and its powers were prolonged for twenty-one years (i.e. till
the 24th of April 1904), after which its existence was to continue
by tacit prolongation for successive terms of three years unless
at any time the high contracting powers should propose any modifica-
tion in its constitution or attributes. It was also decided that the
European commission should no longer exercise any effective
control over that portion of the Kilia branch of which the two
banks belonged to one of the riverain powers (Russia and
Rumania), while as regards that portion of it which separated the
two countries, control was to be exercised by the Russian and
Rumanian delegates on the European commission. Russia was
also authorized to levy tolls intended to cover the expenses of
any works of improvement that might be undertaken by her.

Art. VII. of the same treaty declared that the regulations for
navigation, river police, and superintendence drawn up on the
2nd of June 1882 by the European commission, assisted by the
delegates of Servia and Bulgaria, should be made applicable to
that part of the Danube situated between the Iron Gates and
Braila. In consequence of Rumania’s opposition, the proposed
Commission Mixte was never formed, and these regulations have
never been put in force. As regards the extension of the powers
of the European commission to Braila, 11 m. above Galatz, and
at the head of the maritime navigation, a tacit understanding has
been arrived at, under which questions concerning navigation
proper come under the jurisdiction of the commission, while
the police of the ports remains in the hands of the Rumanian
authorities.

Sir Charles Hartley, who was chief engineer of the commission
from 1856 to 1907, in a paper contributed to the Institution of
Civil Engineers in 1873 (vol. xxxvi.), gave the following graphic
description of the state of the Sulina mouth when the commission
entered on its labours in 1856:

"The entrance to the Sulina branch was a wide open seaboard
strewn with wrecks, the hulls and masts of which, sticking out of
the submerged sandbanks, gave to mariners the only guide when the
deepest channel was to be found. The depth of the channel varied
from 7 to 11 ft., and was rarely more than 9 ft.

The site was occupied by wide quays extending several miles
in length. The quays were more than three-fourths loaded with either the whole
or part of their cargoes from lighters in the Sulina roadstead, where,
lying off a lee shore, they were frequently exposed to the greatest
danger. Shipwrecks were of common occurrence, and occasionally
the men of the ship were lost. One dark winter night in
1855, during a terrific gale, 24 sailing ships and 60 lighters went
ashore off the mouth and upwards of 300 persons perished."

The state of affairs in the river was not much better than at the
Sulina mouth. Of the three arms of the Danube, the Kilia, the
Sulina and the St George, the central or Sulina branch, owing to its
greater depth of water over the bar, being from time immemorial
been the principal waterway for sea-going vessels; its average
depth throughout its course, which could not always be counted
on, was 8 ft., but it contained numerous shoals where vessels had
to lighten, so that cargo had often to be shifted several times in
the voyage down the river. It also contained numerous bends
and sharp curves, sources of the greatest difficulty to navigation.

The commission fixed its seat at Galatz. Provisional works of
improvement were begun almost immediately at the mouth of
the Sulina branch of the Danube, but two years were spent in
discussing the relative claims to adoption of the Kilia, the Sulina
and the St George’s mouths. Unable to agree, the delegates
referred the question to their respective governments, and
a technical commission appointed by France, England, Prussia
and Sardinia met at Paris and decided unanimously in favour of St
George’s; but recommended, instead of the embarkment of the
natural channel, the formation of an artificial canal 17 ft. in
depth closed by sluices at its junction with the river, and reaching
the sea at some distance from the natural embouchure. The
choice of St George’s was made by this commission and approved
at Galatz in December 1858, and six of the seven representatives
voted for its canalization; but owing to various political and
financial considerations, it was ultimately decided to do nothing
in the meantime than render permanent and effective
the provisional works already in progress at the Sulina mouth.
These consisted of two piers forming a seaward prolongation of
the fluvial channel, begun in 1858 and completed in 1861.
The northern pier had a length of 4631 ft., the southern of 3000,
and the depth of the water in which they were built varied from
6 to 20 ft. At the commencement of the works the depth of the
channel was only 9 ft. but by their completion it had increased
to 10 ft. The works designed and constructed by Sir Charles
Hartley had in fact proved so successful that nothing more was
ever heard of the St George’s project. In 1865 a new lighthouse
was erected at the end of the north pier. The value of these
early works of the commission is shown by the fact that 2928
vessels navigating the lower Danube in 1855-36 were wrecked,
while of 2676 in 1865 only 7 were wrecked. In 1871 it was
found expedient to lengthen the piers seaward, and in 1876 the
south jetty was prolonged, so as to bring its end exactly opposite
the lighthouse on the north pier. This resulted in an increase of
the depth to 20½ ft., and for fifteen years, from 1879 to 1895, this
depth remained constant without the aid of dredging. In 1894,
owing to the constantly increasing size of vessels frequenting the
Danube, it was found necessary to deepen the entrance still
further, and to construct two parallel piers between the main
jetties, reducing the breadth of the river to 500 ft., and thereby
increasing the scour. There is now a continuous channel 24 ft.
in depth, 5200 ft. in length, and 300 ft. in width between the piers,
and 600 ft. outside the extremities of the piers, until deep water
is reached in the open sea. This depth is only maintained by
constant dredging. The engineers of the commission have been
unequivocally successful in maintaining the Sulina branch of the river.
Its original length of 45 m. from St George’s branch to the
open sea was impeded at the commencement of the improvement works
by eleven bents, each with a radius of less than 1000 ft., besides
numerous others of somewhat larger radius, and its bed was
encumbered by ten shifting shoals, varying from 8 to 13 ft. in
depth at low water. By means of a series of training walls,
by groynes thrown out from the banks, by revetments of the
banks, and by dredging, all done with the view of narrowing the
river, a minimum depth of 11 ft. was attained in 1865, and 13 ft.
in 1871. In 1880 the needs of commerce and the increased size
of steamers frequenting the river necessitated the construction of
a new entrance from the St George’s branch. This work, designed
in 1857, but unexecuted during a quarter of a century, owing to
insufficiency of funds, was completed in 1882; and in
1886, after other comparatively short cuttings had been made
to get rid of difficult bends and further to deepen the channel
without having to resort to dredgers, the desired minimum depth of
15 ft. was attained. Since that date a series of new cuttings

---

1 Sir Charles Hartley became consulting engineer in 1872, when he
was succeeded as resident engineer by Mr Charles Kühl, C.E., C.M.G.
To those two gentlemen is mainly due the conspicuous success of the
engineering works.
DANVERS—DANVILLE

has been made. These have shorted the length of the Sulina canal by 11 nautical m., eliminated all the difficult bends and shoals, and provided an almost straight waterway 34 m. in length from Sulina to St George's Chatal, with a minimum depth of 20 ft. when the river is at its lowest.

In the early days of the commission, i.e. from 1857 to 1860, the money spent on the works of improvement, amounting to about £150,000, was advanced as a loan by the then territorial power, Turkey; but in 1860 the commission began to levy taxes on vessels frequenting the river, and since then has repaid its debt to the Turkish government, as well as various loans for short periods, and a larger one of £120,000 guaranteed by the powers, and raised in 1868, mainly through the energy of the British commissioner, Sir John Stokes. This last loan was paid off in 1882 and the commission became free from debt in 1887. It has now an average annual income of about £80,000 derived from taxes paid by ships when leaving the river. The normal annual expenditure amounts to about £36,000, while £24,000 is generally allotted to extraordinary works, such as new cuttings, &c. Between 1857 and 1903 a sum of about one and three quarter million dollars was spent on engineering works, including the construction of quays, lighthouses, works, harbors and buildings, &c. Sulina from being a collection of mud boulders has developed into a town with 5000 inhabitants; a well-found hospital has been established where all merchant sailors receive gratuitous treatment; lighthouses, quays, floating elevators and an efficient pilot service all combine to make it a first-class port.

The result of all the combined works for the rectification of the Danube is that from Sulina up to Braila the river is navigable for sea-going vessels up to 4000 tons register, from Braila to Turnu Severin it is open for sea-going vessels up to 600 tons, and for flat barges of from 1500 to 2000 tons capacity. From Turnu Severin to Orsova navigation is confined to river steamers, tugs and barges drawing 6 ft. of water. Thence to Vienna the draught is limited to 5 ft., and from Vienna to Regensburg to a somewhat lower figure. Barges of 600 tons register can be towed from the lower Danube to Regensburg. Here petroleum tanks have been constructed for the storage of Rumanian petroleum, the first consignment of which in 1868, conveyed in tank boats, took six weeks on the voyage up from Giurigevo. The principal navigation is in vessels engaged in engineering works, including the construction of quays, lighthouses, works, harbors and buildings, &c.

The Danube is still an important waterway for trade and industry. The river is navigable for sea-going vessels up to 4000 tons register, from Braila to Turnu Severin it is open for sea-going vessels up to 600 tons, and for flat barges of from 1500 to 2000 tons capacity. From Turnu Severin to Orsova navigation is confined to river steamers, tugs and barges drawing 6 ft. of water. of whom 1435 were foreign-born; (1930) 27,871. Danville is served by the Chicago & Eastern Illinois (whose shops are here), the Wabash, the Chicago, Indiana & Southern, and the Cleveland, Cincinnati, Chicago & St Louis railways, and has several interurban lines. There are three public parks (Lincoln, Douglas and Ellsworth), a Carnegie library (1883), and a national home for disabled volunteer soldiers (opened in 1868). Situated in the vicinity of an extensive coalfield (the Grape Creek district), Danville has a large trade in coal; it has also several manufacturing establishments engaged principally in the construction and repair of railway cars, and in the manufacture of bricks, foundry products, glass, carriages, flour and hominy. The value of the factory products of the city in 1905 was $3,304,120, an increase of 72.7% since 1900. Danville was first settled about 1830 and was first incorporated in 1839; in 1874 it was chartered as a city under the general state law of 1872 for the incorporation of municipalities. It annexed Vermillion Heights in 1905, South Danville (pop. in 1900, 808) in 1906, and Germantown (pop. in 1900, 1782) and Roselawn in 1907.

**Danville**, a city and the county-seat of Boyle county, Kentucky, U.S.A., 113 m. by W. of Cincinnati. Pop. (1800) 3766; (1850) 4285; (1890) 5420. The city is served by the Southern and the Cincinnati Southern railways, the latter connecting at Junction city (4 m. S.) with the Louisville & Nashville railway. Danville is an attractive city, situated in the S.E. part of the fertile Blue Grass region of Kentucky. In McDowell Park there is a monument to the memory of Dr Ephraim McDowell (1778-1835) who after 1795 lived in Danville. Dr McDowell is famous for having performed in 1809 the first entirely successful operation for the removal of an ovarian tumour. Danville is the seat of several educational institutions, the most important of which is the Central University of Kentucky (Presbyterian), founded in 1801 by the consolidation of Centre College (opened at Danville in 1823), and the Central University (opened at Richmond, Ky., in 1874). The law school also is in Danville. The classical, scientific and literary department of the present university is still known as Centre College; the medical and dental departments are in Louisville, and the university maintains a preparatory school, the Centre College academy, at Danville. In 1898 the university had 87 instructors and 660 students. Other institutions at Danville are Caldwell College for women (1860; Presbyterian), and the Kentucky state institution for deaf mutes (1823). The Transylvania seminary was opened here in 1785, but four years later was removed to Lexington (q.v.), and a Presbyterian theological seminary was founded here in 1833, but was merged with the Louisville theological seminary (known after 1902 as the Presbyterian Theological Seminary of Kentucky) in 1910. The municipality owns and operates its water-works and power plant. From its first settlers in 1780 until 1781 until the admission of Kentucky into the Union in 1792 Danville was an important political centre. There was an influential political club here from 1786 to 1790, and here, too, sat the conventional assemblies—nine in all—which asked for a separation from Virginia, discussed the proposed conditions of separation from that commonwealth, framed the first state constitution, and chose Frankfort as the capital. Danville was incorporated in 1789. It was the birthplace of James G. Birney and of Theodore O'Hara.

**Danville**, a borough and the county-seat of Montour county, Pennsylvania, U.S.A., on the N. branch of the Susquehanna river, about 65 m. N. by E. of Harrisburg. Pop. (1890) 7998; (1900) 8042, of whom 771 were foreign-born; (1910 census) 7577. It is served by the Delaware, Lackawanna & Western, and the Philadelphia & Reading railways, and by electric railway to Bloomsburg. The borough is built on an elevated bank of the river at the base of Montour Hill, where the narrow valley appears to be shut in on every side by hills; the river is spanned by a steel bridge, built in 1905. Iron, coal and limestone abound in the vicinity, and the borough has large manufactories of steel works and furnaces, and of iron and steel, in one of which in 1845 a "T"-rail, probably the first in America, was rolled. It is the seat of a state hospital for the insane (established in 1868). The water-works and electric light plant are owned and operated by the municipality. A settlement was founded here about 1776 by Captain William Montgomery and his son Daniel; and a town was laid out in 1792 and called Dan's Town until the present name was adopted a few years later. Growth was slow until the discovery of iron ore on Montour Ridge, followed in 1832 by the completion of the N. branch of the Pennsylvania Canal, which runs through the centre of the borough. Danville was incorporated in 1849.

**Danville**, a city in Pittsylvania county, Virginia, U.S.A., on the Dan river about 140 m. (by rail) S.W. of Richmond. Pop. (1800) 10,505; (1900) 16,520; (1910) 19,020. It is on the main line of the Southern railway, and is the terminus of branches to Richmond and Norfolk; it is also served by the Danville & Western railway, a road (75 m. long) connecting with Stuart, Va., and controlled by the Southern, though operated independently. The city is built on high ground above the river. It has a city hall, a general hospital, a Masonic temple, and a number of educational institutions, including the Roanoke College (1860; Baptist), for young women; the Randolph-Macon Institute (1877; Methodist Episcopal, South), for girls; and a commercial college. The river furnishes valuable water-power, which is utilised by the city's manufactories (value of product in 1900, 1381,000, of which only $3,600,764 was "factory" product; in 1890 the "factory" product was valued at $4,774,818), including cotton mills—in 1905 Danville ranked first among the cities of the state in the value of cotton goods produced—a number of tobacco factories, furniture and overall factories, and flour and knitting mills. The city is a jobbing centre and wholesale market for a considerable area in southern Virginia and northern North Carolina, and is probably the largest loose-leaf tobacco market in the country, selling about 40,000,000 lb annually. In the industrial suburb of Schoolfield, which in 1900 had a population of about 3000, there is a large textile mill. The city owns and operates its water-supply system (with an excellent filtration plant installed in 1904) and its gas and electric lighting plants. Danville was settled about 1770, was first incorporated as a town in 1792, and became a city in 1833; it is politically independent of Pittsylvania county. To Danville, after the evacuation of Richmond on the 2nd of April 1865, the archives of the Confederacy were carried, and here President Jefferson Davis paused for a few days in his flight southward.

**Danzig**, or **Danzig** (Polish Gdańsk), a strong maritime fortress and seaport of Germany, capital of the province of West Prussia, on the left bank of the western arm of the Vistula, 41 m. S. of its entrance, at Neufahrwasser, into the Baltic, 253 m. N.E. from Berlin by rail. Pop. (1885) 114,805; (1905) 129,688. The city is traversed by two branches of the Motlawa, a small tributary of the Vistula, dredged to a depth of 15 ft., thus enabling large vessels to reach the wharves of the inner town. The strong fortifications which, with ramparts, bastions and wet ditches, formerly entirely surrounded the city, were removed on the north and west sides in 1805-1806, the trenches filled in, and the area thus freed laid out on a spacious plan. One portion, acquired by the municipality, has been turned into promenades and gardens, the Steffens Park, outside the Oliwaer Tor, fifty acres in extent, occupying the north-western corner. The remainder of the massive defences remain, with twenty bastions, in the hands of the military authorities; the works for laying the surrounding country under water on the eastern side have been modernised, and the western side defended by a cordon of forts crowning the hills and extending down to the port of Neufahrwasser.

Danzig almost alone of larger German cities still preserves its picturesque medieval aspect. The grand old patrician houses of the days of its Hanseatic glory, with their lofty and often elaborately ornamented gable-fronts, with their balconies and windows, are the delight of the visitor to the town. Only one ancient feature is rapidly disappearing—owing to the exigencies of street traffic—the stone terraces close to the entrance doors and abutting on the street. Of its old gates the Grohe Tor, modelled after a Roman triumphal arch, is a remarkable monumental erection of the 16th
DAPHLA HILLS—DAPHNEPHORIA

The Ethnology of Bengal considers the Daphlas to be closely allied to the hill Miris, and they are akin to and intermarried with the Abor. They have a reputation for cowardice, and as particularly they are disinherited, they are at the mercy of the Akas, their less numerous but more warlike neighbours on the west. Their clothing is scanty, and its most distinguishing feature is a cane cap with a fringe of beardskin or feathers, which gives them a very curious appearance. The men wear their hair in a plait, which is coiled into a ball on the forehead, to which they fasten their caps with a long skrewer. In 1872 a party of independent Daphlas suddenly attacked a colony of their own tribesmen, who had settled at Amtola in British territory, and carried away forty-four captives to the hills. This led to the Daphla expedition of 1874, when a force of 1000 troops released the prisoners and reduced the tribe to submission. According to the census of 1901 the Daphlas in British territory numbered 954, the tribal country not being enumerated.

DAPHNAE (Taphanhes, Taphne; mod. Defennneh), an ancient fortress near the Syrian frontier of Egypt, on the Pelusan arm of the Nile. Here King Psammetichus established a garrison of foreign mercenaries, mostly Carians and Ionian Greeks (Herodotus ii. 154). After the conquest of Egypt by Nebuchadnezzar in 588 B.C., the Jewish fugitives, of whom Jeremiah was one, came to Taphanthes. When Naucratus was given by Amasis II. the monopoly of Greek traffic, the Greeks were all removed from Daphnae, and the place never recovered its prosperity; in Herodotus's time the deserted remains of the docks and buildings were visible. The site was discovered by Prof. W. M. Flinders Petrie in 1886; the name "Castle of the Jew's Daughter" seems to preserve the tradition of the Jewish refugees. There is a massive fort and enclosure; the chief discovery was a large number of fragments of pottery, which are of great importance for the chronology of vase-painting, since they must belong to the time between Psammetichus and Amasis, i.e. the end of the 7th or the beginning of the 6th century B.C. They show the characteristics of Ionian art, but their shapes and other details testify to their local manufacture.

See W. F. Petrie, "Tanis II., Nebesheh, and Defennneh" (4th Memoir of the Egypt Exploration Fund, 1888). (E. G. B.)

DAPHNE (Gr. for a laurel tree), in Greek mythology, the daughter of the Arcadian river-god Ladon or the Thessalian Peneus, or of the Laconian Amycla. She was beloved by Apollo, and when pursued by him was changed by her mother Gaea into a laurel tree sacred to the god (Ovid, "Metam. i. 452-457"). In the Peloponnesian legends, another suitor of Daphne, Leucippus, son of Oenomach of Pisa, disguised himself as a girl and joined her companions. His sex was discovered while bathing, and he was slain by the nymphs (Pausanias viii. 20; Parthenius, "Erotica, i. 15".

DAPHNE, in botany, a genus of shrubs, belonging to the natural order Thymelaeaceae, and containing about forty species, natives of Europe and temperate Asia. D. Laureola, spurge laurel, a small evergreen shrub with green flowers in the leaf axils towards the ends of the branches and ovoid black very poisonous berries, is found in England in copses and on hedge-banks in stiff soils. D. mesereum, mezereum, a rather larger shrub, 2 to 4 ft. high, has deciduous leaves, and bears fragrant pink flowers in clusters in the axils of last season's leaves, in early spring before the foliage. The bright red or ovoid berries are cathartic, the whole plant is acid and poisonous, and the bark is used medicinally. It is a native of Europe and north Asia, and found apparently wild in copses and woods in Britain. It is a well-known garden plant, and several other species of the genus are cultivated in the open air and as greenhouse plants. D. Cneorum (Europe) is a hardly evergreen trailing shrub, with bright pink sweet-scented flowers. D. pontica (Eastern Europe) is a hardly spreading evergreen with greenish-yellow fragrant flowers. D. indica (China) and D. japonica (Japan) are greenhouse evergreens with respectively red or white and pinkish-purple flowers.

DAPHNEPHORIA, a festival held every ninth year at Thebes in Boeotia in honour of Apollo Ismenius or Galaxius. It consisted of a procession in which the chief figure was a boy of good family and noble appearance, whose father and mother must be alive.
Immediately in front of this boy, who was called Daphnephoros (laurel bearer), walked one of his nearest relatives, carrying an olive branch hung with laurel and flowers and having on the upper end a bronze ball from which hung several smaller balls. Another smaller ball was placed on the middle of the branch or pole (called κωνων), which was then twined round with purple ribbons, and at the lower end with saffron ribbons. These balls were said to indicate the sun, stars and moon, while the ribbons referred to the days of the year, being 365 in number. The Daphnephoros, wearing a golden crown, or a wreath of laurel, richly dressed and partly holding the pole, was followed by a chorus of maidens carrying suppliant branches and singing a hymn to the god. The Daphnephoros dedicated a bronze tripod in the temple of Apollo, and Pausanias (ix. 10. 4) mentions the tripod dedicated there by Amphitryon when his son Heracles had been Daphnephoros. The festival is described by Proclus (in Photius cod. 239).

See also A. Mommsen, Feste der Stadt Athen (1868); C. O. Müller, Orchomenos (1844); article in Daremberg and Saglio's Dictionnaire des antiquités.

DAPHNIS, the legendary hero of the shepherds of Sicily, and reputed inventor of bucolic poetry. The chief authorities for his story are Diodorus Siculus, Aelian and Theocritus. According to his countryman Diodorus (iv. 84), and Aelian (Var. Hist., x. 18), Daphnis was the son of Hermes (in his character of the shepherd-god) and a Sicilian nymph, and was born or exposed and found by shepherds in a grove of laurels (whence his name). He was brought up by the nymphs, or by shepherds, and became the owner of flocks and herds, which he tended while playing on the syrinx. When in the first bloom of youth, he won the affection of a nymph, who made him promise to love none but her, threatening that, if he proved unfaithful, he would lose his eyesight. He failed to keep his promise and was smitten with blindness. Daphnis, who endeavoured to console himself by playing the flute and singing shepherds' songs, soon afterwards died. He fell from a clif, or was changed into a rock, or was taken up to heaven by his father Hermes, who caused a spring of water to gush out from the spot where his son had been carried off. Ever afterwards the Sicilians offered sacrifices at this spring as an expiatory offering for the youth's early death. There is little doubt that Aelian in his account follows Stesichorus (q.v.) of Himera, who in like manner had been blinded by the vengeance of a woman (Helen) and probably sang of the sufferings of Daphnis in his recantation. Nothing is said of Daphnis's blindness by Theocritus, who dwells on his amour with Naiss; his victory over Menalces in a poetical competition; his love for Xenea brought about by the wrath of Aphrodite; his wanderings through the woods while suffering the torments of unrequited love; his death just at the moment when Aphrodite, moved by compassion, endeavours (but too late) to save him; the deep sorrow, shared by nature and all created things, for his untimely end. (Theocritus i. vii. viii.). A later form of the legend identifies Daphnis with a Phrygian hero, and makes him the teacher of Marsyas. The legend of Daphnis and his early death may be connected with the story of Narcissus; and all the beautiful youths cut off in their prime, typical of the luxuriant growth of vegetation in the spring, and its sudden withering away beneath the scorching summer sun.

Keitenstein, Epitome und Skatlon (1805); H. W. Prescott in Harvard Studie, x. (1890); H. W. Stoll in Roscher's Lexikon der Mythologie; and G. Knaack in Pauly-Wissowa's Reallcyclopädie.

DARĀB (originally DARĀGERD), a district of the province of Fars in Persia. It has sixty-two villages, and possesses a hot climate, snow being rarely seen there in winter. It produces a great quantity of dates and much tobacco, which is considered the best in Persia. The town Darāb, the capital of the district, is situated in a very fertile plain, 140 m. S.E. of Shiraz. It has a population of about 5000, and extensive orchards of orange and lemon trees and immense plantations of date-palms. Legend ascribes the foundation of the city to Darius, hence its name Darāb-gerd (Darius-town). In the neighbourhood there are various remains of antiquity, the most important of which is the Kalâh i Darāb, or citadel of Darius, and consists of a series of temples and Civil Service, and is thus fixed the date or explains the history of the fortification. Another monument in the vicinity is a gigantic bas-relief, carved on the vertical face of a rock, representing the victory of the Sassanian Shapur I. (Sapor) of Persia over the Roman emperor Valerian, A.D. 260.

DARBHANGA, a town and district of British India, in the Patna division of Bengal. The town is on the left bank of the Little Baghmati river, and has a railway station. Pop. (1901) 66,244. The town is really a collection of villages that have grown up round the residence of the raja. This is a magnificent palace, with gardens, a menagerie and a good library. There are a first-class hospital, with a Lady Dufferin hospital attached; a handsome market-place, and an Anglo-vernacular school. The district of Darbhanga extends from the Nepalese frontier to the Ganges. It constituted in 1875 out of the unwieldy district of Tihooth. Its area is 3348 sq. m. In 1901 the population was 2,012,611, showing an increase of 4% in the decade. The district contains entirely of an alluvial plain, in which the principal rivers are the Ganges, Buri Gandak, Baghmati, Little Baghmati, Balan and Little Balan, and Tiljuga. The land is especially fertile in the more elevated part of the district S.W. of the Buri Gandak; rice is the staple crop, and it may be noted that the cultivator in Darbhanga is especially dependent on the winter harvest. The chief exports are rice, indigo, linseed and other seeds, saltpetre and tobacco. There are several indigo factories and saltpetre refineries, and a tobacco factory. The district is traversed by the main line of the Bengal & North-Western railway and by branch lines, part of which were begun as a famine relief work in 1874.

The maharaja bahadur of Darbhanga, a Rajput, whose ancestor Mahesh Thakor received the Darbhanga raj (which includes large parts of the modern districts of Darbhanga, Muzaffarpur, Monghyr, Purnea and Bhagalpur) from the emperor Akbar early in the 16th century, is not only the premier territorial noble of Behar but one of the greatest noblemen of all India. Maharaja Rameshwar Singh Bahadur, who succeeded to the raj in 1860 and died in 1898, was distinguished for his public services, and especially as one of the most munificent of living philanthropists. Under his supervision his raj came to be regarded as the model for good and benevolent management; he constructed hundreds of miles of roads planted with trees, bridged all the rivers, and constructed irrigation works on a great scale. His charities were without limit; thus he contributed £300,000 for the relief of the sufferers from the Bengal famine of 1873–1874, and it is computed that during his possession of the raj he expended at least £2,000,000 on charities, works of public utility, and charitable remissions of rent. For many years he served as a member of the legislative council of the viceroy with conspicuous ability and moderation of view. As representative of the landowners of Berar and Bengal he took an important part in the discussion on the Bengal Tenancy Bill. He was succeeded by his brother, Maharaja Rameshwar Singh Bahadur, who was born on the 16th January 1860 and was attaining his majority in 1878 was appointed to the Indian Civil Service serving as assistant magistrate successively at Darbhanga, Champaran and Bhagalpur. In 1886 he was created a raja bahadur, exempted from attendance at the civil courts, and appointed a member of the legislative council of Bengal. He was created a maharaja bahadur on his successor to the raj in 1888. Like his brother, he was educated by an English tutor, and his administration carried on the enlightened traditions of his predecessor.

D'ARBLAY, FRANCES (1752–1840), English novelist and diarist, better known as FANNY BURNET, daughter of Dr Charles Burney (q.v.), was born at King's Lynn, Norfolk, on the 13th of June 1752. Her mother was Esther Sleepe, granddaughter of a French refugee named Dubois. Fanny was the fourth child in a family of six. Of her brothers, James (1750–1821) became an admiral and sailed with Captain Cook on his second and third voyages, and Charles Burney (1757–1817) was a well-known
classical scholar. In 1760 the family removed to London, and Dr Burney, who was now a fashionable music master, took a house in Poultry Street. Mrs Burney died in 1761, when Fanny was only nine years old. Her sisters Esther (Hetty), afterwards Mrs Charles Rousseau Burney, and Susanna, afterwards Mrs Phillips, were sent to school in Paris, but Fanny was left to educate herself. Early in 1766 she paid her first visit to Dr Burney’s friend Samuel Crisp at Chessington Hall, near Epsom. Dr Burney had first made Samuel Crisp’s acquaintance about 1745 at the house of Fulke Greville, grandfather of the diarist, and the two studied music while the rest of the guests hunted. Crisp wrote a play, *Virginia*, which was staged by David Garrick in 1754 at the request of the beautiful countess of Coventry (née Maria Gunning). The play had no great success, and in 1764 Crisp established himself in retirement at Chessington Hall, where he frequently entertained his sister, Mrs Sophia Gast, of Burford, Oxfordshire, and Dr Burney and his family, to whom he was familiarly known as “daddy” Crisp.1 It was to her “daddy” Crisp and her sister Susan that Fanny Burney addressed large portions of her diary and many of her letters. After his wife’s death in 1767, Dr Burney married Elizabeth Allen, widow of Samuel Allen, a wine-merchant.

From her fifteenth year Fanny lived in the midst of an exceptionally brilliant social circle, gathered round her father in Poland Street, and later in his new home in St Martin’s Street, Leicester Fields. Garrick was a constant visitor, and would arrive before eight o’clock in the morning. Of the various “lyons” they entertained she leaves a graphic account, notably of Omai, the Otaheitan native, and of Alexis Orlov, the favourite of Catherine II of Russia. Dr Johnson she first met at her father’s home in March 1777. Her father’s drawing-room, where she met many of the chief musicians, actors and authors of the day, was in fact Fanny’s only school. Her reading, however, was by no means limited. Macaulay stated that in the whole of Dr Burney’s library there was but one novel, *Fielding’s Amelia*; but Austin Dobson points out that she was acquainted with the abbé Prévost’s *Doyen de Killérine*, and with Marivaux’s *Vie de Marianne*, besides Clarissa Harlowe and the books of Mrs Griffith and Mrs Frances Brooke. Her diary also contains the record of much more strenuous reading. Her step-mother, a woman of some cultivation, did not encourage habits of scribbling. Fanny, therefore, made a bonfire of her MSS., among them a *History of Caroline Evelina*, a story containing an account of Evelina’s mother. Luckily her journal did not meet with the same fate. The first entry in it was made on the 30th of May 1768, and it extended over seventy-two years. The earlier portions of it underwent wholesale editing in later days, and much of it was entirely obliterated. She planned out *Evelina, or A Young Lady’s Entrance into the World*, long before it was written down. *Evelina* was published by Thomas Lowndes in the end of January 1778, but it was not until June that Dr Burney learned of its authorship, when the book had been reviewed and praised everywhere. Fanny proudly told Mrs Thrale the secret. Mrs Thrale wrote to Dr Burney on the 22nd of July: “Mr Johnson returned home full of the Prayes of the Book I had lent him, and protesting that there were passages in it which might do honour to Richardson: we talk of it for ever, and he feels ardent after the denouement; he could not get rid of the Rogue, he said.” Miss Burney soon visited the Thrales at Streatham. “I am most consequential day I have spent since my birth” she calls the occasion. It was the prelude to much longer visits there. Dr Johnson’s best compliments were made for her benefit, and eagerly transcribed in her diary. His affectionate friendship for “little Burney” only ceased with his death.

*Evelina* was a continued success. Sir Joshua Reynolds sat up all night to read it, as did Edmund Burke, who came next to Johnson in Miss Burney’s esteem. She was introduced to Elizabeth Montagu and the other bluestocking ladies, to Richard Brinsley Sheridan, and to the gay Mrs Mary Cholmondeley, the sister of Peg Woffington, whose manners, as described in the diary, explain much of *Evelina*. At the suggestion of Mrs Thrale, and with offers of help from Arthur Murphy, and encouragement from Sheridan, Fanny began to write a comedy. Crisp, realizing the limitations of her powers, tried to dissuade her, and the piece, *The Willings*, was suppressed in deference to what she called a “hissing, groaning, cat-calling epistle” from her two “daddies.” Meanwhile her intercourse with Mrs Thrale proved very exciting, and left her little time for writing. She went with her to Bath in 1780, and was at Streatham again in 1781. Her next book was written partly at Chessington and after much discussion with Mr Crisp. *Cecilia; or, Memoirs of an Heiress*, by the author of *Evelina*, was published in 5 vols. in 1782 by Messrs Payne & Cadell (who paid the author £250—not £200 as stated by Macaulay). If *Cecilia* has not quite the freshness and charm of *Evelina*, it is more carefully constructed, and contains many happy examples of what Johnson called Miss Burney’s gift of “character-mongering.” Burke sent her a letter full of high praise. But some of her friends found the writing too often modelled on Johnson’s, and Horace Walpole thought the personages spoke too uniformly in character.

On the 24th of April 1783, Fanny Burney’s “most judicious adviser and innumerable comforter,” “daddy” Crisp, died. He was her devoted friend, as she was to him, “the dearest thing on earth.” The next year she was to lose two more friends. Mrs Thrale married Piozzi, and Johnson died. Fanny had met the celebrated Mrs Delany in 1783, and she now attached herself to her. Mrs Delany, who was living (1785) in a house near Windsor Castle presented to her by George III., was on the friendliest terms with both the king and queen, and Fanny was honoured with more than one royal interview. Queen Charlotte, soon afterwards, offered Miss Burney the post of second keeper of the robes, with a salary of £200 a year, which after some hesitation was accepted. Much has been said against Dr Burney for allowing the authorship of *Evelina* and *Cecilia* to undertake an office which meant separation from all her friends and a wearisome round of court ceremonial. On the other hand, it may be fairly urged that Fanny’s literary gifts were really limited. She had written nothing for four years, and apparently felt she had used her best material. “What my daddy Crisp says,” she wrote as early as 1779, “that it would be the best policy, but for pecuniary advantages, for me to write more rather than exactly what I have always thought since *Evelina* was published” (Diary, i. 258). Her misgivings as to her unfitness for court life were quite justified. From Queen Charlotte she received unvarying kindness, though she was not very clever with her waiting-maid’s duties. She had to attend the queen’s toilet, to take care of her lap-dog and her snuff-box, and to help her senior, Mrs Schwellenberg, in entertaining the king’s equerries and visitors at tea. The constant association with Mrs Schwellenberg, who has been described as “a peevish old person of uncertain temper and impaired health, swaddled in the buckram of backstairs etiquette,” proved to be the worst part of Fanny’s duties. Her diary is full of amusing court gossip, and sometimes deals with graver matters, notably in the account of Warren Hastings’ trial, and in the story of the beginning of George III.’s madness, as seen by a member of his household. But the strain told on her health, and after pressure both from Fanny and her numerous friends, Dr Burney prepared with her a joint memorial asking Dr Johnson to resign. She left the royal service in July 1791 with a retiring pension of £100 a year, granted from the queen’s private purse, and returned to her father’s house at Chelsea. Dr Burney had been appointed organist at Chelsea Hospital in 1783, through Burke’s influence.

In 1792 she became acquainted with a group of French exiles, who had taken a house, Juniper Hall, near Mickleham, where Fanny’s sister, Mrs Phillips, lived. On the 31st of July 1793 she married one of the exiles, Alexandre D’Arblay, an artillery officer, who had been adjutant-general to La Fayette. They took a cottage at Bookham on the strength, it appears, of Miss Burney’s pension. In 1793 she produced her *Brief Reflections relative to the Emigrant French Clergy*. Her son Alexandre was born on the 18th of December 1794. In the following spring
Sheridan produced at Drury Lane her Eddy and Eligiva, a tragedy which was not saved even by the acting of the Kemble and Mrs Siddons. The play was never printed. Money was not the object, and Madame D'Arblay was therefore persuaded to issue her next novel, Camilla: or A Picture of Youth (5 vols., 1796), by subscription. A month after publication Dr Burney told Horace Walpole that his daughter had made £2000 by the book, and this sum was almost certainly augmented later. It is interesting to note that Jane Austen was among the subscribers. Unfortunately its literary success was not as great. "How I like Camilla?" wrote Horace Walpole to Miss Hannah More (August 20th, 1796), "I do not care to say how little. Alas! she has reversed experience ..." this author knew the world and penetrated characters before she had stepped over the threshold; and, now she has seen so much of it, she has little or no insight at all: perhaps she apprehended having seen too much, and kept all the bags of foul air that she brought from the Cave of Tempests too closely tied." Nevertheless Camilla has found judicious persons to admire it, notably Jane Austen in Northanger Abbey. A second play, Love and Fashion, was actually put in rehearsal in 1799, but was withdrawn in the next year. In 1801 Madame D'Arblay accompanied her husband to Paris, where General D'Arblay eventually obtained a place in the civil service of the Empire. In 1812 she returned to England, and in her son Alexander's political career. In 1814 she published The Wanderer; or Female Difficulties. Possibly because readers expected to find a description of her impressions of revolutionary France, it had a large sale, from which the author realized £2000. Nobody, it has been said, ever read The Wanderer. In the end of the year General D'Arblay came to England and took his wife back to France. During the Hundred Days of 1815 she was in Belgium, and the vivid account in her Diary of Brussels during Waterloo may have been used by Thackeray in Vanity Fair. General D'Arblay now received permission to settle in England. After his death, which took place at Bath on the 3rd of May 1818, his wife lived in Bolton Street, Piccadilly. There she was visited in 1826 by Sir Walter Scott, who describes her (Journal, November 18th, 1826) as an elderly lady with no remains of personal beauty, but with a gentle manner and a pleasing countenance. The later years of her life were occupied with the editing of the Memoirs of Dr Burney, arranged from her own manuscripts, from family papers and from personal recollections (5 vols., 1832). Her style had, as time went on, altered for the worse, and her book is full of extraordinary, astonishing facts. Madame D'Arblay died in London on the 6th of January 1849, and was buried at Walcot, Bath, near her son and husband.

Madame D'Arblay is still read in Evelina, but her best title to the affections of modern readers is the Diary and Letters. The small egotisms of the writer do not alienate other readers as they did John Wilson Croker. Dr Johnson lives in its pages almost as vividly as in those of Boswell, and King George and his wife in a frienlier light than in most of their contemporary portraits. Croker, in The Quarterly Review, April 1833 and June 1842, made two attacks on Madame D'Arblay. The first is an unkind, but largely justifiable criticism on the Memoirs of Dr Burney. In the second, a review of the first three volumes of the Diary and Letters, Croker abused the writer's innocent vanity, and declared that, considering their bulk and pretensions, the Diary and Letters were "nearly the most worthless we have ever waded through." These pronouncements drew forth the eloquent defence by Lord Macaulay, first printed in The Edinburgh Review, January 1843, which, in spite of some inaccuracies and considerable exaggeration, has perhaps more than anything else to maintain Madame D'Arblay's constant popularity.

BIBLIOGRAPHY.—The Diary and Letters of Madame D'Arblay was edited by her niece, Charlotte Frances Barrett, in 7 vols. (1842-1846). The text, covering the years 1775-1840, was edited with preface, notes and reproductions of contemporary portraits and other illustrations, by Mr Austen Dobson in 6 vols. (1904-1905). This Diary, which begins with the publication of Evelina, was supplemented in 1889 by The Early Diary of Frances Burney (1768-1778), which was in the first instance suppressed as being of purely private interest, edited by Mrs Annie Raine Ellis. With an introduction giving many particulars of the Burney family. Mrs Ellis also edited Evelina for "Bohn's Novelist's Library" in 1881, and Cecilia in 1882. See also Austin Dobson's Fanny Burney (Madame D'Arlay) (1903), in the "English Men of Letters Series.

**DARBOY, GEORGES** (1813-1871), archbishop of Paris, was born at Fayl-Billot in Haut-Marne on the 16th of January 1813. He studied with distinction at the seminary at Langres, and was ordained priest in 1836. Transferred to Paris as almoner of the college of Henry IV., and honorary canon of Notre Dame, he became the close friend of Archbishop Affre and of his successor, Marechal-Francisque-Henri de Bourrienne. He was bishop of Nancy 1856, and in January 1863 was raised to the archbishopric of Paris. The archbishop was a strenuous upholder of episcopal independence in the Gallican sense, and involved himself in a controversy with Rome by his endeavours to suppress the jurisdiction of the Jesuits and other religious orders within his diocese. Pius IX. refused him the cardinal's hat, and rebuked him for his liberalism in a letter which was probably not intended for publication. At the Vatican council he vigorously maintained the rights of the bishops, and strongly opposed the dogma of papal infallibility, against which he voted as inopportune. When the dogma had been finally adopted, however, he was one of the first to set the example of submission. Immediately after his return to Paris the war with Prussia broke out, and his conduct during the disastrous year that followed was marked by a devoted heroism which has secured for him an enduring fame. He was active in organizing relief for the wounded at the commencement of the war, remained bravely at his post during the siege, and refused to seek safety by flight during the brief triumph of the Commune. On the 4th of April 1871 he was arrested by the communists as a habitation of confined in the prison at Mazas, from which he was transferred to La Roquette on the advance of the army of Versailles. On the 27th of May he was shot within the prison along with several other distinguished hostages. He died in the attitude of blessing and uttering words of forgiveness. His body was recovered with difficulty, and, having been embalmed, was buried with imposing ceremony at the public expense on the 7th of June. It is a noteworthy fact that Darboy was the third archbishop of Paris who perished by violence in the period between 1848 and 1871. Darboy was the author of a number of works, of which the most important are a Vie de St Thomas Becket (1859), a translation of the works of St Denis the Areopagite, and a translation of the Invitation of Christ.

See J. A. Foulon, Histoire de la vie et des œuvres de Mgr. Darboy (Paris, 1889); and L. Guillemot, Vie de Mgr. Darboy (Paris, 1889), biographies written from the clerical standpoint, which have called forth a number of pamphlets in reply.

**DARCY, THOMAS DARCY**, BARON (1467-1537), English soldier, was a son of Sir William Darcy (d. 1488), and belonged to a family which was seated at Templehurst in Yorkshire. In early life he served, both as a soldier and a diplomatist, in Scotland and on the Scottish borders, where he was captain of Berwick; and in 1505, having been created Baron Darcy, he was made warden of the east marches towards Scotland. In 1511 Darcy led some troops to Spain to help Ferdinand and Isabella against the Moors, but he returned almost at once to England, and was with Henry VIII. on his French campaign two years later. One of the most influential noblemen in the north of England, where he held the offices of admiral and captain general of the northern plains and of the royal council, dividing his time between state duties in London and a more active life in the north. He showed great zeal in preparing accusations against his former friend, Cardinal Wolsey; however, after the cardinal's fall his words and actions caused him to be suspected by Henry VIII. Disliking the separation from Rome, Darcy asserted that matrimonial cases were matters for the decision of the spiritual power, and he was soon communicating with Eustace Chapuys, the ambassador of the emperor Charles V., about an invasion of England in the interests of the Roman Catholics. Detained in London against his will by the king, he was not allowed to return to Yorkshire until late in 1535, and about a year after his arrival in the north the rising known as the Pilgrimage of Grace broke out. For a short time Darcy defended Pontefract Castle against the rebels, but soon
he surrendered to them this stronghold, which he could certainly have held a little longer, and was with them at Doncaster, being regarded as one of their leaders. Upon the dispersal of the insurgents Darcy was pardoned, but he pleaded illness when Henry requested him to proceed to London. He may have assisted to suppress the rising which was renewed under Sir Francis Bigod early in 1537, but the king believed, probably with good reason, that he was guilty of fresh treasons, and he was seized and hurried to London. During his imprisonment he uttered his famous remark about Thomas Cromwell:—“Cromwell, it is thou that art the very original and chief cause of all this rebellion and mischief, and I trust that or thou die, though thou wouldst procure all the noblemen’s heads within the realm to be stricken off, yet shall there one head remain that shall strike off thy head.” Tried by his peers, Darcy was found guilty of treason, and was beheaded on the 20th of June 1537. In 1548 his barony was revived in favour of his son George (d. 1557), but it became extinct on the death of George’s descendant John in 1635.

DARDANELLES (Turk. Bahir-Sejida Boghaz), the strait, in ancient times called the Hellespont (q.v.), uniting the Sea of Marmora with the Aegean, so called from the two castles which protect the narrowest part and preserve the name of the city of Dardanaea. Darius the Mede, Cambyses, Darius the Great, Darius II., and Mithradates in 84 B.C. The shores of the strait are formed by the peninsula of Gallipoli on the N.W. and by the mainland of Asia Minor on the S.E.; it extends for a distance of about 47 m. with an average breadth of 3 or 4 m. At the Aegean extremity stand the castles of Sedil Bahr and Kum Kaleh respectively in Europe and Asia; and near the Marmora extremity are situated the important town of Gallipoli (Callipolis) on the northern side, and the less important though equally famous Lamsaki or Lapsaki (Lampascus) on the southern. The two castles of the Dardanelles par excellence are Chanak-Kaleh, Sultanlieh-Kaleh, or the Old Castle of Anatolia, and Kildil-Bahr, or the Old Castle of Rumelia, which were long but erroneously identified with Sestos and Abydos now located farther to the north. The strait of the Dardanelles is famous in history for the passage of Xerxes by means of a bridge of boats, and for the similar exploit on the part of Alexander. It is famous also from the story of Hero and Leander, and from Lord Byron’s successful attempt (repeated by others) to rival the ancient swimmer. Strategically the Dardanelles is of great importance, since commands the approach of Constantinople from the Mediterranean. The passage of the strait is easily defended, but in 1807 the English admiral (Sir) J. T. Duckworth made his way past all the fortresses into the Sea of Marmora. The treaty of July 1841, confirmed by the Paris peace of 1856, prescribed that no foreign ship of war might enter the strait except by Turkish permission, and even merchant vessels are only allowed to pass the castle of Chanak-Kaleh during the day.

DARDANELLES (Turk. Sultanlieh Kalehsi, or Chanah Kalehsi), the chief town and seat of government of the lesser Turkish province of Bigha, Asia Minor. It is situated at the mouth of the Rhodius, and at the narrowest part of the strait of the Dardanelles, where its span is but a mile across. Its recent growth has been rapid, and it possesses a lyceum, a military hospital, a public garden, a theatre, quays and water-works. Exclusive of the garrison, the population is estimated at 13,000, of whom one-half are Turkish, and the remainder Greek, Jewish, Armenian and European. There are numerous Greek and Catholic churches, and a synagogue. There is a resident Greek bishop. The civil governor, and the military commandants of the numerous fortresses on each side of the strait, are stationed here. Many important works have been added to the defences. The Ottoman fleet is stationed at Nisard (anc. Abydos). The average annual number of merchant vessels passing the strait is 12,000 and the regular commercial vessels calling at the port of Dardanelles are represented by numerous foreign agencies. Besides the Turkish telegraphic service, the Eastern Telegraph Company has a station at Dardanelles, and there are Turkish, Austrian, French and Russian post offices. The import trade consists of manufactures, sugar, flour, coffee, rice, leather and iron. The export trade consists of valonia (largely produced in the province), wheat, barley, beans, chickpeas, canary seed, liquorece root, pine and oak timber, wine and pottery. Excepting in the items of wine and pottery, the export trade shows steady increase. Every year sees a larger area of land brought under cultivation by immigrants, and adds to the number of mature (i.e. fruit-bearing) valonia trees. Vine-growers are discouraged by heavy fiscal charges, and by the low price of wine; many have uprooted their vineyards. The pottery trade is affected by change of fashion, and the factories are losing their importance. The lower quarters of the town were heavily damaged in the winter of 1900-1901 by repeated inundations caused by the overflow of the Rhodius.

See V. Cuinet, Turquie d’Asie (Paris, 1890-1900).

DARDANUS, in Greek legend, son of Zeus and Electra, the mythical founder of Dardanus on the Hellespont and ancestor of the Dardans of the Troad and, through Aeneas, of the Romans. His original home was supposed to have been Arcadia, where he married Chryse, who brought him as dowry the Palladium of Troy, an olive-branch said to have been reserved for herself. Having slain his brother Iasius or Iasion (according to others) Iasius was struck by lightning, Dardanus fled across the sea. He first stopped at Samothrace, and when the island was visited by a flood, crossed over to the Troad. Being hospitably received by Teucer, he married his daughter Batea and became the founder of the royal house of Troy.

See Apollodorus iii. 12; Diod. Sic., v. 48-75; Virgil, Aeneid, iii. 163 ff.; articles in Pauly-Wissowa’s Realencyclopadie and Roscher’s Lexikon der Mythologie.

DARDISTAN, a purely conventional name given by scientists to a tract of country on the north-west frontier of India. There is no modern race called Dards, and no country so named by its inhabitants, but there is a submerged right bank of the Indus, from the Kandia river to Batera, apply it to the dwellers on the left bank. In the scientific use of the appellation, Dardistan comprises the whole of Chitral, Yasin, Panjal, the Gilgit valley, Hunza and Nagar, the Astor valley, the Indus valley from Bunji to Batera, the Kohistan-Malazi, i.e. the upper reaches of the Panjora river, and the Kohistan of Swat. The so-called Dard races are referred to by Pliny and Ptolemy, and are supposed to be a people of Aryan origin who ascended the Indus valley from the plains of the Punjab, reaching as far north as Chitral, where they dispossessed the Khos. They have left their traces in the different dialects, Khaswars, Burushki and Shina, spoken in the Gilgit agency.

The question of Dardistan is debated at length in Leitch’s Dardistan (1877); Drew’s Jammoo and Kashmir Territories (1876); Biddulph’s Tribes of the Hindu-Kush (1880) and Durand’s The Making of a Frontier (1889). For further details see Gilgit.

DARES PHYRGUS, according to Homer (IIiad v. 9) a Trojan priest of Hephæastus. He was supposed to have been the author of an account of the destruction of Troy, and to have lived before Homer (Aelian, Var. Hist. xi. 2). A work in Latin, purporting to be a translation of this, and entitled Daresis Phrygiæ de excidio Troiae historia, was much read in the middle ages, and was then ascribed to Cornelius Nepos, who is made to dedicate it to Sallust; but the language is extremely corrupt, and the work belongs to a period much later than the time of Nepos (probably the 5th century a.d.). It is doubtful whether the work as we have it is an abridgement of a larger Latin work or an adaptation of a Greek original. Together with the similar work of Dictys C Omosis (with which it is generally printed) the De excidio forms the chief source for the numerous middle age accounts of the Trojan legend.

(See Dictys; and O. S. von Fleschken, Daresstudien, 1908.)

DAR-E-S-SALAAM ("The harbour of peace"), a seaport of East Africa, in 6° 50' S, 30° 20' E., capital of German East Africa. Pop. (1909), estimated at 24,000, including some 500 Europeans. The entrance to the harbor, which is perfectly sheltered (hence its name), is through a narrow opening in the palm-covered shore. The harbour is provided with a floating dock, completed in 1902. The town is built on the northern
sweep of the harbour and is European in character. The streets are wide and regularly laid out. The public buildings, which are large and handsome, include the government and customs offices on the quay opposite the spot where the mail boats anchor, the governor’s house, state hospital, post office, and the Boma or barracks. Adjoining the governor’s residence are the botanical gardens, where many European plants are tested with a view to acclimatization. There are various churches, and government and mission schools. In the town are the head offices of the Deutsch Ostafrikanische Gesellschaft, the largest trading company in German East Africa. The mangrove swamps at the north-west end of the harbour have been drained and partially built over.

Until the German occupation nothing but an insignificant village existed at Dar-es-Salaam. In 1862 Said Majid, sultan of Zanzibar, decided to build a town on the shores of the bay, and began the erection of a palace, which was never finished, and of which but scanty ruins remain. In 1871 Said Majid died, and his scheme was abandoned. In 1876 Mr (afterwards Sir) William McKinnon began the construction of a road from Dar-es-Salaam to Victoria Nyanza, intending to make of Dar-es-Salaam an important seaport. This project however failed. In 1883 Dr Carl Peters occupied August 2 (vols., 1883; Histoire des classes agricoles in France depuis sauvage jusqu’a Louis XVI (2 vols., 1831 and 1835), now quite obsolete; and a Histoire de France (8 vols., 1865-1873), completed by a Histoire de la Restauration (2 vols., 1880), a good summary of the work of Veil-Castel, and by a Histoire du Gouvernement de Julliet, a dry enumeration of dates and facts. Before the publication of Lavisse’s great work, Dareth’s general history of France was the best of its kind; it surpassed in accuracy the work of Henri Martin, especially in the ancient periods, just as Martin’s in its turn was an improvement upon that of Simond.

DARESTE, A. E. C.—DARFUR

DARFUR, a country of east central Africa, the westernmost state of the Anglo-Egyptian Sudan. It extends from about 18° N. to 16° N. and from 27° E. to 29° 30’ E., has an area of some 150,000 sq. m., and an estimated population of 750,000. It is bounded N. by the Libyan desert, W. by Wadi (French Congo), S. by the Bahr-el-Ghazal and E. by Kordofan. The two last-named districts are madrias (provinces) of the Anglo-Egyptian Sudan. The greater part of the country is a plateau from 2000 to 3000 ft. above sea-level. A range of mountains of volcanic origin, the Jebel Marra, runs N. and S. about the line of the 24° E. for a distance of over 100 m., its highest points attaining from 5000 to 6000 ft. East to west this chain extends about 80 m. Eastward the mountains fall gradually into sandy, bush-covered steppes. North-east of Jebel Marra lies the Jebel Melah (3500 ft. high), a range much disturbed by volcanic action, and Bir-el-Melah, an extinct volcano with a crater 150 ft. deep. South of Jebel Marra are the plains of Dar Dima and Dar Uma; S.W. of the Marra the plain is 4000 ft. above the sea. The watershed separating the basins of the Nile and Lake Chad runs north and south through the centre of the country. The mountains are scored by numerous khors, whose lower courses can be traced across the plains. The Nile valley, which formerly contained large rivers which flowed N.E. and E. to the Nile, W. and S.W. to Lake Chad, S. and S.E. to the Bahr-el-Ghazal. The streams going N.E. drain to the Wadi Melah, a dry river-bed which joins the Nile near Debba, but on reaching the plain the waters sink into the sandy soil and disappear. The torrents flowing directly east towards the Nile also disappear in the sandy deserts. The khors in the W., S.W. and S.,—the most fertile part of Darfur—contain turbulent torrents in the rainy season, when much of the southern district is flooded. Not one of the streams is perennial, but in times of heavy rainfall the waters of some khors reach the Bahr-el-Homr tributary of the Bahr-el-Ghazal. (For some 200 m. the Bahr-el-Homr marks the southern frontier of the country.) In the W. and S. water can always be obtained in the dry season by digging 5 or 6 ft. below the surface of the khors.

The climate, except in the south, where the rains are heavy and the soil is a damp clay, is healthy except after the rains. The rainy season lasts for three months, from the middle of June to the middle of September. In the neighbourhood of the khors the vegetation is fairly rich. The chief trees are the acacias whence gum is obtained, and baobab (Adansonia digitata); while the sycamore and, in the Marra mountains, the Euphorbia candelabrum are also found. In the S.W. are densely forested regions. Cotton and tobacco are indigenous. The most fertile land is found on the slopes of the mountains, where wheat, durra, dukan (a kind of millet and the staple food of the people) and other grains are grown. Other products are sesame, cotton, cucumbers, water-melons and onions.

Copper is obtained from Hofrat-el-Nahas in the S.E., iron is wrought in the S.W.; and there are deposits of rock-salt in various places. The copper mines (in o° 48’ N. 24° 3’ E.) are across the Darfur frontier in the Bahr-el-Ghazal province. The vein runs N.W. and S.E. and in places rises in ridges 2 ft. above the general level of ground. There is an immense quantity of ore, (silicate and carbonate) specimens containing 14% of metal. Camels and cattle are both numerous and of excellent breeds. Some of the Arab tribes, such as the Baggara, breed only cattle, though the Kordofan tribes in the north allow themselves to rearing of hogs. Horses are comparatively rare; they are a small but sturdy breed. Sheep and goats are numerous. The ostrich, common in the eastern steppes, is bred by various Arab tribes, its feathers forming a valuable article of trade.

Inhabitants.—The population of Darfur consists of negroes and Arabs. The negro For, forming quite half the inhabitants, occupy the central highlands and part of the Dar Dima and Dar Uma districts; they speak a special language, and are subdivided into numerous tribes, of which the most influential are the Masabat, the Kunjara and the Kera. They are of middle height, and have rather irregular features. The For are described as clean and industrious, somewhat fanatic, but generally amenable to civilization, and freedom-loving. The Massalit are
a negro tribe which, breaking off from the For some centuries back, have now much Arab blood, and speak Arabic; while the Tunjur are an Arab tribe which must have arrived in the Sudan at a very early date, as they have incorporated a large For element, and no longer profess Mahommedan. The Dago (Tago) formerly inhabited Jebel Marra, but they have been driven to the south and west, where they maintain a certain independence in Dar Sula, but are treated as inferiors by the For. The Zaghawa, who inhabit the northern borders, are on the contrary regarded by the For as their equals, and have all the prestige of a race that at one time made its influence felt as far as Bornu. Among other tribes may be mentioned the Berti and Takrur, the Birgird, the Beraunus, and immigrants from Wadai and Bagirmi, and Fula from west of Lake Chad. Genuine Arab tribes, e.g. the Baggara and Homr, are numerous, and they are partly nomadic and partly settled. The Arabs have not, generally speaking, mixed with the negro tribes. They are great hunters, making expeditions into the desert for five or six days at a time in search of ostriches.

Slaves, ostrich feathers, gum and ivory used to be the chief articles of trade, a caravan going annually by the Arbaín (" Forty Days ") road to Assiût in Egypt and taking back cloth, fine-arms and other articles. The slave trade has ceased, but feathers, gum and ivory still constitute the chief exports of the country. The principal imports are cotton goods, sugar and tea. There is also an active trade in camels and cattle.

The internal administration of the country is in the hands of the sultan, who is officially recognized as the agent of the Sudan government. The administrative system resembles that of other Mahommedan countries.

The capital is El-Fasher, pop. about 10,000, on the western bank of the Wadi Tendelty in an angle formed by the junction of that wadi with the Wadi-el-Kho, one of the streams which flow towards the Bahrl-el-Homr. Fasher is the residence of the sultan. There are a few fine buildings, but the town consists mainly of tuks and box-shaped straw sh. It is 500 m. W.S.W. of Khartum. Dara, a small market town, is 110 m. S. of El-Fasher. Shakkra is in the S.E. of the country near the Bahrl-el-Homr, and was formerly the headquarters of the slave dealers.

History.—The Dago or Tago negroes, inhabitants of Jebel Marra, appear to have been the dominant race in Darfur in the earliest period to which the history of the country goes back. How long they ruled is uncertain, little being known of them save a list of kings. According to tradition the Tago dynasty was displaced, and Mahommedanism introduced, about the 14th century, by Tunjur Arabs, who reached Darfur by way of Bornu and Wadai. The last Tunjur king was Ahmed-el-Makur, who married the daughter of the last Tago monarch. Ahmed reduced many unruly chiefs to submission, and under him the country prospered. His great-grandson, the sultan Dali, a celebrated figure in Darfur histories, was on his mother's side a For, and thus was effected a union between the negro and Arab races. Dali divided the country into provinces, and established a penal code, which, under the title of Kitab Dali or Dali's Book, is still preserved, and shows principles essentially different from those of the Koran. His grandson Soleiman (usually distinguished by the Forian epithet Solon, the Arab or the Red) reigned from 1506 to 1637, and was a great warrior and a devoted Mahommedan. Soleiman's grandson, Ahmed Bahr (1682-1722), made Islam the religion of the state, and increased the prosperity of the country by encouraging immigration from Bornu and Bagirmi. His rule extended east of the Nile as far as the banks of the Athara. Under succeeding monarchs the Dali were involved in wars with Sennar and Wadai, declined in importance. Towards the end of the 18th century a sultan named Mahommed Terab led an army against the Funj, but got no further than Omduran. Here he was stopped by the Nile, and found no means of getting his army across the river. Unwilling to give up his project, Terab remained at Omduran for months. He was poisoned by his wife at the instigation of disaffected chiefs, and the army returned to Darfur. The next monarch was Abd-er-Rahman, surnamed el-Raschid or the Just. It was during his reign that Napoleon

Bonaparte was campaigning in Egypt; and in 1790 Abd-er-Rahman wrote to congratulate the French general on his defeat of the Mamelukes. This Bonaparte replied by asking the sultan to send him by the next caravan 2000 black slaves upwards of sixteen years old, strong and vigorous. To Abd-er-Rahman likewise is due the present situation of the Fasher, or royal township. The capital had formerly been at a place called Kobbé. Mahommed-el-Fadhl, his son, was for some time under the control of an energetic eunuch, Mahommed Kurra, but he ultimately made himself independent, and his reign lasted till 1839, when he died of leprosy. He devoted himself largely to the subjection of the semi-independent Arab tribes who lived in the country, notably the Rizigáth, thousands of whom he slew. In 1821 he lost the province of Kordofan, which in that year was conquered by the Egyptians. Of his forty sons, the third, Mahommed Hassan, was appointed his successor. Hassan is described as a religious but avaricious man. In the later part of his reign he became involved in trouble with the Arab slave raiders who had seized the Bahr-el-Ghazal, looked upon by the Darfurians as their especial "slave preserve." The negroes of Bahr-el-Ghazal paid tribute of ivory and slaves to Darfur, and these were the chief articles of merchandise sold by the Darfurians to the Egyptian traders along the Arbaín road to Assiût. The loss of the Bahr-el-Ghazal caused therefore much annoyance to the people of Darfur. Hassan died in 1873, blind and advanced in years, and the succession passed to his youngest son Ibrahim, who soon found himself engaged in a conflict with Zobeir (q.), the chief of the Bahr-el-Ghazal slave traders, and with an Egyptian force from Khartum. The war resulted in the destruction of the kingdom. Ibrahim was slain in battle in the autumn of 1874, and his uncle Hassab Allah, who sought to maintain the independence of his country, was captured in 1875 by the troops of the khedive, and removed to Cairo with his family. The Darfurians were restored under Egyptian rule. Various revolts were suppressed, but in 1879 General Gordon (then governor-general of the Sudan) suggested the reinstatement of the ancient royal family. This was not done, and in 1881 Slatin Bey (Sir Rudolf von Slatin) was made governor of the province. Slatin defended the province against the forces of the Mahdi, who were led by a Rizigata sheik named Madibbo, but was obliged to surrender (December 1883), and Darfur was incorporated in the Mahdi's dominions. The Darfurians found Dervish rule as irksome as that of the Egyptians had been, and a state of almost constant warfare ended in the gradual retirement of the Dervishes from Darfur. Following the overthrow of the khiláfah at Omduran in 1886 the new (Anglo-Egyptian) Sudan government recognized (1889) Ali Dinar, a grandson of Mahommed-el-Fadhl, as sultan of Darfur, on the payment by that chief of an annual tribute of £500. Under Ali Dinar, who during the Mahdíst had been kept a prisoner in Omduran, Darfur enjoyed a period of peace.

The first European traveller known to have visited Darfur was William George Browne (q.), who spent two years (1793-1795) at Kobbé. Sheikh Mahommed-el-Tounsi travelled in 1803 through various regions of Africa, including Darfur, in search of Omar, his father, and afterwards gave to the world an account of his wanderings, which was translated into French in 1845 by M. Perron. Gustav Nachtigal in 1873 spent some months in Darfur, and since that time the country has become well known through the journeys of Gordon, Slatin and others.

Authorities.—Browne's account of Darfur will be found in his Travels in Africa, Egypt and Syria (London, 1799); Nachtigal's account of the Mahdíst period is given in his Travels in the Sudan (2 vols. London, 1865), and in his The Anglo-Egyptian Sudan (London, 1895), edited by Count Gleichen, and the bibliography given under Sudan.

DARGAI, the name of a mountain peak and a frontier station in the north-west Frontier Province of India. The mountain peak is situated on the Samana Range, and the Kohat border, and is famous for the stand made there by the Afridis and Orakzais in
the Tirah Campaign. (See TIRAH CAMPAIGN.) Dargai station is
situated on the Peshawar border, and is the terminus of the
frontier railway running from Nowshera to the Malakand Pass.
DARGOMIJSKY, ALEXANDER SERGIEVICH (1832-1869),
Russian composer, was born in 1832, and educated in St Peter-
burg. He was already known as a talented musical amateur
when in 1833 he met Glinka and was encouraged to devote
himself to composition. His light opera Esmeralda was written
in 1839, and his Roussalka was performed in 1856, but he had but
small success or recognition either at home or abroad, except
in Belgium, till the 'sixties, when he became one of Balakirev's
circle. His opera The Stone Guest then became famous among
the progressive Russian school, though it was not performed till
1872. Dargomijsky died in January 1869. His compositions
include a number of songs, and some orchestral pieces.
DARIAL, a gorge in the Caucasus, at the east foot of Mt.
Kasbek, pierced by the river Terek for a distance of 8 m., betw een
vertical walls of rock (5000 ft.). It is mentioned in the Georgian
annals under the names of Rahani, Dargani, Darialani; the
Persians and Arabs knew it as the Gate of the Alans; Strabo
calls it Porta Caucasica and Porta Cuma; Ptolemy, Porta Sarmatia;
it was sometimes known as Porta Caesarea (a name best arrived
at from the ancient Roman pastime of the Caesars at Dara, near
Derbent, and the Tartars call it Darayesh. Being the only
available passage across the Caucasus, it has been fortified since
a remote period—at least since 150 B.C. In Russian poetry it has
been immortalized by Lermontov. The present Russian fort,
Darian, which guards this section of the Caucasian military road,
is at the northern issue of the gorge, at an altitude of 4746 ft.
DARIEN, a district covering the eastern part of the isthmus
joining Central and South America. It is mainly within the
republic of Panama, and gives its name to a gulf of the Carribean
Sea. Darien is of great interest in the history of geographical
discovery. It was reconnoitred in the first year of the 16th
century by Rodrigo Bastidas of Seville; and the first settlement
was Santa Maria la Antigua, situated on the small Darien river,
north-west of the mouth of the Atrato. In 1513 Vasco Nuñez
de Balboa stood "silent upon a peak in Darien," and saw the
Pacific at his feet stretching inland in the Gulf of San Miguel;
and for long this narrow neck of land seemed altogether to proffer
and refuse a means of transit between the two oceans. The first
serious attempt to turn this isthmus to permanent account as a
trade route dates from the beginning of the 18th century, and
forms a chapter in Scott's history of the Spanish empire. In 1731
a project was passed by the Scottish parliament giving extensive powers
to a company trading to Africa and the Indies; and this company,
under the advice of one of the most remarkable economists of the period,
William Paterson (q.v.), determined to establish a colony on the isthmus of Darien as a general emporium for the commerce of all the nations of the world. Regarded with
disfavour both in England and Holland, the project was taken up in
Scotland with the enthusiasm of national rivalry towards
England, and the "subscriptions sucked up all the money in the
country." On the 26th of July 1698 the pioneers set sail from
Leith amid the cheers of an almost ensvious multitude; and on
the 4th of November, with the loss of only fifteen out of 1200 men,
they arrived at Darien, and took up their quarters in a well-
defended spot, with a good harbour and excellent outlook.
The country they named New Caledonia, and two sites selected for
future cities were designated respectively New Edinburgh and
New St Andrews. At first all seemed to go well; but by and by
lack of provisions, sickness and anarchy reduced the settlers to
the most miserable plight; and in June 1699 they re-embar ked
in their vessels, a weak and hopeless company, to sail whither
soever Providence might direct. Meanwhile a supplementary
expedition had been prepared in Scotland; two vessels were
despatched in May, and four others followed in August. But
this venture proved even more unfortunate than the former.
The colonists arrived broken in health; their spirits were crushed
by the fate of their predecessors, and embittered by the harsh
fanaticism of the four ministers whom the general assembly of
the Church of Scotland had sent out to establish a regular
presbyterian organization. The last addition to the settlement
was the company of Captain Alexander Campbell of Fonah, who
arrived only to learn that a Spanish force of 1500 or 1600 men lay
encamped at Tubaucani, on the river Santa Maria, waiting for
the appearance of a Spanish squadron in order to make a combined
attack on the fort. Captain Campbell, on the second day after
his arrival, marched with 200 men across the isthmus to Tubaucani,
stormed the camp in the night-time, and dispersed the Spanish
force. On his return to the fort on the fifth day he found it
besieged by the Spaniards from the men-of-war; and, after a
 vain attempt to maintain its defence, he succeeded with a few
companions in making his escape in a small vessel. A capitulation
followed, and the Darien colony was no more. Of those who
had taken part in the enterprise only a miserable handful ever
reached their native land.

See J. H. Burton, The Darien Papers (Bannatyne Club, 1849);
Macanlay, History of England (London, 1866); and A. Lang, History of Scotland,
vol. iv. (Edinburgh, 1907).

DARIUS (Pers. Darayavoush; Old Test. Daryatehs),
the name of three Persian kings.
1. Darius the Great, the son of Hystaspes (q.v.),
the principal source for his history is his own inscriptions, especially
the great inscription of Behistun (q.v.), in which he relates how he
annexed the crown and put down the rebellions. In modern times
his veracity has often been doubted, but without any sufficient
reason; the whole tenor of his words shows that we can rely upon
his account. The accounts given by Herodotus and Ctesias of
his accession are in many points evidently dependent on this
official version, with many legendary stories interwoven, e.g.
that Darius and his allies left the question as to which of them
should become king to the decision of their horses, and that
Darius won the crown by a trick of his groom.

Darius belonged to a younger branch of the royal family of
the Achaemenidae. When, after the suicide of Cambyses (March
521), the usurper Gaumaata ruled undisturbed over the whole
empire under the name of Bardiya (Smerdis), son of Cyrus, and
no one dared to gainsay him, Darius, "with the help of Ahura
maaza," attempted to regain the kingdom for the royal race.
On his father Hystaspes, his last name, he was alive, but evidently had not the
courage to urge his claims. Assisted by six noble Persians, whose
names he proclaims at the end of the Behistun inscription,
he surprised and killed the usurper in a Median fortress (October
521; for the chronology of these times cf. E. Meyer, Forschungen
zur alten Geschichte, ii. 472 ff.), and gained the crown. But this
sudden change was the signal for an attempt on the part of all
the eastern provinces to regain their independence. In Susiana,
Babylon, Media, Sagartia, Margiana, usurpers arose, pretending
to be of the old royal race, and gathered large armies around them;
and Persia itself Vahyazdata imitated the example of Gaumaata and
was acknowledged by the majority of the people as the true
Bardiya. Darius with only a small army of Persians and Medes
and some trustworthy generals overcame all difficulties, and in
520 and 519 all the rebellions were put down (Babylon rebelled
twice, Susiana even three times), and the authority of Darius
was established throughout the empire.

Darius in his inscriptions appears as a fervent believer in the
true religion of Zoroaster. But he was also a great statesman and
conqueror. To this end his guests had come to an end; the wars
which Darius undertook, like the conquests of his predecessors,
had the purpose of gaining strong natural frontiers for the empire
and keeping down the barbarous tribes on its borders. Thus
Darius subjected the wild nations of the Pontic and Armenian
mountains, and extended the Persian dominion to the Caucasus;
for the same reasons he fought against the Sacae and other
Turanian tribes. But by the organization which he gave to the empire
he became the true successor of the great Cyrus. His
organization of the provinces and the fixing of the tributes is
described by Herodotus iii. 90 ff., evidently from good official
sources. He fixed the coinage and introduced the gold coinage

'Keats, in his famous sonnet beginning:—"'Much have I travelled
in the realms of gold," of which this is the concluding line, inaccurately
substitutes Cortez for Balboa.
of the Daric (which is not named after him, as the Greeks believed, but derived from a Persian word meaning “gold”); in Middle Persian it is called zartig). He tried to develop the commerce of the empire, and sent an expedition down the Kabul and the Indus, led by the Carian captain Scylax of Caryanda, who explored the Indian Ocean from the mouth of the Indus to Suez. He dug a canal from the Nile to Suez, and, as the fragments of a hieroglyphic inscription found there show, his ships sailed from the Nile through the Red Sea by Saba to Persia. He had connexions with Carthage (i.e. the Karkh of the Nakshi Rustam inscr.), and explored the shores of Sicily and Italy. At the same time he attempted to gain the good-will of the subject nations, and for this purpose promoted the aims of his priests. He allowed the Jews to build the Temple of Jerusalem. In Egypt his name appears on the temples which he built in Memphis, Edfu and the Great Oasis. He called the high-priest of Sais, Uzahir, to Susa (as we learn from his inscription in the Vatican), and gave him full powers to reorganize the “house of life,” the great medical school of the temple of Sais. In the Egyptian traditions he is considered as one of the great benefactors and lawgivers of the country (Herod. ii. 110, Dio. i. 95). In similar relations he stood to the Greek sanctuaries (cf. his rescript to “his slave” Godata, the inspector of a royal park near Magnesia, on the Maeander, in which he grants freedom of taxes and forced labour to the sacred territory of Apollo. See Cousin and Deschamps, Bulletin de correspond. hellén., xiii. (1889), 529, and Dittenberger, Syllae inscr. graec., 2); all the Greek oracles in Asia Minor and Europe therefore stood on the side of Persia in the Persian wars and admonished the Greeks to attempt no resistance.

About 512 Darius undertook a war against the Scythians. A great army crossed the Bosporus, subjugated eastern Thrace, and crossed the Danube. The purpose of this war can only have been to attack the nomadic Turanian tribes in the rear and thus to secure peace on the northern frontier of the empire. It was based upon a wrong geographical conception; even Alexander and his Macedonians believed that on the Hindu Kush (which they called Caucasus) and on the shores of the Jaxartes (which they called Tanais, i.e. Don) they were quite near to the Black Sea. Of course the expedition undertaken on these grounds could not but prove a failure; having advanced for some weeks into the Russian steppes, Darius was forced to return. The details given by Herodotus (according to him Darius had reached the Volga!) are quite fantastical; and the account which Darius himself had given on a tablet, which was added to his great inscription in Behistun, is destroyed with the exception of a few words. (See R. W. Macan, Herodotus, vol. ii. appendix 3, G. B. Grundy, Great Persian War, pp. 48-64; J. B. Bury in Classical Review, July 1897.)

By this time the European Greeks were intimately connected with the coasts of Asia Minor, and the opposing parties in the Greek towns were continually soliciting his intervention, Darius did not meddle with their affairs. The Persian wars were begun by the Greeks themselves. The support which Athens and Eretria gave to the rebellious Ionians and Carians made their punishment inevitable as soon as the rebellion had been put down. But the first expedition, that of Mardonius, failed on the cliffs of Mt. Athos (492), and the army which was led into Attica by Datis in 490 was beaten at Marathon. Before Darius had finished his preparations for a third expedition an insurrection broke out in Egypt (486). In the next year Darius died, probably in October 485, after a reign of thirty-six years. He is one of the greatest rulers the east has produced.

2. DARIUS II., OCHUS. Artaxerxes I., who died in the beginning of 459 B.C., was succeeded by his son Xerxes II. But after a month and a half he was murdered by his brother Scydacus, or Sogdianus (the form of the name is uncertain). Against him rose a bastard brother, Ochus, satrap of Hyrkania, and after a short fight killed him, and suppressed by treachery the attempt of his own brother Arsites to imitate his example (Ctesias ap. Phot. 44; Dio. xii. 71, 108; Pausan. vi. 5, 7). Ochus adopted the name Darius (in the chronicles called Nohos, the bastard). Neither Xerxes II. nor Scydacus occurs in the dates of the numerous Babylonian tablets from Nippur; here the dates of Darius II. follow immediately on those of Artaxerxes I. Of Darius II.’s reign we know very little (a rebellion of the Medes in 409 is mentioned in Xenophon, Hellen. i. 2, 19), except that he was quite dependent on his wife Parysatis. In the excerpts from Ctesias some harem intrigues are recorded, in which he played a disreputable part. As long as the power of Athens remained intact he did not meddle in Greek affairs; even the support which the Athenians in 413 gave to the rebel Amorges in Caria would not have roused him (Andoc. iii. 29; Thuc. viii. 28, 54; Ctesias wrongly names his father Pisuthnes in his stead; an account of these wars is contained in the great Lycian stele from Xanthus (in the British Museum), had not the Athenian power broken down in the same year before Syracuse. He gave orders to his satraps in Asia Minor, Tissaphernes and Pharnabazus, to send in the overdue tribute of the Greek towns, and to begin war with Athens; for this purpose they entered into an alliance with Sparta. In 408 he sent his son Cyrus to Asia Minor, to carry on the war with greater energy. In 404 he died after a reign of nineteen years, and was followed by Artaxerxes II.

3. DARIUS III., CODOMANNUS. The eunuch Bagos (q.v.), having murdered Artaxerxes III. in 338 and his son Arsies in 336, raised to the throne a distant relative of the royal house, whose name, according to Justin x. 3, was Codomannus, and who had excelled in a war against the Caudians (cf. Dio. xvii. 5, where his father is called Arsames, son of Ostanes, a brother of Artaxerxes). The new king, who adopted the name of Darius, took warning by the fate of his predecessors, and saved himself from it by forcing Bagos to drink the cup himself. Already in 336 Philip II. of Macedon had sent an army into Asia Minor, and in the spring of 334 the campaign of Alexander began. In the following year Darius himself took the field against the Macedonian king, but was beaten at Issus and in 332 at Arbela. In his flight to the east he was deposed and killed by Bessus (July 330).

The name Darius was also borne by many later dynasts of Persian origin, among them kings of Persia (q.v.), Darius of Media Atropatene who was defeated by Pompeius, and Darius, king of Pontus in the time of Antony. (Ed. M.)

DARJEELING, a hill station and district of British India, in the Bhagpur division of Bengal. The sanatorium is situated 367 m. by rail north of Calcutta. In 1901 it had a population of 16,024. It is the summer quarters of the Bengal government and has a most agreeable climate, which neither exceeds 80° F. in summer, nor falls below 30° in winter. The great attraction of Darjeeling is its scenery, which is un speakably grand. The view across the hills to Kichenjungba discloses a glittering white wall of perpetual snow, surrounded by towering masses of granite. There are several schools of considerable size for European boys and girls, and a government boarding school at Kurseong. The buildings and the roads suffered severely from the earthquake of the 12th of June 1897. But a more terrible disaster occurred in October 1899, when a series of landslips carried away houses and broke up the hill railway. The total value of the property destroyed was returned at £160,000.

The district of Darjeeling comprises an area of 1164 sq. m. It consists of two well-defined tracts, viz. the lower Himalayas to the south of Sikkim, and the tarai, or plains, which extend from the south of these ranges as far as the northern borders of Purnea district. The plains from which the hills take their rise are only 300 ft. above sea-level; the mountains ascend abruptly in spurs of 6000 to 10,000 ft. in height. The scenery throughout the hills is picturesque, and in many parts magnificent. The two chief rivers of the mountain district are the Kichenjunga in Sikkim (28, 156 ft.) and Everest in Nepal (26, 827 ft.), and are visible from the town of Darjeeling. The principal peaks within the district are: Phalut (11, 812 ft.), Subargum (11, 636), Tanglu (10, 848), Situng and Sinhal Pahal (8163). The chief rivers are the Tista, Great and Little Ranjit, Ramman, Mahananda, Balasan and Jalihaka. None of them is navigable in the mountain valleys; but the Tista, after it debouches on the plains, can be navigated by cargo boats of considerable burthen. Bears, leopards and musk deer are found on the higher mountains, deer on the lower ranges, and
a few elephants and tigers on the slopes nearest to the plains. In the lowlands, tigers, rhinoceroses, deer, and wildogs are abundant. A few wolves are also found. Of small game, hares, jungle fowl, peacocks, partridges, snipe, woodcock, wild ducks and geese, and green pigeons are numerous in the tarai, and jungle fowl and pheasants in the hills. The mahseer fish is found in the Tista.

In 1901 the population was 249,117, showing an increase of 13% since 1891, compared with an increase of 43% in the previous decade. The inhabitants of the hilly tract consist to a large extent of Nepali immigrants and of aboriginal highland races; in the tarai the people are chiefly Hindus and Mahomedans. The Lepchas are considered to be the aboriginal inhabitants of the hilly portion of the district. They are a fine, frank race, naturally open-hearted and free-handed, fond of change and given to an out-door life; but they do not seem to improve on being brought into contact with civilization. It is thought that they are now being gradually driven out of the district, owing to the increase of regular cultivation, and to the government conservation of the forests. They have no word for plough in their language, and they still follow the nomadic form of economy. In the town of Darjeeling Lepchas consists a spot of virgin soil, clearing it of forest and jungle by burning, and scraping the surface with the rudest agricultural implements. The productive powers of the land become exhausted in a few years, when the clearing is abandoned, a new site is chosen, and the same operations are carried on de novo. The Lepchas are also the ordinary out-door labourers on the hills. They have no caste distinctions but speak of themselves as belonging to one of nine septs or clans, who all eat together and intermarry with each other. In the upper or northern tarai, along the base of the hills, the Mechs form the principal ethnical feature. This tribe inhabits the deadly jungle with impunity, and cultivates cotton, rice and other ordinary crops, by the jum process described above. The cultivation of tea was introduced in 1856, and is now a large industry. Cinchona cultivation was introduced by the government in 1862, and has since been taken up by private enterprise. There is a coal mine at Daling. The Darjeeling Himalayan railway of 2 ft. gauge, opened in 1879, runs for 36 m. from Siliguri in the plains on the Eastern Bengal line.

The British connection with Darjeeling dates from 1841, when, at the close of the war with Nepal, the British made over to the Sikhim raja the tarai tract, which had been wrested from him and annexed by Nepal. In 1835 the nucleus of the present district of British Sikhim or Darjeeling was created by acession of a portion of the hills by the raja of Sikhim to the British as a sanatorium. A military expedition against Sikhim, rendered necessary in 1850 by the imprisonment of Dr. A. Campbell, the superintendent of Darjeeling, and Sir Joseph Hooker, resulted in the stoppage of the allowance granted to the raja for the cession of the hill station of Darjeeling, and in the annexation of the Sikhim tarai at the foot of the hills and of a portion of the hills beyond. In August 1866 the hill territory east of the Tista, acquired as the result of the Bhutan campaign of 1864, was added to the jurisdiction of Darjeeling.

DARLEY, GEORGE (1795-1849), Irish poet, was born in Dublin in 1795. His parents, who were gentle folks of independent means, emigrated to America, leaving the boy in charge of his grandfather at Springfield, Co. Dublin. He was educated at Trinity College, Dublin, graduating in 1820; but an unfortunate stammer prevented him from going into the church or to the bar, and he established himself in London, where he published his first volume of poems, the Errors of Ecastie, in 1822, and became a regular contributor to The London Magazine. He was intimate with Cary, the translator of Dante, and with Charles Lamb. In 1826 he published under the name of "Grey Penseval" a volume of prose tales and sketches, Labour in Idleness (1826), one of which, "The Enchanted Lyre," is plainly autobiographical. Sylvia, or the May Queen (1827, reprint 1897), a fairy opera, met with no success, but about 1830, he became dramatic and art critic to the Athenaeum. His other works are: Nepenthis (1835, reprint 1897), his most considerable poem; introduction to the works of Beaumont and Fletcher (1840); with two plays, Thomas à Becket (1840), and Ethelstan (1841). He died in London on the 23rd of November 1849.

DARLING, GRACE HORSLEY (1815-1842), British heroine, was born at Bamborough, Northumberland, on the 24th of November 1815. Her father, William Darling, was the keeper of the Longstone (Farne Islands) lighthouse. On the morning of the 7th of September 1838, the "Fforfashire," bound from Hull to Dundee, with sixty-three persons on board, struck on the Farne Islands, forty-three being drowned. The wreck was observed from the lighthouse, and Darling and his daughter determined to try and reach the survivors. They recognized that though they might be able to get to the wreck, they would be unable to return without the assistance of the shipwrecked crew, but they took this risk without hesitation. By a combination of daring, strength and skill, the father and daughter reached the wreck in their cable and brought back four men and a woman to the lighthouse. Darling and two of the rescued men then returned to the wreck and brought off the four remaining survivors. This gallant exploit made Grace Darling and her father famous. The Humane Society at once voted them their gold medal, the treasury made a grant, and a public subscription was organized. Grace Darling, who had always been delicate, died of consumption on the 20th of October 1842.

See Grace Darling, her true story (London, 1880).

DARLING, a river of Australia. It rises in Queensland and flows into New South Wales, forming for a considerable distance the boundary of the two colonies; in its upper reaches it is known as the Barwon, but from Bourke to its junction on the Victorian border with the river Murray, it is called the Darling. Its length is 1160 m., and it has affluents it drains an area of about 200,000 sq. m. During the dry season its course is marked by a series of shallow pools, but during the winter, when it is subject to sudden floods, it is navigable as far as Bourke for steamers of light draft. Excepting a narrow strip on the banks of the river, the country through which it passes is, for the most part, an arid plain.
DARLINGTONIA—DARMESTETER,

835
dated 1783, contains the first mention of Darlington as a
borough, rated at £5, while half a mark was due from the dyers
of cloth. The next account of the town is in Bishop Hatfield’s
Survey (c. 1380), which states that “Engelram Gentill and his
partners hold the borough of Darlington with the profits of the
mills and dye houses and other profits pertaining to the borough
rendering yearly four score and thirteen pounds and six shillings.”
Darlington possesses no early charter, but claimed its privileges
as a borough by a prescriptive right. Until the 10th century it
was governed by a bailiff appointed by the bishop. The mention
of dyers in the Boldon Book and Hatfield’s Survey probably
indicates the existence of woollen manufacture. Before the 19th
century Darlington was noted for the manufacture of linen,
worsted and flax, but it owes its modern importance to the
opening of the railway between Darlington and Stockton on the
27th of September 1825. “Locomotive No. 1,” the first that
ever ran on a public railway, stands in Bank Top station, a
remarkable relic of the enterprise. As part of the palatinate of
Durham, Darlington sent no members to parliament until 1862,
when it was allowed to return one member. The fairs and
markets in Darlington were formerly held by the bishop and
were in existence as early as the 11th century. According to
Leland, Darlington was in his time the best market town in the
bishopric with the exception of Durham. In 1664 the bishop,
finding that the inhabitants of the town had set up a market “in
the season of the year unaccustomed,” i.e. from the fortnight
before Christmas to Whit Monday, prohibited them from con-
tinuing it. The markets and fairs were finally in 1854 purchased
by the local authority, and now belong to the corporation.

DARLINGTONIA (called after William Darlington, an American
botanist), a Californian pitcher-plant, belonging to the order
Sarraceniaceae. There is only one species, D. californica, which
is found at 5000 ft. altitude on the Sierra Nevadas of California,
growing in sphagnum-bogs along with sundews and rushes.

DARLY, MATTHIAS, 18th-century English caricaturist,
designer and engraver. This extremely versatile artist not only
issued political caricatures, but designed ceilings, chimney-
pieces, mirror frames, grandoles, decorative panels and other
mobilary accessories, made many engravings for Thomas
Chippendale, and sold his own productions over the counter.
He was apparently an architect by profession. The first publica-
tion which can be attributed to him with certainty is a coloured
caricature, “The Cricket Players of Europe” (1741). In 1754
he issued A new Book of Chinese Designs, which was intended
to minister to the passing craze for furniture and household decora-
tions in the Chinese style. It was in this year that he engraved
many of the plates for the Director of Thomas Chippendale.
He published from many addresses, most of them in the Strand
or its immediate neighbourhood, and his shop was for a long period
perhaps the most important of its kind in London. In his book
Nollekens and his Times, J. T. Smith, writing of Richard Cosway,
says:—“So ridiculously foppish did he become that Matth.
Darly, the famous caricature print seller, introduced an etching
of him in his window in the Strand as the ‘Macaroni Miniature
painter.’” Darly was for many years a partner with a man
named Edwards, and together they published many political
prints, which were originally issued separately and collected
annually into volumes under the title of Political and Satirical
History. Darly was a member both of the Incorporated Society
of Artists and the Free Society of Artists, forerunners of the
Royal Academy, and to their exhibitions he contributed many
architectural drawings, together with a profile etching of himself
(1775). Upon one of these etchings, published from 39 Strand,
he is described as “Professor of Ornament to the Academy
of Great Britain.” Darly’s most important publication was The
Ornamental Architect or Young Artists’ Instructor (1770–1771),
a title which was changed in the edition of 1773 to A Compleat
Body of Architecture, embellished with a great Variety of Orna-
ments. He also issued Thirty Vases by English, French and
Italian Masters (1767). In addition to his immense mass of
other productions Darly executed many book plates, illustrated
various books and cabinet-makers’ catalogues, and gave lessons
in etching. His skill as a caricaturist brought him into close
personal relations with the politicians of his time, and in 1763
he was instrumental in saving John Wilkes, whose partisan he
was, from death at the hands of James Dunn, who had determined
to kill him. Darly, who described himself as “Liveryman and
block-maker,” issued his last caricature in October 1765, and
as his shop, No. 39 Strand, was let to a new tenant in the following
year, it is to be presumed that he had by that time died, or
become incapable of further work. As a designer of furniture
Darly travelled in a dozen years or so from the extremes of
pseudo-Chinese affectation to classical severity of the type
popularized by the brothers Adam.

DARMESTETER, JAMES (1849–1894), French author and
antiquarian, was born of Jewish parents on the 28th of March
1849 at Château Salins, in Alsace. The family name had
originated in their earlier home of Darmstadt. He was educated
in Paris, where, under the guidance of Michel Bréal and Abel
Berghaigne, he imbibed a love for Oriental studies, to which
a time he entirely devoted himself. He was a man of vast intel-
lectual range. In 1875 he published a thesis on the mythology
of the Zend Avesta, and in 1877 became teacher of Zend at the
École des Hautes Études. He followed up his researches with his
Études iraniennes (1883), and ten years later published a complete
translation of the Zend Avesta, with historical and philological
commentary (3 vols., 1892–1893), in the Annales du musée
Guimet. He also edited the Zend Avesta for Max Müller’s Sacred
Books of the East. Darmesteter regarded the extant texts as far
more recent than was commonly believed, placing the earliest in
the 1st century B.C., and the bulk in the 3rd century A.D. In
1885 he was appointed professor in the Collège de France,
and was sent to India in 1886 on a mission to collect the popular
songs of the Afghans, a translation of which, with a valuable
essay on the Afghan language and literature, he published on
his return. His impressions of English dominion in India

Darlingtonia californica.
The pitcher-like leaves form a cluster, and are 1 to 2 ft. high,
slender, erect, and end in a rounded hooded top, from which
hangs a blade shaped like a fish-tail which guards the entrance
to the pitcher. Insects are attracted to the leaves by the bright
colouring, especially of the upper part; entering they pass down
the narrow funnel guided by downward pointing hairs which also
prevent their ascent. They form a putrefying mass in the bottom
of the pitcher, and the products of their decomposition are
presumably absorbed by the leaf for food.
were conveyed in *Leçons sur l'Inde* (1888). England interested him deeply; and his attachment to the gifted English writer, A. Mary F. Robinson, whom he shortly afterwards married (and who in 1902 became the wife of Professor E. Ducula, director of the Pasteur Institute at Paris), led him to translate her poems into French in 1888. Two years after his death a collection of excellent essays on English subjects was published in English. He also wrote *Le Mahdi depuis les origines de l'Islam jusqu'à nos jours* (1885); *Les Origines de la poésie persane* (1888); *Prophètes d'Israël* (1892), and other books on topics connected with the east; and from 1893 onwards drew up the annual reports of the *Société Asiatique*. He had just become connected with the *Revue de Paris*, when his delicate constitution succumbed to a slight attack of illness on the 19th of October 1894.

His elder brother, Arèsne Darmesteter (1846-1888), was a distinguished philologist and man of letters. He studied under Gaston Paris at the École des Hautes Études, and became professor of Old French language and literature at the Sorbonne. His *Life of Words* appeared in English in 1888. He also collaborated with Adolphe Hatzfeld in a *Dictionnaire général de la langue française* (2 vols., 1895-1900). Among his most important work was the elucidation of Old French by means of the many glosses in the medieval writings of Rashi and other French Jews. His scattered papers on romance and Jewish philology were collected and edited by James Darmesteter as *Arèsne Darmesteter, récits scientifiques et varia* (1898). His valuable *Cours de grammaire historique de la langue française* was edited after his death by E. Muret and L. Sudre (1801-1895; English edition, 1902).

There is a *Biographie de James Darmesteter in the Journal asiatique* (1894, vol. iv. pp. 519-534), and a notice by Henri Cordier, with a list of his writings, in *The Royal Asiatic Society's Journal* (January 1895); see also Gaston Paris, *"James Darmesteter, in Penseurs et poètes* (1896), pp. 1-61.

**DARMSTADT**, a city of Germany, capital of the grand-duchy of Hesse-Darmstadt, on a plain gently sloping from the Odenwald to the Rhine, 21 m. by rail S.E. from Mainz and 17 m. S. from Frankfurt-on-Main. Pop. (1905) 83,000. It is the residence of the grand-duke and the seat of government of the duchy. Darmstadt consists of an old and a new town, the streets of the former being narrow and gloomy and presenting no attractive features. The new town, however, which includes the greater part of the duchy, is an ensemble of squares. Among the latter is the stately Luisenplatz, on which are the house of parliament, the old palace and the post office, and in the centre of which is a column surmounted by the statue of the grand-duke Louis I., the founder of the new town. The square is crossed by the Rhein-strasse, the most important thoroughfare in the city, leading directly from the railway station to the ducal palace.

This last, a complex of buildings, dating from various centuries, but possessing few points of special interest, is surrounded by grounds occupying the site of the old moat. Opposite to it, on the north side, and adjoining the pretty palace gardens, are the court theatre and the armoury, and a little farther west the handsome buildings of the new museum, erected in 1905 and containing the valuable scientific and art collections of the state, which were formerly housed in the palace; a library of 600,000 volumes and 4000 MSS.; a museum of Egyptian and German antiquities, a picture gallery with masterpieces of old German and Dutch schools, a natural history collection and the state archives.

To the right of the entrance to the palace gardens is the tomb of the "great landgrave" Charles Henry, wife of the late grand-duke Louis IX., mounted by a marble urn, the gift of Frederick the Great of Prussia, bearing the inscription *femina sexu, ingenio vir.* To the south of the castle lies the old town, with the market square, the town hall (lately restored and enlarged) and the enlarged church. Of the eight churches (seven Evangelical) only the Roman Catholic is in any way imposing. There are two synagogues.

The town possesses a technical high school, having (since 1900) power to confer the degree of doctor of engineering, and attended by about 2000 students, two gymnasia, a school of agriculture, an artisans' school and a botanical garden. The chemist, Justus von Liebig, was born in Darmstadt in 1803. Among the chief manufactures are the production of machinery, carpets, playing cards, chemicals, tobacco, hats, etc.

The surroundings of Darmstadt are attractive and contain many features of interest. To the east of the town lies the Mathildenhohe, formerly a park and now converted into villa residences. Here are the Alice hospital and the pretty Russian church, built (1896-1899) by the emperor Nicholas II. of Russia in memory of the empress Maria, wife of Alexander II. In the vicinity is the Rosenhohe, with the mausoleum of the ducal house, with the tomb of the grand-duchess Alice, daughter of Queen Victoria of England.

Darmstadt is mentioned in the 11th century, but in the 14th century it was still a village, held by the counts of Katzenelnbogen. It came by marriage into the possession of the house of Hesse in 1479, the male line of the house of Katzenelnbogen having in that year become extinct. The imperial army took it in the Schmalkaldic War, and destroyed the old castle. In 1587, after the death of Philip the Magnanimous, his youngest son George received Darmstadt and chose it as his residence. He was the founder of the line of Hesse-Darmstadt. Its most brilliant days were those of the reign of Louis X. (1790-1830), the last grand-duke, under whom the new town was built.

See Walther, *Darmstadt wie es war und wie es ist* (Darmst. 1865); and Zermín und Wörner, *Darmstadt und seine Umgebung* (Zürich, 1890).

**DARNLEY, HENRY STEWART or STUART, LORD** (1545-1567), earl of Ross and duke of Albany, second husband of Mary, queen of Scots, was the eldest son of Matthew Stewart, earl of Lennox (1516-1571), and through his mother Lady Margaret Douglas (1515-1578) was a great-grandson of the English king Henry VII. Born at Temple Newsam in Yorkshire on the 7th of December 1545, he was educated in England, and his lack of intellectual ability was compensated for by exceptional skill in military exercises. After the death of Francis II. of France in 1560 Darnley was sent into that country by his mother, who hoped that he would become king of England on Elizabeth's death, and who already entertained the idea of his marriage with Mary, queen of Scots, the widow of Francis, as a means to this end. Consequently in 1561 both Lady Margaret and her son, who were English subjects, were imprisoned by Elizabeth; but they were soon released, and Darnley spent some time at the English court before proceeding to Scotland in February 1565. The marriage of Mary and Darnley was now a question of practical politics, and the queen, having nursed her new suitor through an attack of measles, soon made up her mind to wed him, saying he "was the properst and best proportioned long man that ever she saw." The attitude of Elizabeth towards this marriage is difficult to understand. She had permitted Darnley to journey to Scotland, and it has been asserted that she entangled Mary into this union; but on the other hand she and her council declared their dislike of the proposed marriage, and ordered Darnley and his father to repair to London, a command which was disobeyed. In March 1565 there were rumours that the marriage had already taken place, but it was actually celebrated at Holyrood on the 29th of July 1565.

Although Mary had doubtless a short infatuation for Darnley, the union was mainly due to political motives, and in view of the characters of bride and bridegroom it is not surprising that trouble soon arose between them. Contrary to his expectations Darnley did not receive the crown matrimonial, and his foolish and boisterous behaviour, his vicious habits, and his boisterous companions did not improve with time. He was on bad terms with the regent Murray and other powerful nobles, who disliked the marriage and were intriguing with Elizabeth. Scotland was filled with rumours of plot and assassination, and civil war was only narrowly avoided. Unable to take any serious part in affairs of state, Darnley soon became estranged from his wife. He believed that Mary's relations with David Rizzio injured him as a husband, and was easily persuaded to assent to the murder of the Italian, a crime in which he took part. Immediately afterwards, however, flattered and clasped by the queen, he
betrayed his associates to her, and assisted her to escape from Holyrood to Dunbar. Owing to these revelations he was deserted and distrusted by his companions in the murder, and soon lost the queen's favour. In these circumstances he decided to leave Scotland, but a variety of causes prevented his departure; and meanwhile at Craigmillar a band of nobles undertook to free Mary from her husband, who refused to be present at the baptism of his son, James, at Stirling in December 1566. The details of the conspiracy at Craigmillar are not clear, nor is it certain what part, if any, Mary took in these proceedings. The first intention may have been to obtain a divorce for the queen, but it was soon decided that Darnley must be killed. Rumours of the plot came to his ears, and he fled from Stirling to Glasgow, where he fell ill, possibly by poisoning, and where Mary came to visit him. Another reconciliation took place between husband and wife, and Darnley was persuaded to journey with Mary by easy stages to Edinburgh. Apartments were prepared for the pair at Kirk o' Field, a house just inside the city walls, and here they remained for a few days. On the evening of the 9th of February 1567 Mary took an affectionate farewell of her husband, and went to attend some gaieties in Edinburgh. A few hours later, on the morning of the 10th, Kirk o' Field was blown up with gunpowder. Darnley's body was found at some distance from the house, and it is supposed that he was strangled whilst making his escape. The remains were afterwards buried in the chapel at Holyrood.

Much discussion has taken place about this crime, and the guilt or innocence of Mary is still a question of doubt and debate. It seems to have passed in hours of photography to the murder, which was organized by her lover and third husband, Bothwell (g.v.). As the father of King James I., Darnley is the direct ancestor of all the sovereigns of England since 1603. Personally he was a very insignificant character and his sole title to fame is his connexion with Mary, queen of Scots.

For further information, and also for a list of the works bearing on his life, see the article MARY, QUEEN OF SCOTS.

DARRANG, a district of British India, in the province of Eastern Bengal and Assam. It lies between the Bhutan and Daphla Hills and the Brahmaputra, including many islands in the river. The administrative headquarters are at Tezpur. Its area is 3,418 sq. m. It is for the most part a level plain watered by many tributaries of the Brahmaputra. The two subdivisions of Tezpur Mangaldai differ greatly in character. Tezpur is part of Upper Assam and shares in the prosperity which tea cultivation has brought to that part of the valley. In this portion of the district there are still large areas of excellent land awaiting settlement, and the cultivator finds a market for his produce in the flourishing tea-gardens, to which large quantities of coolies are imported every year. In Mangaldai, on the other hand, most of the good rice land was settled about 1880-1890 when the subdivision had a population of 14,6 to the square mile, as against 42 for Tezpur; the soil is not favourable for tea, and the population is stationary or receding. In 1901 the population of the whole district was 337,313, showing an increase of 10% in the decade. The principal grain-crop is rice. The principal means of communication is by river. There is a tramway of 2 1/2 ft. gauge has been opened from Tezpur to Balipat, a distance of 20 miles.

Darrang originally formed, according to tradition, part of the dominions of Bana Raja, who was defeated by Krishna in a battle near Tezpur ("the town of blood"). The massive granite ruins found near by prove that the place must have been the seat of powerful and civilized rulers. In the 16th century Darrang was subject to the dominion of Kamarupa, and its present division of his dominions among his heirs passed to an independent line of rajahs. Early in the 17th century the raja Bali Narayan invoked the aid of the Ahoms of Upper Assam against the Musulman invaders; after his defeat and death in 1637 the Ahoms dominated the whole district, and the Darrang rajas sank into petty feudatories. About 1755 they took advantage of the decay of the Ahom kingdom to try and re-establish their independence, but they were defeated by a British expedition in 1792, and in 1826 Darrang, with the rest of Assam, passed under British control.

DARTMOORD, a market town in the Dartford parliamentary division of Kent, England, on the Darent, 17 m. E.S.E. of London by the South-Eastern & Chatham railway. Pop. of urban district (1891), 11,062; (1901) 18,644. The town lies low, flanked by two chalky eminences, called East and West Hills. It possesses a town hall, a grammar school (700), and a Martyr Memorial Hall. The most noteworthy building is the parish church, restored in 1865, which contains a curious old fresco and several interesting brasses, and has a Norman tower. The prosperity of the town depends on the important works in its vicinity, including powder works, paper mills, and engineering, iron, chemical and cement works. One of the first attempts at the manufacture of paper in England was made here by Sir John Spielman (d. 1607), jeweller to Queen Elizabeth. Dartford was the scene, in 1235, of the marriage, celebrated by proxy, between Isabella, sister of Henry III., and the Emperor Frederick II.; and in 1331 a famous tournament was held in the place by Edward III. The same monarch established an Augustinian nunnery on West Hill in 1355, of which, however, few remains exist. After the Dissolution it was used as a private residence by Henry VIII., Anne of Cleves and Elizabeth. The chantry of St Edmund the Martyr which stood on the opposite side of the town was a part of Edward III.'s endowment to the priory, and became so famous as a place of pilgrimage, especially for those on their way to Canterbury, that the part of Watling Street which crossed there towards London was sometimes called "St Edmund's Way." It was here also that Wat Tyler's insurrection began in 1381, and the house in which he resided is shown. Dartford Heath is a lunatic asylum of the London County Council, and, at Long Reach, the infectious diseases hospital of the Metropolitan Asylums Board. Stone church, 2 m. E. of Dartford, mainly late Early English (1251-1274), and carefully restored by G. E. Street in 1860, is remarkable; the richness of the work within increases from west to east, culminating in a choir arcade decorated with work among the finest of its period extant; the period is that of the choir of Westminster Abbey, and from a comparison of building materials, choir arcades and sculpture of foliage, a common architect has been suggested. Greenhithe, on the banks of the Thames, has large chalk quarries in its neighbourhood, from which lime and cement are manufactured.

DARTMOOR, a high plateau in the south-west of Devonshire, England. Its length is about 23 m. from N. to S. and its extreme breadth 20 m., the mean altitude being about 1,500 ft. The area exceeding 1,000 ft. in elevation is about 200 sq. m. It is the highest and easternmost in a broken chain of granitic elevations which extends through Cornwall to the Scilly Isles. The higher parts are open, bleak and wild, strongly contrasting with the more gentle scenery of the well-wooded lowlands surrounding it. The hilly heights rise in the main parallel in all directions, crested with broken masses of granite, low precipices, and often singularly fantastic in outline. The highest of these are Yes Tor and High Willhays in the north-west, reaching altitudes of 2,028 and 2,039 ft. Large parts of the moor, especially in the centre, are covered with morasses; and head-waters of all the principal streams of Devonshire (g.v.) are found here. Two main roads cross the moor, one between Exeter and Plymouth, and the other between Ashburton and Tavistock, intersecting at Two Bridges. Both avoid the higher part of the moor, which, for the rest, is traversed only in part by a few rough tracks. The central part of Dartmoor was a royal forest from a date unknown, but apparently anterior to the Conquest. Its woods were formerly more extensive than now, but a few small tracts in which dwarf oaks are characteristic remain in the lower parts. Previous to 1337, the forest had been granted to Richard, earl of Cornwall, by Henry III., and from that time onward it has belonged to the dukedom of Cornwall. The districts immediately surrounding the moor are called the Vennell or Fenfield districts. The origin of this name is not clear. The holders of land by Vennell tenure under the duke have rights of pasture, fishing, &c. in the forest, and their main duty is to drive the moor at certain times in order to ascertain what head of cattle are pastured thereon, and to prevent trespassing. The antiquarian remains of Dartmoor are considered among those of Devonshire. Dartmoor convict prison, near Princetown, was adapted to its present purpose in 1850; but the original buildings were erected
in 1809 for the accommodation of French prisoners. A tract of
moorland adjacent to the prison has been brought under cul-
tivation by the inmates.

See Row, Perambulation of the... forest of Dartmoor (Plymouth, 1848); J. L. W. Page, Exploration of Dartmoor (London, 1886); S. Barings-Gould, Book of Dartmoor (London, 1900).

DARTMOUTH, a town in Halifax county, Nova Scotia, Canada, on the north-eastern side of Halifax harbour, connected by a steam ferry with Halifax, of which it is practically a suburb. Pop. (1901) 4866. It contains a large sugar refinery, foundries, machine shops, saw mills, skate, rope, nail, soap and sash factories.

DARTMOUTH, a seaport, market town, and municipal borough in the Torquay parliamentary division of Devonshire, England, 27 m. E. of Plymouth. Pop. (1901) 6759. It is beautifully situated on the west bank and near the mouth of the river Dart, which here forms an almost land-locked estuary. The town is connected by a steam ferry with Kingswear on the opposite bank, which is served by a branch of the Great Western railway. The houses of Dartmouth, many of which are ancient, rise in tiers from the shore, beneath a range of steep hills. An embankment planted with trees fronts the river. The cruciform church of St Saviour is of the 14th and 15th centuries, and contains a graceful rood-screen of the 16th century, an ancient stone pulpit and interesting monuments. Dartmouth Castle, in part of Tudor date, commands the river, and is a mile from the town.

In the vicinity of the city of the Newcomen, one of the inventors of the steam-engine, are preserved. Dartmouth is a favourite yachting centre, and shipbuilding, brewing, engineering and paint-making are carried on. Coal is imported, and resold to ships calling at the harbour. The borough is under a mayor, four aldermen and twelve councillors. Area, 1924 acres.

History.—Probably owing its origin to Saxon invaders, Dartmouth (Darentamuthan, Derlemou) was a seaport of importance when Earl Beorn was buried in its church in 1049. From its sheltered harbour William II. embarked for the relief of Mans, and the crusading squadron set sail in 1190, while John landed here in 1214. The borough, first claimed as such in the reign of Henry I., was in existence by the middle of the 13th century, since a deed of Gilbert Fitz-Stephen, lord of the manor, mentions the services due from "his burgesses of Dartemou," and a borough seal of 1280 is extant. The king in 1224 required the bailiffs and good men of Dartmouth to keep all ships in readiness for his service, and in 1302 they were to furnish two ships for the Scottish expedition, an obligation maintained throughout the century. The men of the ville were made quit of toll in 1337, and in 1342 the town was incorporated by a charter frequently confirmed by later sovereigns. Edward III. in 1372 granted that the burgesses should be sued only before the mayor and bailiffs, and Richard II. in 1393 granted extended jurisdiction and a coroner; further charters were obtained in 1604 and 1684. A French attack on the town was repulsed in 1404, and in 1485 the burgesses received a royal grant of £40 for wailing the town and stretching a chain across the river mouth. Dartmouth fitted out two ships against the Armada, and was captured by both the royalists and parliamentarians in the Civil War. It returned two representatives to parliament in 1598, and from 1650 to 1832. In the latter year the representation was reduced to one, and was merged in that of the county in 1868. Manorial courts were granted for Dartmouth in 1231 and 1301. These were important since as early as 1225 the fleet resorted there for provisions. During the 14th and 15th centuries there was a regular trade with Bordeaux and Brittany, and complaints of piracies by Dartmouth men were frequent.

DARTMOUTH COLLEGE, an American institution of higher education, in Hanover, New Hampshire. It is Congregational in its affiliations, but is actually non-sectarian. The college is open only to men except during the summer session, when women also are admitted. Dartmouth embraces, in addition to the original college, incorporated in 1769, a medical school, dating from the establishment of a professorship of medicine in the college in 1798; the Thayer school of civil engineering, established in 1867 by the bequest of Gen. Sylvanus Thayer; and the Amos Tuck school of administration and finance, established in 1906 by Edward Tuck—a remarkable feature, as it was the first, and, until the establishment at Harvard of a similar graduate school, the only commercial school in the country whose work is largely post-graduate. The Chauncy school of science and the arts was founded by Abiel Chandler in 1851, in connexion with Dartmouth, and was incorporated into the collegiate department in 1893 as the Chauncy scientific course in the college. From 1866 to 1893 the New Hampshire college of agriculture and the mechanic arts, now at Durham, was connected with Dartmouth. The medical school offers a four years' course, and each of the other two professional schools a two years' course, the first year of which may, under certain conditions, be counted as the senior year of the undergraduate department. The college has a beautiful campus or "yard"; a library of more than 100,000 volumes, housed in Wilson Hall (1885); instruction halls, residence halls—Thornton and Wentworth (1828), Hallington (1874), Richardson (1897), and Fayerweather (1900); a gymnium (Bissell Hall, built in 1867); an athletic field, known as Alumni Oval; Bartlett Hall (1890—1891), the house of the College Young Men's Christian Association; Rolls Chapel (1885); College Hall (1901), a social headquarters; an astronomical and meteorological observatory (Shattuck Observatory, 1884); the Mary Hitchcock hospital (1893), associated with the medical college; museums (Shattuck Scientific Hall, built 1856, and Wilson Hall, built 1871); the chemical laboratory; and Wilder Hall (1899), the physical laboratory. The college in 1908 had 300 officers of administration and instruction and 1249 students. It is maintained chiefly by the proceeds of a productive endowment fund amounting to $2,700,000 and by tuition fees ($125 a year for each student). The government is entrusted to a board of twelve trustees, five of whom are elected upon the nomination of the alumni.

Dartmouth is the outgrowth of Moor's Indian charity school, founded by Eleazer Wheelock (1711—1779) about 1750 at Lebanon, Connecticut; this school was named in 1755 in honour of Joshua Moor, who in this year gave to it lands and buildings. In 1765 Samson Occom (c. 1723—1792), an Indian preacher and former student of the school, visited England and Scotland in its behalf and raised £10,000, whereupon plans were made for enlargement and for a change of site to Hanover. In 1769 the school was incorporated by a charter granted by George III. as Dartmouth College, being named after the earl of Dartmouth, president of the trustees of the funds raised in Great Britain. The first college building, Dartmouth Hall (closely resembling Nassau Hall at Princeton and the University Hall of Brown University), was built in 1784—1791 and is still standing, as are the typical college church, built in 1796 and enlarged in 1827 and 1886, and Moor Hall, the second building for Moor's charity school, since 1892 called the Chandler building. During the War of Independence the support from Great Britain was mostly withdrawn. In 1815 President John Wheelock (1754—1817), who had succeeded his father in 1779, and was a Presbyterian and a Republican, was removed by the majority of the board of trustees, who were Congregationalists and Federalists, and Francis Brown was chosen in his place. Wheelock, upon his appeal to the legislature, was reinstated at the head of a new corporation, called Dartmouth University. The state courts upheld the legislature and the "University," but in 1816 after the famous argument of Daniel Webster (q.v.) in behalf of the "College" board of trustees as against the "University" board before the United States Supreme Court, that body decided that the private trust created by the charter of 1769 was inviolable, and Dr Francis Brown and the old "College" board took possession of the institution's property. This was one of the most important decisions ever made by the United States Supreme Court.

Boston, 1884); and Joseph Story, Commentaries on the Constitution (vol. ii., Boston, 1891).
DARTMOUTH, EARL OF-DARU, COUNT

Legge of Lewisham, keeper of foreign ports, in 1642. During the war Legge distinguished himself at Chalgrove and at the first battle of Newbury, and in 1643 he became governor of Oxford. However, he only held this position for a few months, as he shared the disgrace of Prince Rupert, to whom he was very devoted; but he was largely instrumental in putting an end to the quarrel between the king and the prince. Legge helped Charles to escape from Hampton Court in 1647, and after attending upon him he was arrested in May 1648. He was soon released, but was again captured in the following year while proceeding to Ireland in the interest of Charles II. Regaining his freedom in 1653, he spent some years abroad, but in 1660 he was once more in England inciting the royalists to rise. Legge enjoyed the favour of Charles II., who offered to make him an earl. He died on the 13th of October 1670.

Legge's eldest son, George, Baron Dartmouth (1647-1691), served as a volunteer in the navy during the Dutch war of 1665-1667, and quickly won his way to high rank. He was also a member of the household of the duke of York, afterwards James II.; was governor of Portsmouth and master-general of the army; in 1678 he commanded as colonel the troop at Nieuport, and in 1685 he was created Baron Dartmouth. In 1683 as "admiral of a fleet" he sailed to Tangiers, dismantled the fortifications and brought back the English troops, a duty which he discharged very satisfactorily. Under James II. Dartmouth was master of the horse and governor of the Tower of London; and in 1688, when William of Orange was expected, James II. made him hereditary-in-chief of his fleet. Although himself loyal to James, the same cannot be said of many of his officers, and an engagement with the Dutch fleet was purposely avoided. Dartmouth, however, refused to assist in getting James Edward, prince of Wales, out of the country, and even reproved the king for attempting this proceeding. He then left the fleet and took the oath of allegiance to William and Mary, but in July 1691 he was arrested for treason, and was charged with offering to hand over Portsmouth to France and to command a French fleet. Macaulay believed that this accusation was true, but there are those who hold that Dartmouth spoke the truth when he protested his innocence. Further proceedings against him were prevented by his death, which took place in the Tower of London on the 25th of October 1691.

Lord Dartmouth's only son, William, 1st Earl of Dartmouth (1672-1750), succeeded to his father's barony in 1691. In 1702 he was appointed a member of the board of trade and foreign plantations, and eight years later he became secretary of state for the southern department and joint keeper of the signet for Scotland. In 1711 he was created viscount Lewisham and earl of Dartmouth; in 1713 he exchanged his offices for that of keeper of the privy seal, which he held until the end of 1714. After a long period of retirement from public life he died on the 15th of December 1750. Dartmouth's eldest son George, viscount Lewisham (c. 1703-1732), predeceased his father. Other sons were: Henage Legge (1704-1759), judge of the court of exchequer; Henry Legge (q.v.), afterwards Bilson-Legge; and Edward Legge (1710-1747), who served for some time in the navy and died on the 19th of September 1747.

William, 2nd Earl of Dartmouth (1732-1801), was a son of George, viscount Lewisham, and a grandson of the 1st earl, whom he succeeded in 1750. For a few months in 1765 and 1766 he was president of the board of trade; in 1773 he returned to the same office holding also that of secretary for the colonies; and in 1775 he became lord privy seal. With regard to the American colonies Dartmouth advised them in 1777 to accept the conciliatory proposals put forward by Lord North, but in 1776 he opposed similar proposals and advocated the employment of force. In March 1783 he resigned his office as lord privy seal and in 1785 he was lord steward of the household; he died on the 15th of July 1801.

Dartmouth was a friend of Selina, countess of Huntingdon, and his piety and his intimacy with the early Methodists won for him the epithet of the Psalm-singer. Dartmouth College was named after him, and among his papers preserved at Patshull House, Wolverhampton, are many letters from America relating to the struggle for independence. His sixth son, Sir Arthur Kaye Legge (d. 1835), was an admiral of the blue, and his seventh son, Edward Legge (d. 1827), was bishop of Oxford.

George, 3rd Earl of Dartmouth (1755-1810), the eldest son of the 2nd earl, was lord warden of the stannaries and president of the board of control; later he was lord steward and then lord chamberlain of the royal household. He died on the 1st of November 1810, when his eldest son, William (1784-1853), became 4th earl. William's son, William Walter (1823-1861), became 5th earl in 1853 and was succeeded in 1881 by his son William Henegan Legge (b. 1851) as 6th earl of Dartmouth. As Lord Lewisham this nobleman was a member of parliament from 1873 to 1891, and was vice-chamberlain of the household in 1885-1886, and again from 1896 to 1892.

DARU, PIERRE ANTOINE NOËL BRUNO, COUNT (1767-1820), French soldier and statesman, was born at Montpellier on the 12th of January 1767. He was educated at the military school of Tournon, conducted by the Oratorians, and entered the artillery at an early age. His fondness for literature, however, soon made itself felt, and he published several slight pieces, until the outbreak of the French Revolution called him to a stern occupation. In 1793 he became commissary to the army, protecting the coasts of Britain from projected descents of the British, or of French royalists. Thrown into prison on a frivolous charge of friendliness to the royalists and England, he was released after the fall of Robespierre in the summer of 1794, and rose in secret until, in 1796, he became chief commissary to the French army serving under Massena in the north of Switzerland. In that position he won repute for his organizing capacity, great power of work and unsurprising probity—the last of which qualities was none too common in the French armies at that time. These exacting tasks did not absorb all his energies. He found time, even during the campaign, to translate part of Horace and to compose two poems, the Poème des Alpes and the Chant de guerre. The latter celebrated in indignant strains the murder of the French envoy to the congress of Rastadt.

The accession of Napoleon Bonaparte to power in November 1799 led to the employment of Daru as chief commissary to the Army of Reserve intended for North Italy, and commanded nominally by Berthier, but really by the First Consul. Conjointly with Berthier and Dejean, he signed the armistice with the Austrians which closed the campaign in North Italy in June 1800. Daru maintained a force for a time, mainly to civil life, and entered the tribunate, where he mainly maintained the principles of democratic liberty. On the renewal of war with England, in May 1803, he again resumed his duties as chief commissary for the army on the northern coasts. It was afterwards asserted that, on Napoleon's resolve to turn the army of England against Austria, Daru had set down at the emperor's dictation all the details of the campaign which culminated at Ulm. The story is apocryphal; but Napoleon's confidence in him was evinced by his being appointed to similar duties in the Grand Army, which in the autumn of 1805 overthrew the armies of Austria and Russia. After the battle of Austerlitz, he took part in the drafting of the treaty of Presburg. At this time, too, he became intendant-general of the military household of Napoleon. In the campaigns of 1806-1807 he served in his usual capacity, in the army which on its way to defeat the forces of Russia and Prussia; and he had a share in drawing up the treaty of Tilsit (7th of July 1807). After this he supervised the administrative and financial duties connected with the French army which occupied the principal fortresses of Prussia, and was one of the chief agents through whom Napoleon pressed hard on that land. At the congress of Erfurt, Daru had
the privilege of being present at the interview between Goethe and Napoleon, and interposed tactful references to the works of the great poet. Daru fulfilled his usual duties in the campaign of 1809 against Austria. Afterwards, when the subject of the divorce of Josephine and the choice of a Russian or of an Austrian princess came to be discussed, Daru, on being consulted by Napoleon, is said boldly to have counselled his marriage with a French lady; and Napoleon, who admired his frankness and honesty, took the reply in good part.

In 1811 he became secretary of state in succession to Maret, duc de Bassano, and showed his usual ability in the administration of the vast and complex affairs of the French empire, including the arrangements connected with the civil list and the imperial domains. But neither his devotion to civic duty nor to the administration of the affairs of the Grand Army could ward off disaster. Late in the year 1813 he took up the portfolio of military affairs. After the first abdication of Napoleon in 1814, Daru retired into private life, but aided Napoleon during the Hundred Days. After the second Restoration he became a member of the Chamber of Peers, in which he ably defended the cause of popular liberty against the attacks of the ultra-royalists. He died at Meulan on the 5th of September 1820.

Excellency to the French empire have been more generally admired and respected than Daru. On one occasion when he expressed a fear that he lacked all the gifts of a courtier, Napoleon replied, "Courtiers! They are common enough about me; I shall never be in want of them. What I want is an enlightened, firm and vigilant administrator; and that is why I have chosen you." At another time Napoleon said, "Daru is good on all sides; he has good judgment, a great intellect, a great power for work, and a body and mind of iron." The only occasion on which he is known to have sunk beneath the weight of his duties was in the course of writing letters at the emperor's dictation for the third night in succession.

Of Daru's literary works may be mentioned his Histoire de Venise, published at Paris in 7 vols. in 1819; the Histoire de Bretagne, in 3 vols. (Paris, 1826); a poetical translation of Horace (of which Le Brun remarked: "Je ne lis point Daru, j'aime trop mon Horace"); Discours en vers sur les facultés de l'homme (Paris, 1825); and Astronomie, a didactic poem in six cantos (Paris, 1822).

See the "Notice" by Viennet prefixed to the fourth edition of Daru's Histoire de la république de Venise (9 vols., 1853), and three articles by Sainte-Beuve in Contes et devises, vol. ix. For the many letters of Napoleon to Daru see the Correspondance de Napoléon 1er (32 vols., Paris, 1858-1870).

DARWEN, a municipal borough in the Darwen parliamentary division of Lancashire, England, 20 m. N.W. from Manchester by the Lancashire & Yorkshire railway. Pop. (1891) 34,192; (1901) 38,212. It lies on the river Darwen, which traverses a densely populated manufacturing district, and is surrounded by high-lying moors. Darwen is a centre of the cotton trade and has also blast furnaces, and paper-making, paper-staining and fire-clay works. In the neighbourhood are collieries and stone quarries. The market hall is the chief public building; there are technical schools, a free library, and two public parks. Darwen was incorporated in 1833. The corporation consists of a mayor, six aldermen and eighteen councillors.

DARWIN, CHARLES ROBERT (1809-1882), English naturalist, author of the Origin of Species, was born at Shrewsbury on the 12th of February 1809. He was the younger of the two sons and the fourth child of Dr Robert Waring Darwin, son of Dr Erasmus Darwin (q.v.). His mother, a daughter of Josiah Wedgwood (1730-1795), died when Charles Darwin was eight years old. Charles Darwin's elder brother, Erasmus Alvey (1804-1881), was interested in literature and art rather than science: on the subject of the wide difference between the brothers Charles wrote that he was "inclined to agree with Francis Galton in believing that education and environment produce only a small effect on the mind of anyone, and that most of our qualities are innate" (Life and Letters, London, 1857, p. 22). Darwin considered that his own success was chiefly due to "the love of science, unbounded patience in long reflecting over any subject, industry in observing and collecting facts, and a fair share of invention as well as of common sense" (I.c. p. 107). He also says: "I have steadily endeavoured to keep my mind free so as to give up any hypothesis, however much beloved (and I cannot resist forming one on every subject), as soon as facts are shown to be opposed to it" (I.c. p. 103). The essential causes of his success are to be found in this latter sentence, the creative genius ever inspired by existing knowledge to build hypotheses by whose aid further knowledge could be won, the calm unbiassed mind, the transparent honesty and love of truth which enabled him to abandon or to modify his own creations when they ceased to be supported by observation. The even balance between these powers was as important as their remarkable development. The great naturalist appeared in the ripeness of time, when the world was ready for his splendid generalizations. Indeed naturalists were already everywhere considering and discussing the problem of evolution, although Alfred Russel Wallace was the only one who, independently of Darwin, saw his way clearly to the solution. It is true that hypotheses essentially the same as natural selection were suggested much earlier by C. H. J. de Blainville (1788-1857), and Patrick Matthew (Naval Timber and Arboriculture, 1831), but their views were lost sight of and produced no effect upon the great body of naturalists. In the preparation for Darwin Sir Charles Lyell's Principles of Geology played an important part, acquainting men's minds to the vast changes brought about by natural processes, and leading them, by its lucid and temperate discussion of Lamarck's and other views, to reflect upon evolution.

Darwin's early education was conducted at Shrewsbury, first for a year at a day-school, then for seven years at Shrewsbury School under Dr Samuel Butler (1774-1839). He gained but little from the narrow system which was then universal. In 1825 he went to Edinburgh to prepare for the medical profession, for which he was un fitted by nature. After two sessions his father realized this, and in 1828 sent him to Cambridge with the idea that he should become a clergyman. He matriculated at Christ's College, and took his degree in 1831, tenth in the list of those who do not seek honours. Up to this time he had been keenly interested in botany, especially in entomology, especially the collecting of beetles. Both at Edinburgh, where in 1826 he read his first scientific paper, and at Cambridge he gained the friendship of much older scientific men—Robert Edmund Grant and William Macgillivray at the former, John Stevens Henslow and Adam Sedgwick at the latter. He had two terms' residence to keep after passing his last examination, and studied geology with Sedgwick. Returning from their geological excursion together in North Wales (August 1831), he found a letter from Henslow urging him to apply for the position of naturalist on the "Beagle," about to start on a surveying expedition. His father at first disliked the idea, but his uncle, the second Josiah Wedgwood, pleaded with success, and Darwin started on the 27th of December 1831, the voyage lasting until the 2nd of October 1836. It is practically certain that he never left Great Britain after this latter date. After visiting the Cape de Verde and other islands of the Atlantic, the expedition surveyed on the South American coasts and adjacent islands (including the Galapagos), afterwards visiting Tahiti, New Zealand, Australia, Tasmania, Keeling Island, Maldives, Mauritius, St Helena, Ascension; and Brazil, Cape de Verdes and Azores on the way home. His work on the geology of the countries visited, and that on coral islands, became the subject of volumes which he published after his return, as well as his Journal of a Naturalist, and his other contributions to the official narrative. The voyage must be regarded as the real preparation for his life-work. His observations on the relation between animals in islands and those of the nearest continental areas, near akin and yet not the same, and between living animals and those most recently extinct and found fossil in the same country, here again related but not the same, led him even then to reflect deeply upon the modification of species. He had been also much impressed by "the manner in which closely allied animals replace one another in proceeding southwards" in South America. On his return home Darwin worked at his
collections, first at Cambridge for three months and then in London. His pocket-book for 1837 contains the words: “In July opened first note-book on Transmission of Species. Had been greatly struck from about the month of previous March [while still on the voyage and just over twenty-eight years old] on character of South American fossils, and species on Galapagos Archipelago. These facts (especially latter) origin of all my views.” From 1838 to 1841 he was secretary of the Geological Society, and saw a great deal of Sir Charles Lyell, to whom he dedicated the second edition of his Journal. On the 29th of January 1839 he married his cousin, Emma Wedgwood, the daughter of Josiah Wedgwood of Maer. They lived in London until September 1842, when they moved to Down, which was Darwin’s home for the rest of his life. His health broke down many times in London, and remained precarious during the whole of his life. The immense amount of work which he got through was only made possible by the loving care of his wife. For eight years (1846 to 1854) he was chiefly engaged upon four monographs on the recent and fossil Cirripedia Crustacea (Ray Soc., 1851 and 1854; Palaeontograph. Soc., 1851 and 1854). Towards the close of this work Darwin became very weary of it, especially during his last year, and in a foolish manner, which should discourage the habit of appending the name of the describer to the name of the species, a custom which he thought led to bad and superficial work. From this time he was engaged upon the numerous lines of inquiry which led to the great work of his life, the *Origin of Species*, published in November 1859.

Soon after opening his note-book in July 1837 he began to collect facts bearing upon the formation of the breeds of domestic animals and plants, and quickly saw “that selection was the keystone of man’s success. But how selection could be applied to organisms living in a state of nature remained for some time a mystery to me.” Various ideas as to the causes of evolution occurred to him, only to be successively abandoned. He had the idea of “laws of change” which affected species and finally led to their extinction, to some extent analogous to the causes which bring about the development, maturity, and finally death of an individual. He also had the conception that species must give rise to other species or else die out, just as an individual dies unrepresented if it bears no offspring. These and other ideas, of which traces appear in his Diary, and in his mind, both connected with perhaps some general conception of natural selection, during the fifteen months after the opening of his note-book. In October 1838 he read *Malthus on Population*, and his observations having long since convinced him of the struggle for existence, it at once struck him “that under these circumstances favourable variations would tend to be preserved, and unfavourable ones to be destroyed. The result of this would be the formation of new species. Here, then, I had a theory by which to work.” In June 1842 he wrote out a sketch, which two years later he expanded to an essay occupying 315 pages. The idea of progressive divergence as an advantage in itself, because the competition is most severe between organisms most closely related, did not occur to him until long after he had come to Down. During the growth of the *Origin* Sir Joseph Hooker was his most intimate friend, and on the 11th of January 1844 he wrote: “At last gleams of light have come, and I am almost convinced (quite contrary to the opinion I started with) the species are not (it is like confessing a murder)” (l.c. ii. 13). In 1855 he began a correspondence with the great American botanist Asa Gray, and in 1857 explained his views in a letter which afterwards became classical. In 1856, urged by Lyell, he began the preparation of a third and far more expanded treatise, and had completed about half of it when, on the 18th of June 1858, he received a manuscript essay from A. R. Wallace, who was then at Ternate in the Moluccas. Wallace wanted Darwin’s opinion on the essay, which he asked should be forwarded to Lyell. Darwin was much startled to find in the essay a complete abstract of his own theory of natural selection. He forwarded it the same day, writing to Lyell, “your words have come true with a vengeance—that I should be forestalled.” He placed himself in the hands of Lyell and Hooker, who decided to send Wallace’s essay to the Linnean Society, together with an abstract of Darwin’s work, which they asked him to prepare, the joint essay being accompanied by a preface in the form of an explanatory letter written by them to the secretary. The title of the joint communication was “On the Tendency of Species to form Varieties; and on the Perpetuation of Varieties and Species by Natural Means of Selection.” It was read on the 1st of July 1858, and appears in the *Linn. Soc. Journal (Zoology)* for that year. In this statement of the theory of natural selection, Darwin’s part consisted of two sections, the first being extracts from his 1834 essay, including a brief account of sexual selection, and the second an abstract of his letter to Asa Gray dated the 5th of September 1857. This latter, probably his first attempt to expound natural selection, cannot be surpassed as a clear statement of the theory. Darwin explained at the outset, what he insisted on elsewhere, that the facts of adaptation or contrivance in nature are the real difficulty to be explained by at theory of evolution, the stumbling-block of every previous suggestion. Until he could explain “the mistletoe, with its pollen carried by insects, and seed by birds—the woodpecker, with its feet and tail—a few and tongue, to climb the tree and secure insects,” he was “scientifically dead.” Unless he was led to believe in evolution, apart from any possible motive-cause, by “general facts in the affinities, embryology, rudimentary organs, geological history, and geographical distribution of organic beings.” He then proceeds to describe the manner in which he met the difficulty of adaptation by “his notions on the means by which Nature makes her species.” The essentials of the statement are as follows:—I. Man has made his domestic breeds of animals and plants by selection, conscious or unconscious, of very slight or greater variations. II. The material for selection exists in nature, namely, slight variations of all parts of the organism. III. The “unerring power” which sifts these variations is “natural selection . . . which selects exclusively for the good of each organic being.” The rate of increase is such that only a few in each generation can live: hence the never sufficiently appreciated struggle for life. What a trifling difference must often determine which shall survive and which perish. The remaining heads explain the complex nature of the struggle, the reasons for deficient direct evidence, the advantage of divergence, &c. In the joint essay they give “natural selection” and “sexual selection” were first made public by Darwin, the “struggle for existence” by Wallace. Darwin and Wallace had met only once before the departure of the latter for the East. Their rivalry in the discovery of the great principle of natural selection was the beginning of a lifelong friendship. Wallace was lying ill with intermittent fever at Ternate in February 1858 when he began to think of Malthus’s *Essay on Population*, read several years before: suddenly the idea of the survival of the fittest flashed upon him. In two hours he had “thought out almost the whole of the theory,” and in three evenings had finished his essay. Darwin, also inspired after reading Malthus, in October 1838, did not publish until nearly twenty years had elapsed, and then only when Wallace sent him his essay. Canon H. B. Tristram was the first to apply the new theory, explaining by its aid the colours of desert birds, &c. (Ib., October 1859.) On advice of Lyell and Hooker, Darwin then began to prepare what was to become the great work of his life. It appeared on the 24th of November 1859, with the full title, *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life.* The whole edition of 1250 copies was exhausted on the day of issue. The five first chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence. The fifth chapter deals with the laws of variation and causes of modification other than natural selection. The five succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection. The three remaining chapters (omitting the recapitulation which occupies the last) deal with the evidence for evolution. The theory which suggested a cause of evolution is thus given the foremost place.
and the evidence for the existence of evolution considered last of all. This method of presentation was no doubt adopted because it was just the want of a reasonable motive-cause which more than anything else prevented the acceptance of evolution. But the other side of the book must not be eclipsed by the brilliant theory of Darwin and Wallace. The evidence for evolution itself had never before been thought out and marshalled in a manner which bears any comparison with that of Darwin in the Origin, and the work would have been in the highest degree epoch-making had it consisted of the later chapters alone. In the fifth chapter Darwin incorporated a certain proportion of the doctrines of Buffon,—modifications due to the direct influence of environment; and of Lamarck,—the hereditary effects of use and disuse. Lyell for a long time hesitated to accept the new teaching, and Darwin carried on a long correspondence with him. His public confession of faith was made at the anniversary dinner of the Royal Society in 1854. A storm of controversy arose over the book, reaching its height at the meeting of the British Association at Oxford in 1860, when the celebrated duel between T. H. Huxley and Bishop Wilberforce took place. Throughout these struggles Huxley was the foremost champion, and for a long time was accepted as the naturalist, although he never entirely accepted the latter theory, holding that until man by his selection had made his domestic breed sterile inter se, there was no sufficient evidence that selection accounts for natural species which are thus separated by the barrier of sterility. The theory of natural selection was at first greatly misunderstood. Thus some writers thought it implied conscious choice in the animals themselves, others that it was the personification of some active power. By many it was thought to be practically the same idea as Lamarck's. Herbert Spencer's alternative phrase, "the survival of the fittest," probably helped to spread a clear appreciation of Darwin's meaning.

The history of opinion since 1859 may be summed up as follows. Evolution soon gained general acceptance, except among a certain number of those of middle or more advanced age at the time when the Origin appeared. Although natural selection had been an essential force in producing this conviction, there gradually grew up a tendency to minimize its importance in relation to the causes originally suggested by Buffon and Lamarck, which were ably presented and further elaborated by Herbert Spencer. In August 1859 the New Americans appeared, and for a time flourishing under the inspiration of the vigorous personality of E. D. Cope. The writings of August Weismann next raised a controversy over the scope of heredity, assailing the very foundation of the hypotheses of Buffon, Lamarck and Herbert Spencer by demanding evidence that the "acquired characters" upon which they rest are capable of hereditary transmission. The quantitative determination of heredity has been the subject of much patient investigation under the leadership of Francis Galton. The question of isolation as a factor in species-formation has been greatly discussed, G. J. Romanes proposing, in his hypothesis of "Physiological Selection," that the barrier of sterility may arise spontaneously by variation between two sets of individuals as the beginning instead of the climax of specific distinction. Others have fixed their attention upon the variations, which provided the material for natural selection, and have advocated the view that evolution proceeds by immense strides instead of the minute steps in which Darwin and Wallace believed. Others, again, have found significance in the artificial production of "physically determined" or "gemmules" during individual development. All through the period a varying proportion of naturalists, probably larger now than at any other time, has followed the founders of the theory, and has sought the motive-cause of evolution in the "accumulative power of natural selection," which Darwin, as his first public statement indicates, looked upon "as by far the most important element in the production of new forms." They hold, with Darwin and Wallace, that although variation provides the essential material, natural selection, from its accumulative power, is of such paramount importance that it may be said to create new species as truly as a man may be said to make a building out of the material provided by stones of various shapes, a metaphor suggested and elaborated by Darwin, and forming the concluding sentences of The Variation of Animals and Plants under Domestication. This, probably the second in importance of all his works, was published in 1868, and may be looked upon as a complete account of the material of which he had given a very condensed abstract in the first chapter of the Origin, together with the conclusions suggested by it. He finally brought together an immense number of apparently disconnected sets of observations under his "provisional hypothesis of pangenesis," which assumes that every cell in the body, at every stage of growth and in maturity, is represented in each germ-cell by a gemmule. The germ-cell is only the meeting-place of gemmules, and the true reproductive power lies in the whole of the body-cells which despatch their representatives, hence "pangenesis." There are reasons for believing that this infinitely complex conception, in which, as his letters show, he had great confidence, was forced upon Darwin in order to explain the hereditary transmission of acquired characters involved in the small proportion of Lamarckian doctrine which he incorporated. If such transmission does not occur, a far simpler hypothesis based on the lines of Weismann's "continuity of the germ-plasm" is infinitely more plausible and far more certain.

The Descent of Man, and Selection in Relation to Sex, was published in 1871; as the title implies, it really consists of two distinct works. The first, and by far the shorter, was the full justification of his statement in the Origin that "light would be thrown on the origin of man and his history." In the second part he brought together a large mass of evidence in support of his hypothesis of sexual selection which he had briefly described in the 1858 essay. This hypothesis explains the development of colours and structures peculiar to one sex and displayed by it in courtship, by the preferences of the other sex. The majority of naturalists probably agree with Darwin in believing that the explanation is real, but relatively unimportant. It is interesting to note that only in this subject and that those of the Variation under Domestication had Darwin exhausted the whole of the material which he had collected. The Expression of the Emotions, published in 1872, offered a natural explanation of phenomena which appeared to be a difficulty in the way of the acceptance of evolution. In 1876 Darwin brought out his two previously published geological works on "The structure and distribution of Coral Reefs" and "The Form of Vegetable Mould through the Action of Worms" appeared in 1881. He also published various works on botanical subjects. The Fertilization of Orchids appeared in 1882. The subject of cross-fertilization of flowers was in Darwin's mind, as shown by his note-book in 1837. In 1841 Robert Brown directed his attention to Christian Conrad Sprengel's work (Berlin, 1793), which confirmed his determination to pursue this line of research. The Effects of Cross- and Self-Fertilization in the Vegetable Kingdom (1876) contained the direct evidence that the offspring of cross-fertilized individuals are more vigorous, as well as more numerous, than those produced by a self-fertilized parent. Different Forms of Flowers on Plants of the Same Species appeared in 1877. It is here shown that each different form, although possessing both kinds of sexual organs, is specially adapted to be fertilized by the pollen of another form, and that when artificially fertilized by its own pollen less vigorous offspring, bearing some resemblance to hybrids, are produced. He says, "no little discovery of mine ever gave me so much pleasure as the making out the meaning of heterogeneous flowers." Volcanic Climbing Plants was published in 1875, although it had, in large part, been communicated to the Linnean Society, in whose publications much of the material of several of his other works appeared. This inquiry into the nature of the movements of twining plants was suggested to him in a paper by Asa Gray. The Power of Movement in Plants (1880) was produced by him in conjunction with his son Francis. It was an inquiry into the minute power of movement possessed, he believed, by plants generally, out of which the larger movements of climbing plants of many different groups had been evolved. The work included an investigation of other kinds of plant movement due to light, gravity, &c., all of which...
he regarded as modifications of the one fundamental movement (circumutation) which exists in a highly specialized form in climbing plants. *Insectivorous Plants* (1875) is principally concerned with the description of experiments on the Sun-dew (*Drosera*), although other insect-catching plants, such as *Dionaea*, are also investigated.

Charles Darwin's long life of patient, continuous work, the most fruitful, the most inspiring, in the annals of modern science, came to an end on the 19th of April 1882. He was buried in Westminster Abbey on the 26th. It is of much interest to attempt to set forth some of the main characteristics of the man who did so much for modern science, and in so large a measure moulded the form of modern thought. Although his ill-health prevented Darwin, except on rare occasions, from attending scientific and social meetings, and thus from meeting and knowing the great body of scientific and intellectual workers of his time, probably no man has ever inspired a wider and deeper personal interest and affection. This was in part due to the intimate personal friends who represented him in the circles he was unable frequently to enter, but chiefly to the kindly, generous, and courteous nature which was revealed in his large correspondence and published writings, and especially in his treatment of opponents.

In a deeply interesting chapter of the *Life and Letters* Francis Darwin, in giving an account of his father's everyday life. Rising early, he took a short walk before breakfasting alone at 7.45, and then at once set to work, "considering the 13 hours between 8.0 and 9.30 one of his best working times." He then read his letters and listened to reading aloud, returning to work at about 10.30. At 12 or 12.15 "he considered his day's work over," and went for a walk, whether wet or fine. For a time he rode, but after accidents had occurred twice, was advised to give it up. After lunch he read the newspaper and wrote his letters or the MS. of his books. At about 3.0 he rested and smoked for an hour while being read to, often going to sleep. He then went for a short walk, and returning about 4.30, worked for an hour. After this he rested and smoked, and listened to reading until tea at 7.30, a meal which he came to prefer to late dinner. He then played two games of backgammon, read to himself, and listened to music and to reading aloud. He went to bed, generally very much tired, at 10.30, and was often much troubled by wakefulness and the activity of his thoughts. It is thus apparent that the number of hours devoted to work in each day was comparatively few. The immense amount he achieved was due to concentration during these houseful influences on the unfailing and, because of his health, the necessary regularity of his life.

The appearance of Charles Darwin has been made well known in numerous portraits and statues. He was tall and thin, being about six feet high, but looked less because of a stoop, which increased towards the end of his life. As a young man he had been active, with considerable powers of endurance, and possessed in a marked degree those qualities of eye and hand which make the successful sportsman.

Charles Darwin, as a young man, a believer in Christianity, and was sent to Cambridge with the idea that he would take orders. It is probable, however, that he had merely yielded to the influences of his home, without thinking much on the subject of religion. He first began to reflect deeply on the subject during the two years and a quarter which intervened between his return from the "Beagle" (October 2nd, 1836) and his marriage (January 26th, 1839). His own words are, "disbelief crept over me at a very slow rate, but was at last complete. The rate was so slow that I felt no distress. His attitude was that of the tolerant unaggressive agnostic, sympathizing with, and helpfully criticising, the social and intellectual influences of the English Church in his parish. He was evidently most unwilling that his opinions on religious matters should influence others, holding, as his son, Francis Darwin, says, "that a man ought not to publish, on a subject to which he has not given special and continuous thought." (L.C. I. p. 305).

In addition to the personal qualities and powers of Charles Darwin, there were other contributing causes without which the world could never have reaped the benefit of his genius. It is evident that Darwin's health could barely have endured the strain of working for a living, and that nothing would have been left over for his researches. A deep debt of gratitude is owing to his father for placing him in a position in which all his energy could be devoted to scientific work and thought. But his ill-health was such that this important and essential condition would have been insufficient without another even more essential. Francis Darwin, in the *Life and Letters* (i. pp. 159-160), writes these eloquent and pathetic words:—"No one indeed, except my mother, knows the full amount of suffering he endured, or the full amount of his wonderful patience. For all the latter years of his life she never left him for a night; and her days were so planned that all his resting hours might be shared with her. She shielded him from every avoidable annoyance, and omitted nothing that might save him trouble, or prevent him becoming over-tired, or that might alleviate the many discomfits of his ill-health. I hesitate to speak thus freely of a thing so sacred as the lifelong devotion which prompted all this constant and tender care. But it is, I repeat, a principal feature of his life, that for nearly forty years he never knew one day of the health of ordinary men, and that thus his life was one long struggle against the weariness and the strain of sickness. And this cannot be told without speaking of the one condition which enabled him to bear the strain and fight the battle of this struggle to the last."

Charles Darwin was honoured by the chief societies of the civilized world. He was made a knight of the Prussian order, "Pour le Mériête," in 1867, a corresponding member of the Berlin Academy of Sciences in 1863, a fellow in 1878, and later in the same year a corresponding member of the French Institute in the botanical section. He received the Bressa prize of the Royal Academy of Turin, and the Baly medal of the Royal College of Physicians in 1879, the Wollaston medal of the Geological Society in 1859, a Royal medal of the Royal Society in 1853, and the Copley medal in 1864. His health prevented him from accepting the honorary degree which Oxford University wished to confer on him, but his own university had stronger claims, and he received its honorary LL.D. in 1877.

Two daughters and five sons survived him, four of the latter becoming prominent in the scientific world,—Sir George Howard (b. 1845), who became professor of astronomy and experimental philosophy at Cambridge in 1883; Francis (b. 1848), the distinguished botanist; Leonard (b. 1850), a major in the royal engineers, and afterwards well known as an economist; and Horace (b. 1851), civil engineer.

**DARWIN, ERASMUS** (1731–1802), English man of science and poet, was born at Elton, in Nottinghamshire, on the 12th of December 1731. After studying at St John's College, Cambridge, and at Edinburgh, he settled in 1756 as a physician at Nottingham, but meeting with little success he moved in the following year to Lichfield. There he gained a large practice, and did much, both by example and by more direct effort, to diminish drunkenness among the lower classes. In 1781 he removed to Derby, where he died suddenly on the 19th of April 1802. The fame of Erasmus Darwin as a poet rests upon his *Botanic Garden*, a poem, written and printed in 1791. In that year also he wrote his *The Zoologist, or the Philosophy of Nature*, a Poem, with Philosophical Notes (1803), and *The Shrine of Nature* (posthumously published). The *Botanic Garden* (the second part of which—*The Loves of the Plants*—was published anonymously in 1789, and the whole of which appeared in 1791) is a long poem in the decasyllabic rhymed couplet. Its merit lies in the genuine scientific enthusiasm and interest in nature which pervades it; and of any other poetic quality—except a certain, sometimes felicitous but oftener ill-placed, elaborated pomp of words—it may without injustice be said to be almost destitute. It was for the most part written laboriously, and polished with
unsparing care, line by line, often as he rode from one patient to another, and it occupied the leisure hours of many years. The artificial character of the dictionary renders it in emotional passages stilted and even absurd, and makes Canning’s clever caricature—The Lives of the Triangles—often remarkably like the poem it satirizes: in some passages, however, it is not without a stately appropriateness. Gnomes, sylphs and nereids are introduced on almost every page, and personification is carried to an extraordinary excess. Thus he describes the Loves of the Plants according to the Linnaean system by means of a most ingenious but misplaced and amusing personification of each plant, and often even of the parts of the plant. It is significant that botanical notes are added to the poem, and that its eulogies of scientific men are frequent. Erasmus Darwin’s mind was in fact rather that of a man of science than that of a poet. His most important scientific work is his Zoonomia (1794–1796), which contains a system of pathology, and a treatise on generation, in which he, in the words of his famous grandson, Charles Robert Darwin, “anticipated the views and erroneous grounds of opinions of Lamarck.” The essence of his views is contained in the following passage, which he follows up with the conclusion “that one and the same kind of living filaments is and has been the cause of all organic life.”

Would it be too bold to imagine that, in the great length of time since that epoch began to exist, perhaps millions of ages before the commencement of the history of mankind,—would it be too bold to imagine that all warm-blooded animals have arisen from one living filament, which the Great First Cause endued with animality, with the power of acquiring new parts, attended with new propensities directed by irritations, sensations, volitions and associations, and thus possessing the faculty of continuing to improve by its own inherent activity, and of delivering down these improvements by generation to its posterity, world without end?”

In 1799 Darwin published his Physiologia, or the Philosophy of Agriculture and Gardening (1799), in which he states his opinion that plants have sensation and volition. A paper on Female Education in Boarding Schools (1797) completes the list of his works.

Robert Waring Darwin (1766–1848), his third son by his first marriage, a doctor at Shrewsbury, was the father of the famous Charles Darwin; and Violetta, his eldest daughter by his second marriage, was the mother of Francis Galton.

See Anna Seward, Memoirs of the Life of Dr. Darwin (1804); and Charles Darwin, Life of Erasmus Darwin, an introduction to an essay on his works by Ernst Krause (1879).

DASENT, SIR GEORGE WEBBE (1817–1869), English writer, was born in St Vincent, West Indies, on the 22nd of May 1817, the son of the attorney-general of that island. He was educated at Westminster school, King’s College, and Oxford, where he was a contemporary of J. T. Delane (q.v.), whose friend he had become at King’s College. On leaving the university in 1840 he was appointed to a diplomatic post in Stockholm. Here he met Jacob Grimm, and at his suggestion first interested himself in Scandinavian literature and mythology. In 1842 he published the results of his studies, a version of The Prose or Younger Edda, and in the following year he issued a Grammar of the Icelandic or Old-Norse Tongue, taken from the Swedish. Returning to England in 1845, he became assistant editor of The Times under Delane, whose sister he married; but he still continued his Scandinavian studies, publishing translations of various Norse stories. In 1843 he was appointed professor of English Literature and modern history at King’s College, London. In 1861–1862 he visited Iceland, and subsequently published Gisli the Outlaw and other translations from the Icelandic. In 1870 he was appointed a civil service commissioner and consequently resigned his post on The Times. In 1876 he was knighted. He retired from the public service in 1892, and died at Ascot on the 11th of June 1896.

In addition to the works mentioned above, he published The Story of Burnt Njal, from the Icelandic of the Njal Saga (1861). See the Life of Delane (1908), by Arthur Irwin Daseunt.

DASKHOV, CATHERINA ROMANOVA VORONTOVS, PRINCESS (1744–1810), Russian littérateur, was the third daughter of Count Roman Vorontsov, a member of the Russian senate, distinguished for his intellectual gifts. (For the family see Vorontsov.) She received an exceptionally good education, having displayed from a very early age the masculine ability and masculine tastes which made her whole career so singular. She was well versed in mathematics, which she studied at the university of Moscow, and in general literature her favourite authors were Bayle, Montesquieu, Boileau, Voltaire and Helvetius. While still a girl she was connected with the Russian court, and became one of the leaders of the party that attached itself to the grand duchess (afterwards empress) Catherine. Before she was sixteen she married Prince Mikhail Dashkov, a prominent Russian nobleman, and went to reside with him at Moscow. In 1762 she was at St Petersburg and took a leading part, according to her own account the leading part, in the coup d’état by which Catherine was raised to the throne. (See Catherine II.)

Another course of events would probably have resulted in the elevation of the Princess Dashkov’s eldest sister, Elizabeth, who was the emperor’s mistress, and in whose favour he made no secret of his intention to depose Catherine. Her relations with the new empress were not of a cordial nature, though she continued devotedly loyal. Her blunt manners, her unconcealed scorn of the male favourites that disgraced the court, and perhaps also her sense of unrequited merit, produced estrangement between her and the empress, which ended in her asking permission to be allowed to leave Europe. The empress, however, being named of the imperial guards. Her husband having meanwhile died, she set out in 1768 on an extended tour through Europe. She was received with great consideration at foreign courts, and her literary and scientific reputation procured her the entrée to the society of the learned in most of the capitals of Europe. In Paris she secured the warm friendship and admiration of Diderot and Voltaire. She showed in various ways a strong liking for England and the English. She corresponded with Garrick, Dr Blair and Principal Robertson; and when in Edinburgh, where she was very well received, she arranged to entrust the education of her son to Principal Robertson. In 1782 she returned to the Russian capital, and was at once taken into favour by the empress who strongly sympathized with her in her literary tastes, and specially in her desire to elevate Russ to a place among the literary languages of Europe. Immediately after her return the princess was appointed “directeur” of the St Petersburg Academy of Arts and Sciences; and in 1784 she was named the first president of the Russian Academy, which had been founded by Catherine’s suggestion. Ivanovich Vorontsov-Dashkov acquiesced in the empress’s resolutions, and executed a part of the work herself. She edited a monthly magazine; and wrote at least two dramatic works, The Marriage of Fabian, and a comedy entitled Toissiokoff. Shortly before Catherine’s death the friends quarrelled over a tragedy which the princess had allowed to find a place in the publications of the Academy, though it contained revolutionary principles, according to the empress. A partial reconciliation was effected, but the princess soon afterwards retired from court. On the accession of the emperor Paul in 1796 she was deprived of all her offices, and ordered to retire to a miserable village in the government of Novgorod, “to meditate on the events of 1762.” After a time the sentence was partially recalled on the petition of her friends, and she was permitted to pass the closing years of her life on her own estate near Moscow, where she died on the 4th of January 1810.

Her son, the last of the Dashkov family, died in 1807 and bequeathed his fortune to his cousin Ilarioun Vorontsov, who thereafter used his name. The memoirs of the princess were published in 1840 in London in two volumes. They were edited by Mrs W. Bradford, who, as Miss Wilmot, had resided with the princess between 1803 and 1808, and had suggested their preparation.

DASS, PETTER (1647–1708), the “father” of modern Norwegian poetry, was the son of Peter Dunders, a Scottish merchant of Dundee, who, leaving his country about 1630 to
escape the troubles of the Presbyterian church, settled in Bergen, and in 1646 married a Norse girl of good family. Petter Dass was born in 1647 on the island of Nord Herø, on the north coast of Norway. Seven years later his father died, and his mother placed him with his aunt, the wife of the priest of another little island-parish. In 1660 he was sent to school at Bergen, in 1665 to the university of Copenhagen, and in 1667 he began to earn his daily bread as a private tutor. In 1672 he was ordained priest, and remained till 1681 as under-chaplain at Nesne, a little parish near his birthplace; for eight years more he was resident chaplain at Nesne; and at last in 1689 he received the living of Alistahou, the most important in the north of Norway. The rule of Alistahou extended over all the neighbouring districts, including Dass’ native island of Herø, and its privileges were accompanied by great perils, for it was necessary to be constantly crossing stormy thirts of sea. Dass lived here in quietude, with something of the honours and responsibilities of a bishop, brought up his family in a God-fearing way, and wrote endless reams of verses. In 1700 he asked leave to resign the living in favour of his son Anders Dass, but this was not permitted; in 1706, however, Anders became his father’s chaplain. About this time Petter went to Bergen, where he visited Dorothea Engelbrechtsdatter, with whom he had been for many years in correspondence. He continued to write till 1707, and died in August 1708. The materials for his biography are very numerous; he was regarded with universal curiosity and admiration in his lifetime; and, besides, he left a garrulous autobiography in verse. A portrait, painted in middle age, now in the church of Melhus, near Trondhjem, represents him in canonicals, with deep red beard and hair, the latter waved and silky, and a head of massive proportions. The face is full of fire and vigour. His writings passed in MS. from hand to hand, and few of them were printed in his lifetime. Nordlands Trompet (The Trumpet of Nordland), his greatest and most famous poem, was not published till 1739; Den norske Dale-vise (The Norwegian Song of the Valley of Dale) in 1689; and Dansk Tidkerfordis (Spiritual Pastime), a volume of sacred poetry, was published in 171. The Trumpet of Nordland remains as fresh as ever in the memories of the inhabitants of the north of Norway; boatmen, peasants, priests will alike repeat long extracts from it at the slightest notice, and its popularity is unbounded. It is a rhyming description of the province of Nordland, its natural features, its trades, its advantages and its drawbacks, given in dancing verse of the most breathless kind, and full of humour, fancy, wit and quaint learning. The other poems of Petter Dass are less universally read; they abound, however, in queer turns of thought, and fine homely fancies.

The collected writings of Dass were edited (3 vols., Christiania, 1873-1877) by Dr A. E. Eiksen.

DASYURE, a by-name for any member of the zoological family Dasyuridae. (See Marsupialia.) The name is better restricted to animals of the typical genus Dasyurus, sometimes called true Dasyure. These are mostly inhabitants of the Australian continent and Tasmania, where in the economy of nature they take the place of the smaller preadaceous Carnivora, the cats, civets and weasels of other parts of the world. They hide themselves in the daytime in holes among rocks or in hollow trees, but prowl about at night in search of the small living mammals and birds which constitute their prey, and are to some extent arboreal in habit. The spot-tailed dasyure (D. maculatus), about the size of a cat, inhabiting Tasmania and Southern Australia, has transversely striated pads on the soles of the feet. These organs are also present in the North Australian dasyure (D. hallucatus) and the Papuan D. albopunctatus, and are regarded by Oldfield Thomas as indication of arboreal habits; in the common dasyure (D. viverrinus) from Tasmania and Victoria, and the black-tailed dasyure (D. geoffroyi) from South Australia, these feet-pads are absent, whence these species are believed to track their prey on the ground. The urbane dasyure (Sarcophilus urbicus), often called the ‘‘Tasmanian Devil’’, constitutes a distinct genus. In size it may be compared to an English badger; the general colour of the fur is black tinged with brown, with white patches on the neck, shoulders, rump and chest. It is a burrowing animal, of nocturnal habits, intensely carnivorous, and commits great depredations on the sheepywards and poultry-lofts of the settlers. In writing of this species Kreft says that one—by no means a large one—escaped from confinement and killed in two nights fifty-four fowls, six geese, an albatross and a cat. It was recaptured in what was considered a stout trap, with a door constructed of iron bars as thick as a lead pencil, but escaped by twisting this solid obstacle aside.

DATE PALM, The dates of commerce are the fruit of a species of palm, Phoenix dactylifera, a tree which ranges from the Canary Islands through Northern Africa and the south-east of Asia to India. It has been cultivated and much prized throughout most of these regions from the remotest antiquity. Its cultivation and use are described on the mural tablets of the ancient Assyrians. In Arabia it is the chief source of national wealth, and its fruit forms the staple article of food in that country. The tree has also been introduced along the Mediterranean shores of Europe; but it does not grow so far north as European plants are only used to supply leaves for the festival of Palm Sunday among Christians, and for the celebration of the Passover by Jews. It was introduced into the new world by early Spanish missionarics, and is now cultivated in the dry districts of the south-western United States and in Mexico. The date palm is a beautiful tree, growing to a height of from 60 to 80 ft., and its stem, which is strongly marked with old leaf-scars, terminates in a crown of graceful shining pinnate leaves. The flowers spring in branching spadics from the axils of the leaves, and as the trees are unisexual it is necessary in cultivation to fertilize the female flowers by artificial means. The fruit is oblong, fleshy and contains one very hard seed which is deeply burrowed on the inside. The fruit varies much in size, colour and quality under cultivation. Regarding this fruit, W. G. Palgrave (Central and Eastern Arabia) remarked: ‘‘Those who, like most Europeans at home, are not prepared to eat the dry dates, will find the dried specimens of that fruit shown beneath a label in shop-windows, can hardly imagine how delicious it is when eaten fresh and in Central Arabia. Nor is it, when newly gathered, heating,—a defect inherent to the preserved fruit everywhere; nor does its richness, however great, bring satiety; in short it is an article of food alike pleasant and healthy.’’ In the oases of Sahara, and in other parts of Northern Africa, dates are pounded and pressed into a cake for food. The dried fruit used for dessert in European countries contains more than half its weight of sugar, about 6% of albumen, and 12% of gummy matter. All parts of the date palm yield valuable economic products. Its trunk furnishes timber for house-building and furniture; the leaves supply thatch; their footstalks are used as fuel, and also yield a fibre from which cordage is spun.

Date sugar is a valuable commercial product of the East Indies, obtained from the sap or toddy of Phoenix sylvestris, the toddy palm, a tree so closely allied to the date palm that it has been supposed does not ripen so far north as these cultivated varieties. The juice, when not boiled down to form sugar, is called fresh, or fermented and distilled to form arrack. The uses of the other parts and products of this tree are the same as those of the date-palm products. Date palm meal is obtained from the stem of a small species, Phoenix farinifera, growing in the hill country of southern India.

For further details see Sir G. Watt, Dictionary of the Economic Products of India (1892); and The Date Palm, U.S. Department of Agriculture, Bureau of Plant Industry, Bulletin No. 53 (W. T. Swing), 1906.

DATIA, a native state of Central India, in the Bundelkhand agency. It lies in the extreme north-west of Bundelkhand, near Gwalior, and is surrounded on all sides by other states of Central India, except on the east where it meets the United Provinces. The state came under the British government after the treaty of Bassein in 1802 Area, 911 sq. m. Pop. (1901) 173,759. Estimated revenue, £70,000; tribute to Sindha paid through the

1. Lat. dactylus, finger, hence fruit of the date palm, gave 0. Fr. date, mod. date; distinguish “date,” in chronology, from Lat. datum, date, given, used at the beginning of a letter, &c., to show time and place of writing, e.g. Datum Romanum.
DATIVE—DAUBENY

British Government, £1000. The chief, whose title is maharaja, is a Rajput of the Bundela clan, being descended from a younger son of a former chief of Orchha. The state suffered from famine in 1896–1897, and again to a less extent in 1899–1900. It is traversed by the branch of the Indian Midland railway from Jhansi to Gwalior. The town of Datia has a railway station, 16 m. from Jhansi. Pop. (1901) 24,071. It is surrounded by a stone wall, enclosing handsome palaces, with gardens; the palace of Bir Singh Deo, of the 17th century, is "one of the finest examples of Hindu domestic architecture in India" (Imperial Gazetteer of India, 1908).

DATIVE (Lat. dativus, giving or given, from dare, to give), the name, in grammar, of the case of the "indirect object," the person or thing to or for whom or which anything is given or done. In law, the word signifies something, such as an office, which may be disposed of at will or pleasure, and is opposed to perpetual. In Scots law the term is applied to persons, duties or powers, appointed or granted by a court of law; thus an "executor-dative" is an executor appointed by the court and not by a testator. It answers, therefore, to the English administrator (q.e.). In Roman law, a tutor was either dativeus, if expressly nominated in a testament, or adoptus, if a power of selection was given.

DATOLITE, a mineral species occurring in basic igneous rocks, and boron orthosilicate, Ca(BOH)SiO. It was first observed by J. Ersmark in 1806, and named by him from δατολίθος, "to divide," and λίθος, "stone," in allusion to the granular structure of the massive mineral. It usually occurs as well-developed glassy crystals bounded by numerous bright faces, many of which often have a more or less pentagonal outline. The crystals were for a long time considered to be orthorhombic, and indeed they approach closely to this system in habit, interfacial angles and optical orientation; humboldtite was the name given by A. Lévy in 1833 to monoclinic crystals supposed to be distinct from datolite, but the two were afterwards proved to be identical. The mineral also occurs as masses with a granular to compact texture; when compact the fractured surfaces have the appearance of porcelain. A fibrous variety with a botryoidal or globular surface is known as botryolite. Datolite is white or colourless, often with a greenish tinge; it is transparent or opaque. Hardness 5–5½; specific gravity 3.0.

Datolite is a mineral of secondary origin, and in its mode of occurrence a zeolite, being found with them in the amygduoidal cavities of basic igneous rocks such as basalts; it is also found in gneiss and serpentine, and in metallic veins and in beds of iron ore. At Arendal in Norway, the original locality for both the crystallized and botryoidal varieties, it is found in a bed of magnetite. In amygduoidal basaltic rocks it is found at Bisphoont in Renfrewshire and near Edinburgh; and as excellent crystallized specimens at several localities in the United States, e.g. at Westfield in Massachusetts, Bergen and Paterson in New Jersey, and in the copper-mining region of Lake Superior. At St Andreasberg in the Harz it occurs both in diabase and in the veins of silver ore. Fine specimens have recently been obtained from Tasmania. Large crystals of datolite completely altered to chaledony were formerly found with magnetite in the Haytor iron mine on Dartmoor in Devonshire; to these pseudomorphs the name haytorite has been applied. (L. J. S.)

DAUB, KARL (1765–1836), German Protestant theologian, was born at Cassel on the 26th of March 1765. He studied philosophy, philology and theology at Marburg in 1786, and afterwards transferred himself to that of Heidelberg, where he died on the 22nd of November 1836. Daub was one of the leaders of a school which sought to reconcile theology and philosophy, and to bring about a speculative reconstruction of orthodox dogma. In the course of his intellectual development, he came successively under the influence of Kant, Schelling and Hegel, and on account of the different phases through which he passed he was called the "Talleyrand of German thought." There was one great defect in his speculative theology: he ignored historical criticism. His purpose was, as Otto Pfleiderer says, "to connect the metaphysical ideas, which had been arrived at by means of philosophical dialectic, directly with the persons and events of the Gospel narratives, thus raising these above the region of ordinary experience into that of the supernatural, and regarding the most absurd assertions as philosophically justified. Daub had become so hopelessly addicted to this perverse principle that he deduced not only Jesus as the embodiment of the philosophical idea of the union of God and man, but also Judas Iscariot as the embodiment of the idea of a rival god, or Satan." The three stages in Daub's development are clearly marked in his writings. His Lehrbuch der Katechetik (1801) was written under the spell of Kant. His Theolologena (1806), his Einleitung in das Studium der christl. Dogmatik (1810), and his Judas Ischariot (2 vols., 1816, 2nd ed., 1818), were all written in the spirit of Schelling, the last of them a change in Schelling himself from theosophy to positive philosophy. Daub's Die dogmatische Theologiejüugter Zeit oder die Selbstsucht in der Wissenschaft des Glaubens (1833), and Vorlesungen über die Proligomena zur Dogmatik (1839), are Hegelian in principle and obscure in language.

DAUBENTON, LOUIS-JEAN-MARIE (1716–1800), French naturalist, was born at Montbar (Côte d'Or) on the 29th of May 1716. His father, Jean Daubenton, a notary, destined him for the church, and sent him to Paris to learn theology, but the study of medicine was more to his taste. The death of his father in 1756 set him free to follow his own inclinations, and accordingly in 1741 he graduated in medicine at Reims, and returned to his native town with the intention of practising as a physician. But about this time Buffon, also a native of Montbar, had formed the plan of bringing out a grand treatise on natural history, and in 1742 he invited Daubenton to assist him by providing the anatomical descriptions for that work. The characters of the two men were opposed in almost every respect. Buffon was violent and impatient; Daubenton, gentle and patient; Buffon was rash in his judgments, and imaginative, seeking rather to divine than to discover truths; Daubenton was cautious, and believed nothing he had not himself been able to see or ascertain. From nature each appeared to have received the qualities requisite to temper those of the other; and a more suitable coadjutor than Daubenton would have been difficult for Buffon to obtain. In the first section of the new work Daubenton gave descriptions and details of the dissection of 182 species of quadrupeds, thus procuring for himself a high reputation. Formerly the envy of Réaumur, who considered himself as at the head of the learned in natural history in France, a feeling of jealousy induced Buffon to dispense with the services of Daubenton in the preparation of the subsequent parts of his work, which, as a consequence, lost much in precision and scientific value. Buffon afterwards perceived and acknowledged his error, and renewed his intimacy with his former associate. The number of dissertations on natural history which Daubenton published in the memoirs of the French Academy is very great. Zoological descriptions and dissections, the comparative anatomy of recent and fossil animals, vegetable physiology, mineralogy, experiments in agriculture, and the introduction of the merino sheep into France gave active occupation to his energies; and the cabinet of natural history in Paris, of which in 1744 he was appointed keeper and demonstrator, was arranged and considerably enriched by him; from 1775 Daubenton lectured on natural history in the college of medicine, and in 1783 on rural economy at the Alfort school. He was also professor of mineralogy at the Jardin du Roi. As a lecturer he was in high repute, and to the last retained his popularity. In December 1790 he was appointed a member of the senate, but at the first meeting which he attended he fell from his seat in an apoplectic fit, and after a short illness died at Paris on the 1st of January 1800.

DAUBENY, CHARLES GILES BRIDLE (1795–1867), English chemist, botanist and geologist, was the third son of the Rev. James Daubeny, and was born at Stratton in Gloucestershire on
the 11th of February 1795. In 1805 he went to Winchester, and in 1810 he was elected to a demeship at Magdalen College, Oxford, where the lectures of Dr Kidd first awakened in him a desire for the cultivation of natural science. In 1814 he graduated with second-class honours, and in the next year he obtained the prize for the Latin essay. From 1815 to 1818 he studied medicine in London. In 1819 he took his M.D. degree at Oxford and was a fellow of the College of Physicians. In 1819, in the course of a tour through France, he made the volcanic district of Auvergne a special study, and his Letters on the Volcanos of Auvergne were published in The Edinburgh Journal, 1820-21. He was elected F.R.S. in 1822. By subsequent journeys in Hungary, Transylvania, Italy, Sicily, France and Germany he extended his knowledge of volcanic phenomena; and in 1826 the results of his observations were given in a work entitled A Description of Active and Extinct Volcanos (2nd ed., 1848). In common with Gay Lussac and Davy, he held subteraneous thermic disturbances to be probably due to the contact of water with metals of the alkalis and alkaline earths. In November 1832 Daubeny succeeded Dr Kidd as professor of chemistry at Oxford, and retained this post until 1835; and in 1834 he was appointed to the chair of botany, to which he was subsequently attached for a rural economy. At the Oxford botany he conducted numerous experiments upon the effect of changes in soil, light and the composition of the atmosphere upon vegetation. In 1830 he published in the Philosophical Transactions a paper on the iodine and bromine of mineral waters. In the following year appeared his Introduction to the Atomic Theory, which was succeeded by a supplement in 1840, and in 1850 by a second edition. In 1831 Daubeny represented the universities of England at the first meeting of the British Association, which at his request held their next session at Oxford. In 1836 he communicated to the Association a report on the subject of mineral and thermal waters. In 1837 he visited the United States, and acquired there the materials for papers on the thermal springs and the geology of North America, read in 1838 before the Ashmolean Society and the British Association. In 1836 he became president of the latter body at its meeting at Cheltenham. In 1841 Daubeny published his Lectures on Agriculture; in 1857 his Lectures on Roman Husbandry; in 1858 Climatist in the United States; and into its influence on Vegetable Life; and in 1865 an Essay on the Trees and Shrubs of the Ancients, and a Catalogue of the Trees and Shrubs indigenous to Greece and Italy. His last literary work was the collection of his Miscellaneous, published in two volumes, in 1867. In all his undertakings Daubeny was actuated by a practical spirit and a desire for the advancement of knowledge; and his personal influence on his contemporaries was in keeping with the high character of his various literary productions. He died in Oxford on the 12th of December 1867.

DAUBIGNY, CHARLES FRANÇOIS (1817-1878), French landscape painter, allied in several ways with the Barbizon School, was born in Paris, on the 15th of February 1817, but spent much time as a child at Valmondois, a village on the Oise to the north-west of Paris. Daubigny was the son of an artist, and most of his family were painters. He began to paint very early in life, and at the age of seventeen he took a studio of his own. Within twelve months he had saved enough to go to Italy, where he studied and painted for nearly two years; then returned to Paris, not to leave it again until, in 1860, he took a house at Auvers on the Oise. By 1837 Daubigny had become famous as a river and landscape painter, although he had been devoting himself as well to drawing in black-and-white, to etching, wood engraving, and lithography. In 1855 his picture, "Lock at Optevoz," now in the Louvre, was purchased by the state; four years later Daubigny was created knight of the Legion of Honour, and in 1874 he was promoted to be an officer. In 1866, at the invitation of Lord, then Mr. Leighon and others, he visited London, where, however, he was hurt by his now famous "Moonlight" being badly hung in the Old Royal Academy. But the personal encouragement of his admirers in England made up for the disappointment, and the sale of his picture to a Royal Academician greatly pleased him. In 1870-1871 he again visited London, and subsequently Holland, where he painted a number of river scenes with windmills. In 1874, having returned to Paris, he fell ill, and from that time until he died (on the 19th of February 1878) his work won less distinction than before. In 1904 the municipality of Auvers-sur-Oise decided to erect a bronze monument to Daubigny's memory.

Daubigny's finest pictures were painted between 1864 and 1874, and these for the most part consist of carefully completed landscapes with trees, river and a few ducks. It has curiously been said, yet with some appearance of truth, that when Daubigny liked his pictures himself he added another duck or two, so that the number of ducks often indicates greater or less artistic quality in his pictures. One of his sayings was, "The best pictures do not sell," as he frequently found his finest achievements little understood. Yet although during the latter part of his life he was considered a highly successful painter, the money value of his pictures since his death has increased nearly tenfold. Daubigny is chiefly preferred in his riverside pictures, of which he painted a great number, but although there are two large landscapes by Daubigny in the Louvre, neither is a river scene as Daubigny was not so typical as many of his smaller Oise and Seine pictures.

The works of Daubigny are, like Corot's, to be found in many modern collections. His most ambitious canvases are: "Spring-time" (1857), in the Louvre; "Borde de la Cure, Morvan" (1864); "Villerneuve sur Mer" (1864); "Moonlight" (1865); "Andréys sur Oise" (1868); and "Return of the Flock—Moonlight" (1878). His followers and pupils were his son Karl, who sometimes painted so well that his works are occasionally mistaken for those of his father, though in few cases do they equal his father's mastery, Oudinot, Delpy and Damoye.

(D. C. T.)

DAUBRÉE, GABRIEL AUGUSTE (1814-1896), French geologist, was born at Metz, on the 25th of June 1814, and educated at the École Polytechnique in Paris. At the age of 19 he had qualified as a mining engineer, and in 1838 he was appointed to take charge of the mines of the Bas-Rhin (Alsace), and subsequently to be professor of mineralogy and geology at the Faculty of Sciences, Strassburg. In 1859 he became engineer in chief of mines, and in 1861 he was appointed professor of geology at the museum of natural history in Paris and was also elected member of the Academy of Sciences. In the following year he became professor of mineralogy at the École des Mines, and in 1872 director of that school. In 1880 the Geological Society of London awarded him the Wollaston medal. His published researches date from 1841, when the origin of certain tin minerals attracted his attention; he subsequently discussed the formation of bog-iron ore, and worked out in detail the geology of the Bas-Rhin (1852). From 1857 to 1861, while engaged in engineering works connected with the springs of Plombières, he made a series of interesting observations on thermal waters and their influence on the Roman masonry through which they made their exit. He was, however, especially distinguished for his long continuance of certain dangerous experiments on the artificial production of minerals and rocks. He likewise discussed the permeability of rocks by water, and the effects of such infiltration in producing volcanic phenomena; he dealt with the subject of metamorphism, with the deformations of the earth's crust, with earthquakes, and with the composition and classification of meteorites. He died in Paris on the 29th of May 1896.

His publications were: Études et expériences synthétiques sur le métamorphisme et sur la formation des roches cristallines (1860); Études synthétiques de géologie expérimentale (1879); Les Eaux souterraines à l'époque actuelle (2 vols., 1887); Les Eaux souterraines aux époques anciennes (1887).
DAUDET—DAULATABAD

DAUDET, ALPHONSE (1840–1897). French novelist, was born at Nîmes on the 13th of May 1840. His family, on both sides, belonged to the bourgeoisie. The father, Vincent Daudet, was a silk manufacturer, a man dogged through life by misfortune and failure. The lad, amid much trouancy, had but a depressing boyhood. In 1856 he left Lyons, where his schooldays had been mainly spent, and began life as an usher at Alais, in the south. The position proved to be intolerable. As Dickens declared that all through his prosperous career he was haunted in dreams by the miseries of his apprenticeship to the blacking business, so Daudet says that for months after leaving Alais he would wake with horror thinking he was still among his unruly pupils. On the 1st of November 1857 he abandoned teaching, and took refuge with his brother Ernest, only some three years his senior, who was trying, "and thereto soberly," to make a living as a journalist in Paris. Alphonse betook himself to his pen likewise,—wrote poems, shortly collected into a small volume Les Amoureuses (1858), which met with a fair reception,—obtained employment on the Figaro, then under Cartier de Vilmessant's energetic editorship, wrote two or three plays, and began to be recognized, among his two peculiar interests in literature, as possessing individuality and promise. Morny, the emperor's all-powerful minister, appointed him to be one of his secretaries,—a post which he held till Morny's death in 1865,—and showed him no small kindness. He had put his foot on the road to fortune.

In 1866 appeared Lettres de mon moulin, which won the attention of many readers. The first of his longer books, Le petit chien (1868), did not, however, produce any very popular sensation. It is, in its main feature, the story of his own earlier years told with much grace and pathos. The year 1872 produced the famous Avventures prodigieuses de Tartarin de Tarascon, and the three-act piece L'Artéisiennne. But Promont jeune et Résilier aîné (1874) at once took the world by storm. It struck a note, not new certainly in English literature, but comparatively new in French. Here was a writer who possessed the gift of laughter and tears, a writer not only sensitive to pathos and sorrow, but also to moral beauty. He could create too. His characters were real and not typical; his plots, the men who in life's battle had flashed in the pan, were touched with a master hand. The book was alive. It gave the illusion of a real world. Jack, the story of an illegitimate child, a martyr to his mother's selfishness, which followed in 1876, served only to deepen the same impression. Henceforward his career was that of a very successful man of letters,—publishing novel on novel, Le Nabab (1877), Les Rois en exil (1879), Numa Roumestan (1881), Sophie (1884), L'Immortel (1888),—and writing for the stage at frequent intervals,—giving to the world his reminiscences in Trente ans de Paris (1887), and Souvenirs d'un homme de lettres (1888). These, with the three Tartarins,—Tartarin the mighty hunter, Tartarin the mountaineer, Tartarin the colonist,—and the admirable short stories, written for the most part before he had acquired fame and fortune, constitute his life work.

Though Daudet defended himself from the charge of imitating Dickens, it is more than likely he believed that so many similarities of spirit and manner were quite unsought. What, however, was purely his own was his style. It is a style that may rightly be called "impressionist," full of light and colour, not descriptive after the old fashion, but flashing its intended effect by a masterly juxtaposition of words that are like pigments. Nor does it convey, like the style of the Goncourt, for example, a constant feeling of words. It is full of felicity and charm,—un charmeur Zola has called him. An intimate friend of Edmond de Goncourt (who died in his house), of Flaubert, of Zola, Daudet belonged essentially to the naturalist school of fiction. His own experiences, his surroundings, the men with whom he had been brought into contact, various persons who had played a part, more or less public, in Paris life—all passed into his art. But he vivified the material supplied by his memory. His world has the great gift of life. L'Immortel is a bitter attack on the French Academy, to which August Daudet never belonged.

Daudet wrote some charming stories for children, among which may be mentioned La Belle Nérmise, the story of an old boat and her crew. His married life—he married in 1867 Julia Allard—seems to have been singularly happy. There was perfect intellectual harmony, and Madame Daudet herself possessed much of his literary gift; she is known by her Impressions de nature et d'art (1879), L'Enfance d'une Parisienne (1883), and by some literary studies written under the pseudonym of Karl Steen. In his later years Daudet suffered from insomnia, failure of health and consequent use of chloral. He died in Paris on the 17th of December 1897.

The story of Daudet's earlier years is told in his brother Ernest Daudet's Mon frère et moi. There is a good deal of autobiographical detail in Daudet's Trente ans de Paris and Souvenirs d'un homme de lettres, also several biographical sketches of him in other books. The memoirs in the Journal des Goncourts are numerous. See also L. A. Daudet, Alphonse Daudet (1898), and biographical and critical essays by R. H. Sherard (1894); by A. Gerstmann (1883); by B. Diederich (1900); and A. Hermitz (1905), and a bibliography by J. Brivois (1898); also The Works Alphonse Daudet, translated by L. Egan, H. Frith, E. Bartow (1902, etc.). Criticism of Daudet is also to be found in F. Brunetiére, Le Roman naturaliste (new ed., 1897); J. Lemaitre, Les Contemporains (vols. ii. and iv.); G. Pel liére, Le Mouvement littéraire au XIXe siècle (1890); A. Symons, Studies in Prose and Verse (1904). (F. T. M.)

DAULATABAD, a hill-fortress in Hyderabad state, India, about 10 m. N.W. of the city of Aurangabad. The former city of Daulatabad (Deogiri) has shrunk into a mere village, though to its ancient greatness witness is still borne by its magnificent fortress, and by remains of public buildings noble even in their decay. The fortress stands on a conical rock crowning a hill that rises almost perpendicularly from the plain to a height of some 600 ft. The outer wall, 2½ m. in circumference, once enclosed the ancient city of Deogiri (Devagiri), and between this and the base of the upper fort are three lines of defences. The fort is a place of extraordinary strength. The only means of access to the summit is afforded by a narrow bridge, with passage for not more than two men abreast, and a long gallery, excavated in the rock, which has for the most part a very gradual upward slope, but about midway is intercepted by a steep stair, the top of which is covered by a gradually diminishing flight of war to form the hearth of a huge fire kept burning by the garrison above. Besides the fortifications Daulatabad contains several notable monuments, of which the chief are the Chand Minar and the Chini Mahal. The Chand Minar, considered one of the most remarkable specimens of Mahommedan architecture in southern India, is a tower 210 ft. high and 70 ft. in circumference at the base, and was originally covered with beautiful Persian glazed tiles. It was erected in 1445 by Ala-ud-din Bahmani to commemorate his capture of the fort. The Chini Mahal, or China Palace, is the ruin of a building once of great beauty. In it Abul Hasan, the last of the Kutb Shahi kings of Golconda, was imprisoned by Aurangzeb in 1687.

Deogiri is said to have been founded c. A.D. 1187 by Bhilama I., the prince who renounced his allegiance to the Chalukyas and established the power of the Yadava dynasty in the west. In 1294 the fort was captured by Ala-ud-din Khilji, and the rajas, compelled to pay their tribute, were reduced to pay tribute. The tribute falling into arrear, Deogiri was again occupied by the Mahommedans under Malik Kafur, in 1397 and 1398, and in 1318 the last raja, Harpal, was slain alive. Deogiri now became an important base for the operations of the Musulmans conquering expeditions southwards, and in 1339 Mahommed ben Tughlak Shah determined to make it his capital, changed its name to Daulatabad ("Abode of Prosperity"), and made arrangements for transferring to it the whole population of Delhi. The project was interrupted by troubles which summoned him to the north; during his absence the Musulman governors of the Deccan revolted; and Daulatabad itself fell into the hands of Zafar Khan, the governor of Gulbarga. It remained in the hands of the Bahamanis till 1526, when it was taken by the Nizam Shahis.

It was captured by the emperor Akbar, but in 1595 it again surrendered to Ahmad Nizam Shah of Ahmednagar, on the fall of whose dynasty in 1660 it passed into the hands of the usurper, the Nizam Shahi minister Malik Amber, originally an Abyssinian slave, who was the founder of Kharki (the present Aurangabad).
His successors held it until their overthrow by Shab Jahan, the Mogul emperor, in 1633; after which it remained in the possession of the Delhi emperors until, after the death of Aurangzeb, it fell to the first nizam of Hyderabad. Its glory, however, had already decayed owing to the removal of the seat of government by the emperors to Aurangabad.

**DAUMIER, HONORÉ** (1808-1879), French caricaturist and painter, was born at Marseilles. He showed in his earliest youth an irresistible inclination towards the artistic profession, which his father vainly tried to check by placing him first with a hussier, and subsequently with a bookseller. Having mastered the technique of lithography, Daumier started his artistic career by producing plates for music publishers, and illustrations for advertisements; these were followed by anonymous work for publishers, in which he followed the style of Charlet and displayed considerable enthusiasm for the Napoleonic legend. When, in the reign of Louis Philippe, Philipon launched the comic journal, *La Caricature*, Daumier joined its staff, which included such powerful artists as Devéria, Rauffet and Grandville, and started upon his pictorial campaign of scatting satire upon the foibles of the bourgeoisie, the corruption of the law and the incompetence of a blundering government. His caricature of the king as "Gargantuá" led to Daumier’s imprisonment for six months at Ste Pélage in 1832. The publication of *La Caricature* was discontinued soon after, but Philipon provided a new field for Daumier’s activity when he founded the *Charivari*. For this journal Daumier produced his famous social caricatures, in which bourgeois society is held up to ridicule in the figure of Robert Macaire, the hero of a then popular melodrama. Another series, "L’histoire ancienne," was directed against the pseudo-classicism which held the art of the period in fetters. In 1848 Daumier embarked again on his political campaign, still in the service of *Charivari*, which he left in 1850 and rejoined in 1864. In spite of his prodigious activity in the field of caricature—the list of Daumier’s lithographed plates compiled in 1904 numbers no fewer than 3,058—he found time for flight in the higher sphere of painting. Except for the searching truthfulness of his vision and the powerful directness of his brushwork, it would be difficult to recognize the creator of Robert Macaire, of *Les Bas bleus, Les Bohémiers de Paris*, and the *Masques*, in the paintings of "Christ and His Apostles" at the Ryks Museum in Amsterdam, or in his "Good Samaritan," "Don Quixote and Sancho Panza," "Christ Mocked," or even in the sketches in the Ionides Collection at South Kensington. But as a painter, Daumier, one of the pioneers of naturalism, was before his time, and did not meet with success until in 1878, a year before his death, when M. Durand-Ruel collected his works for exhibition at his galleries and demonstrated the full range of the genius of the man who has been well called the Michelangelo of caricature. At the time of this exhibition Daumier, totally blind, was living in a cottage at Valmondois, which was placed at his disposal by Corot, and where he breathed his last in 1879. An important exhibition of his works was held at the École des Beaux-Arts in 1900.

His life and art were made the subject of an important volume by Aubry in 1898; a selection (Paris, Librairie de l’Art), and Henri Frantz and Octave Uzanne, *Daumier et Gavarni* (London, The Studio, 1904), with a large selection of the artist’s work.

**DAUN (DAHAU), LEOPOLD JOSEF, COUNT VON** (1705-1766), prince of Thiano, Austrian field marshal, was born at Vienna on the 24th of September 1705. He was intended for the church, but his natural inclination for the army, in which his father and grandfather had been distinguished generals, proved irresistible. In 1718 he served in the campaign in Sicily, in his father’s regiment. He had already risen to the rank of colonel when he saw further active service in Italy and on the Rhine in the War of the Polish Succession (1734–35). He continued to add to his distinctions by the war against the Turks (1737–39), in which he attained the rank of a general officer. In the War of the Austrian Succession (1740–42), Daun, already a lieutenant field marshal in rank, distinguished himself by the careful leadership which was afterwards his greatest military quality. He was present at Chotusitz and Prague, and led the advanced guard of Khevenhuller’s army in the victorious Dauns’s campaign of 1743. Field Marshal Traun, who succeeded Khevenhuller in 1744, thought equally highly of Daun, and entrusted him with the rearguard of the Austrian army when it escaped from the French to attack Frederick the Great. He held important commands in the battles of Hohenfriedberg and Soor, and in the same year (1745) was promoted to the rank of Feldzeugmeister. After this he served in the Low Countries, and was present at the battle of Val. He was highly valued by Maria Theresa, who made him commandant of Vienna and a knight of the Golden Fleece, and in 1754 he was elevated to the rank of field marshal.

During the interval of peace that preceded the Seven Years’ War he was engaged in carrying out an elaborate scheme for the reorganization of the Austrian army; and it was chiefly through his instrumentality that the military academy was established at Wiener-Neustadt in 1751. He was not actively employed in the first campaigns of the war, but in 1757 he was placed at the head of the army which was raised to relieve Prague. On the 18th of June 1757 Daun defeated Frederick for the first time in his career in the desperately fought battle of Kolin (q.v.). In commemoration of this brilliant exploit the queen immediately instituted a military order bearing her name, of which Daun was nominated first grand cross. The union of the relieving army with the forces of Prince Charles at Prague reduced Daun to the position of second in command, and as such he took part in the pursuit of the Prussians and the victory of Breslau. Frederick now reappraised and won the most brilliant victory of the age at Leuthen. Daun was present on that field, but was not held accountable for the disaster, and when Prince Charles resigned his command, Daun was appointed in his place. With the campaign of 1758 began the war of manœuvre in which Daun, if he missed, through over-caution, many opportunities of crushing the Prussians, at least maintained a steady and cool resistance to the fiery strategy of Frederick. In 1758 Major-General Loudon, acting under Daun’s instructions, forced the king to raise the siege of Olmütz, and later in the same year Daun himself surprised Frederick at Hochkirch and inflicted a severe defeat upon him (October 14th). In the following year the war of manœuvre continued, and on the 20th and 21st of November he surrounded the entire corps of General Finck at Maxen, forcing the Prussians to surrender. These successes were counter-balanced in the following year by the defeat of Loudon at Lignitz, which was attributed to the dilatoriness of Daun, and Daun’s own defeat in the great battle of Torgau (q.v.). In this engagement Daun was so severely wounded that he had to return to Vienna to recruit.

He continued to command until the end of the war, and afterwards worked with the greatest energy at the reorganization of the imperial forces. In 1762 he had been appointed president of the Hofkriegsrath. He died on the 5th of February 1766. By the will of Maria Theresa a monument to his memory was erected in the church of the Augustinians, with an inscription styling him the "saviour of her states." In 1788 the 56th regiment of Austrian infantry was named after him. As a general Daun has been reproached for the dilatoriness of his operations, but wariness was not misplaced in opposing a general like Frederick, who was quick and unexpected in his movements beyond all precedent. Less defence perhaps may be made for him on the score of inability to profit by a victory.

See Der deutsche Fabius Cunctator, oder Leben u. Thaten S. E. des H. Leopold Reichsgrafen v. Daun K.K.F. (Frankfort and Leipzig, 1759-1760), and works dealing with the wars of the period.

**DAUOU, PIERRE CLAUDE FRANÇOIS** (1761–1840), French statesman and historian, was born at Bourgogne-sur-Mer, and after a brilliant career in the school of the Oratorians there, joined the order in Paris in 1777. He was professor in various seminaries from 1780 till 1787, when he was ordained priest. He was already known in literary circles by several essays and poems, when the revolution opened a wider career. He threw himself with ardour into the struggle for liberty, and refused to be
silenced in his advocacy of the civil constitution of the clergy by the offer of high office in the church. Elected to the Convention by Calais, he associated himself with the Girondists, but strongly opposed the death sentence on the king. He took little part in the struggle against the Mountain, but was involved in the overthrow of his friends, and was imprisoned for a year. In December 1794 he returned to the Convention, and was the principal author of the constitution of the year III. It seems to have been due to his Girondist ideas that the Ancients were given the right of convoking the corps législatif outside Paris, an expedient which made possible Napoleon's coup d'état of the 18th and 19th Brumaire. The creation of the Institute was also due to Daunou, who drew up the plan for its organization. His energy was largely responsible for the suppression of the royalist insurrection of the 19th Vendémiaire, and the important place he occupied at the beginning of the Directory is indicated by the fact that he was elected by twenty-seven departments as member of the Council of Five Hundred, and became its first president. He had himself set the age qualification of the directors at forty, and thus debarred himself as candidate, as he was only thirty-four. The direction of affairs having passed into the hands of Talleyrand and his associates, Daunou turned once more to literary temperament which would secure for him a commanding place in a revolutionary era. As an historian his breadth of view is remarkable for his time; for although thoroughly imbued with the classical spirit of the 18th century, he was able to do justice to the middle ages. His Discours sur l'état des lettres au XIIIe siècle, in the sixteenth volume of the Histoire littéraire de France, is a remarkable contribution to that vast collection, especially as coming from an author so profoundly learned in the ancient classics. Daunou's lectures at the Collège de France, collected and published after his death, fill twenty volumes (Cours d'études historiques, 1842–1846). They treat principally of the criticism of sources and the proper method of writing history, and occupy an important place in the evolution of the scientific study of history in France. All his works were written in the most elegant style and chaste diction; but apart from his share in the editing of the Historiens de la France, they were mostly in the form of separate articles on literary and historical subjects. Personally Daunou was reserved and somewhat austere, preserving in his habits a strange mixture of bourgeois and monk. His influence on his nephew, whom he had taken as archivist in the time when Napoleon was transferring so many treasures to Paris is not his least claim to the gratitude of scholars.

See Mignet, Notice historique sur la vie et les travaux de Daunou (Paris, 1843); Taillandier, Documents bibliographiques sur Daunou (Paris, 1847), including a full list of his works; Sainte-Beuve, Daunou in his Portraits Contemporains, t. iii. (unfavourable and somewhat unfair).

DAUPHIN (Lat. Delphinus), an ancient feudal title in France, borne only by the counts and dauphins of Vienne, the dauphins of Auvergne, and from 1364 by the eldest sons of the kings of France. The origin of this curious title is obscure and has been the subject of much ingenious controversy; but it now seems clear that it was in the first instance a proper name. Among the Norsemen, and in the counties of Normandy, England, and Flanders, it was the designation of a dolphin (dolf, "a wounding") was fairly common, e.g. in the north of England; thus a Donlin is mentioned among the tenants-in-chief in Domesday Book, and there was a Dolphin, lord of Carlisle, towards the end of the 11th century. It has thus been conjectured by some that the dauphins of Vienne derived their title from Teutonic sources through Germany. But in the south, too, the name—not necessarily derived from the same root—was not unknown, though exceedingly rare, and was moreover illustrated by two conspicuous figures in the Catholic martyrology: St Delphinus, bishop of Bordeaux from 380 to 404, and St Ouen, bishop of Lyons from c. 650 to 657. Whatever its origin, this name was borne by Guigo, or Guigue IV. (d. 1142), count of Albon and Grenoble, as an additional name, during the lifetime of his father, and was also adopted by his son Guigo V. Beatrix, daughter and heiress of Guige V., whose second husband was Hugh III., duke of Burgundy, bestowed the name on their son André, to recall his descent from the ancient house of the counts of Albon, and in the 14th century it was sometimes called sometimes Andreas Delphinus, sometimes Delphinus. His successors Guige VI. (d. 1270) and Guigue VII. (d. 1282) called themselves sometimes Delphinus, sometimes Delphinius, the name being obviously treated as a patronymic, and in the latter form it was borne by the sons of the reigning "dauphin." But even under Guige VI. foreigners had begun to confuse the name with a title of dignity, an imperial diploma of 1248 describing Guige as "Guigo Delphinus Vienennis." It was not until the third dynasty, founded by the marriage of Anne, heiress of John I., with Humbert, lord of La Tour du Pin, that "dauphin" became definitely established as a title. Humbert not only assumed the name of Delphinus, but styled himself regularly Dauphin of the Viennois (Delphinus Viennensis), and in a treaty concluded in 1285 between Humbert and Robert, duke of Burgundy, the word delphinatus (Dauphiné) appears for the first time, as a synonym for comitatus (county). In 1340 Humbert II., the last of his race, sold Dauphiné to Charles of Valois, who, when he became king of France in 1364, transferred it to his eldest son. From that time the eldest sons of the kings of France were always known as "the actual or titular dauphins of the Viennois. The "canting armes" of the dauphin of the Viennois, quartered with the royal fleurs de lis, were originally assumed by Dauphin, count of Clermont, instead of the arms of Auvergne (the earliest extant example is appended to a deed of 1199), and from them they were borrowed by the counts of the Viennois. Guige VI. used this device on his secret seal from his accession, the earliest extant example dating from 1237, but, though no specimens have survived, M. Prudhomme thinks it probable that the dolphin was also borne by André Dauphin. It was also assumed by Guige V., count of Forez (1203–1241), a descendant of Guige Raymond of the Viennois, count of Forez, in right of his wife Ida Raymonde. It is thus abundantly clear that the name of Dauphin was not assumed from the armorial device, but vice versa.

The eldest son of the French king was sometimes called "the king dauphin" (le roy dauphin), to distinguish him from the dauphin of Auvergne, who was known, since Auvergne became an appanage of the royal house, as "the prince dauphin." The "prince dauphin" of Auvergne, which is to be distinguished from the county, dates from the 13th century. William VIII. of Auvergne, was deposed by his uncle William VIII. "the Old." William VII, had married a daughter of Guige IV. Dauphin, after whose son was named Dauphin (Delphinus). The name continued, as in Viennois, as a patronymic, and was not used as a title until 1281, when Robert II., count of Clermont, in his will, styles himself for the first time Dauphin of Auvergne (Alvennis delphinus) for the portion of the county of Auvergne left to his house. In 1428 Jeanne, heiress of the dauphin Béraud III., married Louis de Bourbon, count of Montpensier (d. 1486), thus bringing the
DAUPHINÉ, DAVENANT, SIR W.

DAUPHINÉ, one of the old provinces (the name being still in current use in the country) of pre-Revolutionary France, in the south-east portion of France, between Provence and Savoy; since 1790 it forms the departments of the Isère, the Drôme and the Hautes Alpes.

After the death of the last king of Burgundy, Rudolf III., in 1322, the territories known later as Dauphiné (as part of his realm) reverted to the far-distant emperor. Much confusion followed, out of which the counts of Albon (between Valence and Vienne) gradually came to the front. The first dynasty ended in 1162 with Guigue V., whose daughter and heiress, Beatrice, carried the possessions of her house to her husband, Hugh III., duke of Burgundy. Their son, André, continued the race, this second dynasty making many territorial acquisitions, among them (by marriage) the Embrunais and the Gapenciais in 1322. In 1282 the Dauphiné dynasty ended in another heiress Anna, wife of Edward I. of England, who carried all to her husband, Humphrey, lord of La Tour-Foupin (between Lyons and Grenoble). The title of the chief of the house was Count (later Dauphin) of the Viennois, not of Dauphiné. (For the origin of the terms Dauphin and Dauphiné see Dauphin.)

Humbert II. (1333–1349), grandson of the heiress Anna, was the last independent Dauphin, selling his dominions in 1349 to Charles of Valois, who on his accession to the throne of France as Charles V. bestowed Dauphiné on his eldest son, and the title was borne by all succeeding eldest sons of the kings of France. In 1422 the Diois and the Valentinos, by the will of the last count, passed to the eldest son of Charles VI., and in 1424 were annexed to the Dauphiné. Louis (1440–1461), later Louis XI. of France, was the last Dauphin who occupied a semi-independent position, Dauphiné being annexed to the crown in 1456. The suzerainty of the emperor (who, in 1376, had named the Dauphin “Imperial Vicar” within Dauphiné and Provence) gradually died out. In the 16th century the names of the reformer Guillaume Farel (1489–1565) and of the duke of La Tour-Foupin (1543–1606) are prominent in Dauphiné history. The “States” of Dauphiné (dating from about the middle of the 14th century) were suspended by Louis XIII. in 1628, but their unauthorized meeting (on the 21st of July 1788) in the tennis court (Salle du Jeu de Paume) of the castle of Vizille, near Grenoble, was one of the earliest premonitory signs of the great French Revolution of 1789. It was at Laffrey, near Grenoble, that Napoleon (March 7th, 1815) was first acclaimed by his old soldiers sent to arrest him.

DAURAT (or DORAT), JEAN (in Lat. Auratus), (1568–1588), French poet and scholar; and member of the Péliade, was born at Limoges in 1568. His name was originally Diamandy. He belonged to a noble family, and, after studying at the college of Limoges, came up to Paris to be presented to Francis I., who made him tutor to his pages. He rapidly gained an immense reputation as a classical scholar. As a private tutor in the house of La Marde la Baïf, he had J. A. de Baïf for his pupil. His son, Louis, showed great precocity, and at the age of ten translated into French verse one of his father's Latin pieces; his poems were published with his father's. Jean Daurat became the director of the Collège de Coqueret, where he had among his pupils, besides Baïf, Ronsard, Remy, Belleau and Pantos de Tyard. Joachim du Bellay was added by Ronsard to this group; and these five young poets, under the direction of Daurat, formed a society for the reformation of the French language and literature. They increased their number to seven by the initiation of the dramatist Étienne Jodelle, and thereupon they named themselves La Péliade, in emulation of the seven Greek poets of Alexandria. The election of Daurat as their president proved the weight of his personal influence, and the value his pupils set on the learning to which he introduced them, but as a writer of French verse he is the least important of the seven. Meanwhile he collected around him a sort of Academy, and stimulated the students on all sides to a passionate study of Greek and Latin poetry. He himself wrote incessantly in both those languages, and was styled the 'father of French poetry.' His works are of considerable weight in the history of La Péliade. The works of the Péliade were edited by his son Jean Daurat, and also by J. Thévenot and by M. de Gourdon. The best of these he published at Paris in 1586 as J. Aurati Lernovici poetae et interpretis regii poëmatæ. He died at Paris on the 1st of November 1588, having survived all his illustrious pupils of the Péliade, except Pantos de Tyard. He was a little, restless man, of untiring energy, rustic in manner and appearance. His unequalled personal influence over the most graceful minds of his age gives him an importance in the history of literature for which his own somewhat vapid writings do not fully account.

The Œuvres poétiques in the vernacular of Jean Daurat were edited (1785) with biographical notice and bibliography by Ch. Marty-Laveaux in his Péliade française.

DAVENANT, CHARLES (1656–1714), English economist, eldest son of Sir William Davenant, the poet, was born in London, and educated at Cheam grammar school and Balliol College, Oxford, but left the university without taking a degree. At the age of nineteen he had composed a tragedy, Circe, which met with some success, but he soon turned his attention to law, and having taken the degree of L.L.D., he became a member of Doctors' Commons. He was member of parliament successively for St Ives, Cornwall, and for Great Bedwyn. He held the post of commissioner of excise from 1683 to 1689, and that of inspector-general of exports and imports from 1705 till his death in 1714. He was also secretary to the commission appointed to treat for the union with Scotland. As an economist, he must be classed among his strong supporter of the pre-Revolutionary theory, and in his economic pamphlets and distinct from his political writing; he takes up an eclectic position, recommending governmental restrictions on colonial commerce as strongly as he advocates freedom of exchange at home. Of his writings, a complete edition of which was published in London in 1771, the following are the more important:—An Essay on the East India Trade (1697); Two Discourses on the Public Revenues and Trade of England (1698); An Essay on the probable means of making the people gainers in the balance of Trade (1699); A Discourse on Grants and Resumptions and Essays on the Balance of Power (1701).

DAVENANT (or D'AVENANT), SIR WILLIAM (1666–1668), English poet and dramatist, was baptized on the 3rd of March 1660; he was born at the Crown Inn, Oxford, of which his father, a wealthy vintner, was proprietor. It was stated that Shakespeare always stopped at this house in passing through the city of Oxford, and out of his known or rumoured admiration of the hostess, a very fine woman, there sprang a scandalous story which attributed Davenant's paternity to Shakespeare, a legend which there is reason to believe Davenant himself encouraged.
but which later criticism has cast aside as spurious. In 1621 the vintner was made a member of Oxford, and in the same year his son left grammar school of All Saints, where his master had been Edward Sylvester, and was entered an undergraduate of Lincoln College, Oxford. He did not stay at the university, however, long enough to take a degree, but was hurried away to appear at court as a page, in the retinue of the gorgeous duchess of Richmond. From her service he passed into that of Fulke Greville, Lord Brooke, in whose house he remained until the murder of that eminent man in 1628. This blow threw him upon the world, not altogether without private means, but greatly in need of a profitable employment.

He turned to the stage for subsistence, and in 1629 produced his first play, the tragedy of Albion. It was not a very brilliant performance, but it pleased the town, and decided the poet to pursue a dramatic career. The next year saw the production at Blackfriars of The Cruel Brother, a tragedy, and The Just Italian, a tragi-comedy. Inigo Jones, the court architect, for whom Ben Jonson had long supplied the words of masques and complimentary pieces, quarrelled with his great colleague in the year 1634, and applied to Davenant for verses. The result was The Temple of Love, performed by the queen and her ladies at Whitehall on Shrove Tuesday, 1614, and printed in that year. Another masque, The Triumphs of the Prince D’Amour, followed in 1636. The poet returned to the legitimate drama by the publication of the tragi-comedy of The Platonic Lovers, and the famous comedy of The Wits, in 1636, the latter of which, however, had been licensed in 1633. The masque of Britannica Triumphant (1637) brought him into some trouble, for it was suppressed as a punishment for its first performance having been arranged for a Sunday. By this time Davenant had, however, thoroughly ingratiated himself with the court; and on the death of Ben Jonson in 1637 he was rewarded with the office of poet-laureate, to the exclusion of Thomas May, who considered himself entitled to the honour. It was shortly after this event that Davenant collected his minor lyrical pieces in a volume entitled Madagascar and other Poems (1638); and in 1639 he became manager of the new theatre in Drury Lane. The civil war, however, put a check upon this prosperous career; and he was among the most active partisans of royalty through the whole of that struggle for supremacy.

As early as May 1642, Davenant was accused before the Long Parliament of being mainly concerned in a scheme to seduce the army to overthrow the Commons. He was accordingly apprehended at Faversham, and imprisoned for two months in London; he then attempted to escape to France, and succeeded in reaching Canterbury, where he was recaptured. Escaping a second time, he made good his way to the queen, with whom he remained in France until he volunteered to carry over to England some military stores for the army of his old friend the Earl of Newcastle, by whom he was induced to enter the service as lieutenant-general of ordnance. He acquitted himself with so much bravery and skill that, after the siege of Gloucester, in 1643, he was knighted by the king. After the battle of Naseby he retired to Paris, where he became a Roman Catholic and spent some months in the composition of his epic poem of Gondibert. In 1646 he was sent by the queen on a mission to Charles I., then at Newcastle, to advise him to “part with the church for his peace and security.” The king dismissed him with some sharpness, and Davenant returned to Paris, where he was the guest of Lord Jermyn. In 1650 he took the command of a colonizing expedition that set sail from France to Virginia, but was captured in the Channel by a parliamentary man-of-war, which took him back to the Isle of Wight. Imprisoned in Cowes castle until 1651, he tempered the discomfort and suspense of his condition by continuing the composition of Gondibert. He was sent up to the Tower to await his trial for high treason, but just as the storm was about to break over his head, all cleared away. It is believed that the personal intercession of Milton led to this result. Another account is that he was released by the desire of two aldermen of York, once his prisoners, whom he had allowed to escape. Davenant, released from prison, immediately published Gondibert, the work on which his fame mainly rests, a chivalric epic in the four-line stanza which Sir John Davies had made popular by his Nosce teipsum, the influence of which is strongly marked in the philosophical passages of Gondibert. It is a curious, dull production, but is relieved with a multitude of fine and felicitous passages, and lends itself most happily to quotation.

During the civil war one of his plays had been printed, the tragedy of The Unfortunate Lovers, in 1643. One of his best plays, Love and Honour, was published in 1649, but appears to have been acted long before. He found that there were many who desired him to recommence his theatrical career. Such a step, however, was absolutely forbidden by Puritan law. Davenant, therefore, by the help of some influential friends, obtained permission to open a sort of theatre at Rutland House, in Charterhouse Yard, where, on the 21st of May 1656, he began a series of representations, which he called operas, as an inoffensive term. This word was then first introduced into the English language. The opening piece was a kind of dialogue defending the drama in the abstract. This was followed by his own Siege of Rhodes, printed the same year, which was performed with stage decorations and machinery of a kind hitherto quite unthought of in England. Two other innovations in its production were the introduction of recitative and the appearance of a woman, Mrs Coleman, on the stage. He continued until the Restoration to produce ephemeral works of this kind, only one of which, The Cruelty of the Spaniards in Peru, in 1658, was of sufficient literary merit to survive. In 1660 he had the infinite satisfaction of being able to preserve the life of that glorious poet who had, nine years before, saved his own from a not less imminent danger. The mutual relations of Milton and Davenant do honour to the generosity of two men who, sincerely opposed in politics, knew how to forget their personal anger in their common love of letters. In 1659 Davenant suffered a short imprisonment for complicity in Sir George Booth’s revolt. Under Charles II. Davenant flourished in the dramatic world; he opened a new theatre in Lincoln’s Inn Fields, which he called the Duke’s; and he introduced a luxury and polish into the theatrical life which it had never before known in England. Under his management, the great actors of the Restoration, Betterton and his coevals, took their peculiar French style and appearance; and the ancient simplicity of the English stage was completely buried under the tinsel of decoration and splendid scenery. Davenant brought out six new plays in the Duke’s Theatre, The Rivals (1668), an adaptation of The Two Noble Kinsmen, which Davenant never owned, The Man’s the Master (1669), comedies translated from Scarron, News from Plymouth, The Distresses, The Siege, The Fair Favourite, tragi-comedies, all of which were printed after his death, and only one of which survived their author on the stage. He died at his house in Lincoln’s Inn Fields on the night of the 7th of April 1668, and two days afterwards was buried in Poets’ Corner, Westminster Abbey, with the inscription “O rare Sir William Davenant!” In 1672 his writings were collected in folio. His last work had been to travestie Shakespeare’s Tempest in 45 parts with Dryden.

The personal character, adventures and fame of Davenant, and more especially his position as a leading reformer, or rather debaser, of the stage, have always given him a prominence in the history of literature which his writings hardly justify. His plays are utterly unreadable, and his poems are usually stilted and unnatural. With Cowley he marks the process of transition from the poetry of the imagination to the poetry of the intelligence; but he had far less genius than Cowley, and his influence on English drama must be condemned as wholly deplorable.

(E. G.)

Davenport, Edward Loomis (1816-1877), American actor, born in Boston, made his first appearance on the stage in Providence in support of Junius Brutus Booth. Afterwards he went to England, where he supported Mrs Anna Cora Mowatt (Ritchie) (1819-1870), Macready and others. In 1854 he was again in the United States, appearing in Shakespearian plays and in dramatizations of Dickens’s novels. As Bill Sykes he was
DAVENPORT, R.—DAVID

especially successful, and his Sir Giles Overreach and Brutus were also greatly admired. He died at Canton, Pennsylvania, on the 1st of September 1877. In 1849 he had married Fanny Vining (Mrs Charles Gill) (d. 1891), an English actress also in Mrs Mowatt's company. Their daughter FANNY (LILY GIPSY) Davenport (1850-1898) appeared in America at the age of twelve as the king of Spain in Faint Heart Never Won Fair Lady. Later (1889) she was a member of Daly's company; and afterwards, with a company of her own, acted with especial success in Sardou's Féodore (1883), Cleopatra (1890), and similar plays. Her last appearance was on the 25th of March 1898, shortly before her death.

DAVENPORT, ROBERT (fl. 1623-1630), English dramatist, is mentioned as the author of a play licensed in 1624 under the title of Henry I. In 1653 Henry I. and Henry II. was entered at Stationers' Hall by Humphrey Moseley with a second part said to be the work of Davenport and Shakespeare. Of this play or plays nothing has been discovered, but King John and Matilda (printed 1655), which probably dates from about the same time, has survived. Throughout the play, as in its closing scene quoted by Charles Lamb in his Dramatic Specimens, there is much "passion and poetry" which saves the piece from being classed as pure melodrama. The City-Night-Cap was licensed in 1624, but not printed until 1661. The underplot of this unsavoury play was borrowed from Cervantes and Boccaccio, and Mrs Aphra Behn's Amorous Prince (1671) is an adaptation from it. A New Trick to Cheat the Devil (printed 1639) is a farcical comedy, which contains among other things the idea of the popular supper story which reappears in Hans Andersen's Little Claus and Big Claus. As told by Davenport the story closely resembles the Scottish Freires of Berwick, which was printed in 1603. Three other plays entered in the Stationers' Register as Davenport's are lost, and he collaborated in two plays with Thomas Drue.

Davenport's plays were reprinted by A. H. Bullen in Old English Plays (1838-1890). The volume includes two didactic poems, which first saw the light in 1623.

DAVENPORT, a city and the county seat of Scott county, Iowa, U.S.A., on the Mississippi river, opposite Rock Island, Illinois, with which it is connected by two fine bridges and by a ferry. It is the third largest city in the state. Pop. (1890) 26,872; (1900) 35,254, including 8479 foreign-born (5111 German), and 16,230 of foreign parentage (13,204 German); (1905, state census) 39,797; (1910) 43,028. Davenport is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St Paul, the Chicago, Rock Island & Pacific, the Iowa & Illinois (interurban), and the Davenport, Rock Island & North Western railways; opposite the city is the western terminus of the Illinois and Mississippi, or Hennepin, Canal (which connects the Mississippi and Illinois rivers). Davenport lies on the slope of a bluff affording extensive views of landscape and river scenery. In the city are an excellent public library, an Academy of Sciences, seven churches and other German social organizations, the Iowa soldiers' orphans' home, Brown business college, and several minor Roman Catholic institutions. Davenport is an episcopal see of the Roman Catholic and the Protestant Episcopal churches. The city has a large commerce, and trade by water and rail in coal and grain, which are produced in the vicinity, is of special importance. With Rock Island and Moline it forms one great commercial unit. Among Davenport's manufactures are the products of foundries and machine shops, and of flouring, grist and planing mills; sugar syrup and products; locomotives, steel cars and car parts, washing machines, waggons, carriages, agricultural implements, buttons, macaroni, crackers and brooms. The value of the total factory product for 1905 was $13,695,978, an increase of 38.7% over that of 1900. Davenport was founded in 1835, under the leadership of Colonel George Davenport; it was incorporated as a town in 1838, and was chartered as a city in 1851.

DAVENDY, a market town and municipal borough in the Southern parliamentary division of Northamptonshire, England, 74 m. N.W. from London, by the London & North Western railway. Pop. (1901) 3780. It is picturesquely situated on a sloping site in a rich undulating country. On the adjacent Borough Hill are extensive earthworks, and the discovery of remains here and at Burnt Walls, immediately south, proves the existence of a considerable Roman station. The chief industry of the town is the manufacture of boots and shoes. The borough is under a mayor, four aldermen and twelve councillors. Area, 3633 acres.

In spite of the Roman remains on Borough Hill, nothing is known of the town itself until the time of the Domesday Survey, when the manor consisting of eight hides belonged to the countess Judith, the Conqueror's niece. According to tradition, Davenery was created a borough by King John, but there is no extant charter before that of Elizabeth in 1576, by which the town was incorporated under the name of the bailiff, burgesses and commonalty of the borough of Davenery. The bailiff was to be chosen every year in the Moot Hall and to be assisted by fourteen principal burgesses and a recorder. James I. confirmed this charter in 1605-1606, and Charles II. in 1674-1675 granted a new charter. The "quo warranto" rolls show that a market every Wednesday and a fair on St Augustine's day were granted to Simon son of Walter by King John. The charter of 1576 confirms this market and fair to the burgesses, and grants them two new fairs each continuing for two days, on Tuesday after Easter and on the feast of St Matthew the Apostle. Wednesday is still the market day. The town was an important coaching centre, and there was a large local industry in the manufacture of wigs. During the civil wars Davenery was the headquarters of Charles I. in the summer of 1645, immediately before the battle of Naseby, at which he was defeated. A Cluniac priory founded here shortly after the Conquest has left no remains.

DAVEY OF FERNHURST, HORACE DAVEY, BARON (1833-1907), English judge, son of Peter Davey, of Horton, Bucks, was born on the 30th of August 1833, and educated at Rugby and University College, Oxford. He took a double first-class in classics and mathematics, was senior mathematical scholar and Eldon law scholar, and was elected a fellow of his college. In 1861 he was called to the Bar at Lincoln's Inn, and read in the chambers of Mr (afterwards Vice-Chancellor) Wicken. Devoting himself to the Chancery side, he soon acquired a large practice, and in 1875 became a Q.C. In 1880 he was returned to parliament as a Liberal for Christchurch, Hants, but lost his seat in 1885. On Gladstone's return to power in 1886 he was appointed solicitor-general and was knighted, but had no seat in the House, being defeated at both Ipswich and Stockport in 1886; in 1888 he found a seat at Stockton-on-Tees, but was rejected by that constituency in 1892. As an equity lawyer Sir Horace Davey ranked among the finest intellects and the most subtle pleaders ever known at the English bar. He was standing counsel to the university of Oxford, and senior counsel to the Charity Commissioners, and was engaged in all the important Chancery suits of his time. Among the chief leading cases in which he took a prominent part were those of The Mogul Steamship Company v. Mary, 1871; Borrill v. Coats, 1884, Erlanger v. New Sombrero Company, 1878, and the Oregum Gold Mines Company v. Cooke, 1892; he was counsel for the promoters in the trial of the bishop of Lincoln, and leading counsel in the Berkeley peerage case. In 18626 he married Miss Louisa Donkin, who, with two sons and four daughters, survived him. In 1893 he was raised to the bench as a lord justice of appeal, and in the next year was made a lord of appeal in ordinary and a life peer. He died in London on the 20th of February 1907. Lord Davey's great legal knowledge was displayed in his judgments no less than at the bar. In legislation he took no conspicuous part, but he was a keen promoter of the act passed in 1900 for the checking of gambling.

DAVID (A Hebrew name meaning probably beloved 1), in the Bible, the son of Jesse, king of Judah and Israel, and founder of the royal Judaean dynasty at Jerusalem. The chronology of his period is uncertain: the usual date, 1055-1015 B.C., is probably

1 See further the third edition of Schrader's Keilinschr. u. das Alle Text. pp. 225, 483.
thirty years to half a century too early. The books of Samuel (strictly, 1 Sam. vii.–xi Kings ii.), which are our principal source for the history of David, show how deep an impression the personality of the king, his character, his genius and the romantic story of his early years had left on the mind of the nation. Of no hero of antiquity do we possess so life-like a portrait. Minute details and traits of character are portrayed with a vividness which bears all the marks of contemporary narrative. But the record is by no means all of one piece or of one date. This history, as we now have it, is extracted from various sources of unequal value, which are fitted together in a way which offers considerable difficulties to the critic. In the history of David’s early adventures, for example, the narrative is not seldom disordered, and sometimes seems to repeat itself with puzzling variations of detail, which have led critics to the unanimous conclusion that the First Book of Samuel is drawn from at least two sources. It is indeed easy to understand that the romantic incidents of this period were much in the mouths of the people—to whom David was a popular hero—and in course of time were written down in various forms which were not combined into perfect harmony by later editors, who gave excerpts from several sources rather than a new and independent history. These excerpts, however, have been so pieced together, that it is often impossible to make any clear distinction, and to distinguish accurately between earlier and later elements. It can be inferred from a study of the Greek text that some copies of the books of Samuel incorporated narratives which other copies did not acknowledge. For the literary problems of these books, see also Samuel (Books).

The parallel history of David in 1 Chron. xi.–xxix. contains a great deal of additional matter, which can rarely be treated as of equal historical value with the preceding. Where it follows the chapters in Samuel it is important for textual and other critical problems, but it omits narratives in which it is not interested (David’s youth, persecution by Saul, Absalom’s revolt, &c.), and adds long passages (David’s arrangements for the temple, &c.) which reflect the views of a much later age than David’s. The lists of officers, &c., are fuller than those in Samuel, and here and there contain notices of value. A comparison of the two records, however, is especially important for its illustration of the later tendency to idealize the figure of David, and the historical critic has to bear in mind the possibility that this tendency had begun long before the Chronicler’s time, and that it may be found in the relatively older records preserved in Samuel.

David’s father, Jesse, was a citizen of Bethlehem in Judah, 5 m. south of Jerusalem; the poetical deprecation in 1 Sam. xviii. 18 means little (cf. Saul in ix. 21). Tradition made him a descendant of the ancient nobles of Judah through Boaz and the Moabitess Ruth, but the tendency to furnish a noble ancestry for a noble figure—especially one of obscure birth—is widespread (cf. Genealogy).

He was the youngest of eight sons, was born to his youth in an occupation which the Hebrews as well as the Arabs seem to have held in low esteem. He kept his father’s sheep in the desert, and there developed the strength, agility, endurance and courage which distinguished him throughout life (cf. 1 Sam. xvii. 34, xxiv. 2; 2 Sam. xvii. 9). There, too, he acquired that skill in music which led to his first introduction to Saul (1 Sam. xvi. 14–23), and the apocryphal Psalm of David, Ps. cl. in the Septuagint). He found favour in the king’s eye, and became his armour-bearer. But traditions varied. In 1 Sam. xvii. he does not follow his master to the field against the Philistines; he is an obscure untried shepherd lad sent by his father with supplies for his brothers in the Israelite camp. He does not even present himself before the king, and his brothers treat him with a petulance hardly conceivable if he stood well at court, and it appears from the close that neither Saul nor his captain Abner had heard of him before (vv. 55–58). There is, indeed, a flat contradiction between the two accounts, but a family of Greek MSS. represented by the Vatican text omit xii. 12–13, xvii. 55–58, and thus the difficulty is greatly lessened. Characteristic of the omitted portions are the friendship which sprang up between Jonathan and David and the latter’s appointment to a command in the army. A further difficulty is caused by 2 Sam. xxii. 19, which makes Elhanan the slayer of Goliath. David’s exploit is not referred to in 2 Sam. xxii. 10–15, xxix., and on this and other grounds the simpler tradition in 2 Sam. is usually preferred. (See Gollath.) But it must have been by some valiant deed that Saul was led to notice him (cf. xiv. 52), and David soon became both a popular hero and an object of jealousy to Saul. According to the Hebrew text of 1 Sam. xviii., Saul’s jealousy leaped at once to the conclusion that David’s ambition would not stop short of the kingship. Such a suspicion would be intelligible if we could suppose that the king had heard something of the significant act of Samuel, which now stands at the head of the history of David in witness of that divine election and union with the spirit of Yahweh on which his whole career hung (xvi. 1–13). But this passage is the sequel to the rejection of Saul in xv., where Samuel’s position agrees with that of the late writer in viii. and xii.

The shorter text, represented by the Septuagint, gives an account of Saul’s jealousy which is psychologically more intelligible. According to this text Saul was simply possessed with such a personal dislike and dread of David as might easily occupy his disordered brain. To be quit of his hateful presence he gave him a military command. In this charge David increased his reputation as a soldier and became a general favourite. Saul’s daughter Michal loved him; and her father, whose jealousy continued to increase, resolved to put the young captain on a perilous enterprise, promising him the hand of Michal as a reward of success, but secretly hoping that he would perish in the attempt. David’s good fortune did not desert him; he won his wife, and in this new advancement continued to grow in the popular favour, and to gain fresh laurels in the field. At this point it is necessary to look back on the proposed marriage of David with Saul’s eldest daughter Merab (xvi. 17–19; cf. xvi. 25). When the time came for Saul to fulfil his promise, Merab was given in marriage to Adriel the Arbattite (xviii. 25). What is said of this affair interrupts the original context of chap. xviii., to which the insertion has been clumsily fitted by an interpolation in the second half of ver. 21 (LXX omits). We have here, therefore, a notice drawn from a distinct source which connects itself with the other omitted passage, xvii. 12–31, where Saul had promised his daughter to the one who should overthrow Goliath (ver. 25). Since Merab and Michal are confounded in 2 Sam. xxi. 8, the whole episode of Merab and David perhaps rests on a similar confusion of names.

As the king’s son-in-law, David was necessarily again at court. He became chief of the bodyguard, as Ewald rightly interprets 1 Sam. xxii. 14–15, and ranked next to Abner (xx. 25), so that Saul’s insane fears were constantly exasperated by personal contact with him. On at least one occasion the king’s frenzy broke out in an attempt to murder David with his own hand. At another time Saul actually gave commands to assassinate his son-in-law, but the breach was made up by Jonathan, whose chivalrous spirit had united him to David in a covenant of closest friendship (xix. 1–7). The circumstances of the final overthrow of Saul’s hatred, which drove David into exile, are not easily disentangled.

1 See Samuel. The older history repeatedly indicates that David’s kingship was predicted by a divine oracle, but would hardly lead us to place the prediction so early (1 Sam. xxv. 30; 2 Sam. iii. 9, v. 2).
2 The LXX omits xviii. 1–6 (to “Philistian”), the first and last clauses of 8, 10–11, the reason given for Saul’s fear in 12, 17–19, the second half of 21. It also modifies 28, and omits the second half of 29 and the whole of 30.
3 Some textual variants, xvi. 20, are wanting in the Greek, and in the light of subsequent events is improbable. Its aim is to paint Saul’s character as black as possible.
The connexion, certainty, verse which the Kirsch, Semit. with in redoubtable life find consecrated feelings, than the connexion is as a thief even among the Arabs.\(^1\) David's daring spirit might very well lead him to visit his wife even after his first flight. The danger of such an enterprise was diminished by the reluctance to violate the apartments of women and attack a sleeping foe, which appears also in Judges xvi. 2, and among the Arabs.\(^2\)

According to chap. xx. David was still at court in his usual position when he became certain that the king was aiming at his life. He betook himself to Jonathan, who thought his suspicions groundless.\(^3\) But he spoke in a way which he knew would be understood in a way which Jonathan should draw from the king an expression of his feelings, and a tremendous explosion revealed that Saul regarded David as the rival of his dynasty, and Jonathan as little better than a fellow-conspirator. After a final interview (xx. 40-42), which must be regarded as a later expansion, they parted and David fled. He sought the sanctuary at Nob, where he had been wont to consult the priestly oracle (xxii. 13), and, concealing his disgrace by a fictitious story, he also obtained bread from the consecrated table and the sword of Goliath (chap. xxi. 1-9).\(^4\) His hasty flight—without food and weapon—suggests that the narrative should follow upon xiii. 17.

It was perhaps after this that David made a last attempt to find a place of refuge in the prophetic circle of Samuel at Ramah (xix. 19-24). The episode now stands in another connexion, where it certainly out of place. It might, however, fit into the break that plainly exists in the history at xx. 10 after the affair at Nob. Deprived of the protection of religion as well as of justice, David tried his fortune among the Philistines at Gath. Recognized and suspected as a redoubtable foe, he made his escape by feigning madness, which, in the East is inviolable privileges (xxi. 11-16).\(^5\) The passage anticipates chap. xxviii., and it is hardly probable that the sayer of Goliath or of any other Philistine giant fled to the Philistines with their dead hero's sword. He returned to the wilds of Judah, and was joined at Adullam\(^6\) by his father's house and by a small band of outlaws, of which he became the head. Placing his parents under the charge of the king of Moab, he took up the life of a guerilla captain, cultivating friendly relations with the townships of Judah (xx. 25), which were glad to have on their frontier a protector so valiant as David, whose expense of the blackmail which he devised in return. A clear conception of his life at this time, and of the respect which he inspired by the discipline in which he held his men, and of the generosity which tempered his fiery nature, is given in chap. xxv. His force gradually swelled, and he was joined by the prophet Gad (note his message xxii. 5) and by the priest Abiathar, the only survivor of a terrible massacre by which Saul took revenge for the favours which David had received at the sanctuary of Nob. He was even able to strike at the Philistines, and to rescue Kílías\(^7\) (south of Adullam and to the east of Beit Jibrín) from their attack on the Amalekites (xxi. 7-15). Forced to flee by the treachery of the very men whom he had succored, he lived for a time in constant fear of being captured by Saul, and at length took refuge with Achish king of Gath and established himself in Ziklag. Popular tradition, as though unwilling to let David escape from Saul, told of that king's continual pursuit of the outlaw, of the attempt of the men of Ziph (S.E. of Hebron) to betray him, of David's magnanimity displayed on two occasions, and of Jonathan's visit to console his bosom friend (xxiv.-xxvi.).\(^8\) The situation was one which lent itself to the imagination.

The site of Ziklag is unknown. It hardly lay near Gath (probably Tell es-Safi, 12 m. E. of Ashdod), but rather to the south of Judah (Josh. xix. 5). Here he occupied himself in chastening the Amalekites and other robber tribes who made raids on Judah and the Philistines without distinction (xxvii.). The details of the text are obscure, and seem to imply that David was joined by a guerilla party which had been perhaps pretending that he had been making forays against Judah. If this were an attempt to steer a middle course his true actions could not have been kept secret long, and as it is implied that the Philistines subsequently acquiesced in David's sovereignty in Hebron, it is not easy to see what interest they had in embroiling him with the men of Judah. At length, in the second year, he was called to join his master in a great campaign against Saul. The Philistines for once directed their forces against the plain of Jezreel (Esdraelon) in the north; and Saul, forsaken by Yahweh, already gave himself up for lost. David accompanied the army as a matter of course. But his presence was not observed until they reached their destination, when the jealousy of the Philistines overrode his protestations of fidelity and he was ordered to return. He reached Ziklag only to find the town pillaged by the Amalekites. Pursuing the foes, he inflicted upon them a signal chastisement and took a great booty, part of which he spent in polit gifts to the leading men of the towns in the south country.\(^9\)

Meantime Saul had fallen in battle, and northern Israel was in a state of chaos. The Philistines took possession of the fertile lowlands of Jezreel and the Jordan, and the shattered forces of Israel were slowly rallied by Abner in the remote city of Mahanaim in Gilead, under the nominal sovereignty of Saul's son Ishbaal. David now took the first great step to the throne. He was no longer an outlaw with a band of wandering companions, but a petty chieftain, head of a small colony of men, allied with families of Caleb and Jezreel (in Judah), and on friendly footing with the sheikhs south of Hebron. In response to an oracle he was bidden to move northwards to Judah, and to put himself at the head of the Amalekites. There he was anointed king, the first ruler of the southern kingdom.

If the chronological notice may be trusted, he was then thirty years of age, and he reigned there for seven and a half years (2 Sam. ii. 1-4, 11, v. 4 sq.). The noble eulogy on the death of Saul and Jonathan, quoted from the Book of Jashar (2 Sam. i.), is marked by the absence both of religious feeling and of allusions to his earlier experiences with Saul which David might have been expected to make. It was deemed only natural that he should sympathize deeply with the disasters of the northern kingdom. His vengeance on the Amalekite who slew Saul—the account is a doublur of 1 Sam. xxxi.—is consistent with his generous treatment of his late adversary in his outlaw life, and with this agrees his embassy of thanks to the men of Jabesh-Gilead for their chivalrous rescue of the bodies of the fallen heroes (2 Sam. ii. 18-7). The embassy threw out a hint—theri lord was dead and David had not been anointed king over Judah; but the relation between Jabesh-Gilead and Saul had been a close one, and it was not to be expected that its eyes would be turned upon the king of Judah when Saul's son was installed at the not distant Mahanaim.

According to a late Rabbinical story, David, like Bruce of Scotland, was once saved by a spider which spun its web over the cave wherein he was concealed.

The law of the distribution of booty after war enacted by David (xxiv. 19 sqq.) is attested among the Semitic and Aramaic languages (Num. xxxi. 27). On the importance of this explicit statement, see W. R. Smith, Old Test. in Jewish Church (P), 386 sq.
The interest of the narratives is now directed away from the Philistines to the decaying fortunes of Saul's house. (See Abner and Saul). Saul's son, Ishbaal, and his authority were gradually consolidated in the north. War broke out between the two parties at Gibeon a few miles north of Jerusalem. A sham contest was changed into a fatal fray by the treachery of Ishbaal's men; and in the battle which ensued Abner was not only defeated, but, by slaying Asahel, drew upon himself a blood-feud with Joab. The war continued. Ishbaal's party became weaker and weaker; and at length Abner quarrelled with his nominal master and offered the kingdom to David. The king seized the opportunity to demand the return of Michal, his wife. The passage (iii. 12-16) is not free from difficulties, but it is intelligible that David should desire to ally himself as closely as possible with Saul's family (cf. xii. 8). The base murder of Abner by Joab did not long defray the inevitable issue of events. Ishbaal lost hope, and after he had been foully assassinated by two of his own followers, all Israel sought David as king.

The biblical narrative is admitted not so constructed as to enable us to describe in chronological order the thirty-three years of David's reign over all Israel. It is possible that some of the incidents ascribed to this period properly belong to an earlier part of his life, and that tradition has idealized the life of David the king even as it has not failed to colour the history of David the outlaw and king of Hebron.

In the preceding account the biblical narratives have been followed as closely as the light of the critical researches generally accepted. That they have been affected by the growth of popular tradition is patent from the traces of duplicate narratives, from the difficulty caused, for example, by the names David and Goliath (vii. 3), and from a study of the chapters. The later views of the history of this period are represented in the book of Chronicles, where immediately after Saul's death David is anointed at Hebron king over all Israel (1 Chron. xi.). It is quite in harmony with this that the name source speaks of a number of Israelites who joined David at Ziklag (1 Chron. xii. 1-22), and of the host which came to him at Hebron to turn over to him Saul's kingdom (xii. 23-40). This treatment of history can be at once corrected by the books of Samuel, but it is only from a deeper study of the internal evidence that these, too, appear to give expression to doubtful and conflicting views. It is questionable whether David could have become king over all Israel immediately after the death of Ishbaal. The chronological notices in ii. 10 sqq. allow an interval of five or six years, and two or three events of these years appear to be recorded. But David's position in the south of Judah is clear. He is related by marriage with south Judaeans clans of Caleb, Jezreel, and probably Gushur. (See ABASA.)

He was at the head of a small colony (1 Sam. xxvi. 3), and his friends were the Ishmaelites, the Wilderness borns. His step forward to Hebron is in every way intelligible and is the natural outcome of his policy. It is less easy to trace his previous moves. There are gaps in the narratives, and the further back we proceed the more serious do their difficulties become. These chapters bring him farther north, and they commence by depicting David as a man of Bethel, high in the court of Saul, the king's son-in-law, and a popular favourite with the people. But notwithstanding this, the relation is a close one, and even David's entry into the Hebrws of north Israel, the weakness of the union being proved by the ease with which it was subsequently broken after Solomon's death. Much of the life of Saul is obscure, and this, too, it would seem, because tradition loved rather to speak of the life of David or of the character of his successful rival (See SAUL.). It is not impossible that some traditions did not bring them together. If Jerusalem and its immediate neighbourhood were first conquered by David (2 Sam. v.), it is probable that Bethel and Gibeah fell to his lot. The two villages, the Jebusite capital, and the home of the family of Saul, which had been a refuge for his father-in-law, were probably taken by Hebron. (Judg. i. 35), Gezer (ib. i. 29), Chephirah and Kirjath-jearim (Jos. ix. 17) had remained Canaanite. The evidence has obviously some bearing upon the history of Saul, as also upon the intercourse between Judah and the Philistines. When David was anointed he had been consecrated, therefore, that David's original home lay in the south. Since the early historical narrative (1 Sam. xxv. 2) finds him in Maon, Winckler has suggested that he was a Calebite chief, while the later notices fail to indicate the king's father. The chronicler Marquet 2 to conjecture that he was born at Arad (Tell 'Arad).

1 Bethel (ver. 27) is probably the Bethel near Ziklag (1 Chron. iv. 30). David's friendly relations with the Philistines find a parallel in Isaac's covenant with Abimelech (q.v.). In P's xxiv. the latter name actually appears in place of Achish.

2 Fundamenta israel. u. jüdis. Gesch. (1896), pp. 23 sqq.; see also Winckler, Gesch. isr. i. 24; Keil u. d. Alte Test.v. 2, p. 228 sqq.

The interest of the narratives is now directed away from the Philistines to the decaying fortunes of Saul's house. (See Abner and Saul). Saul's son, Ishbaal, and his authority were gradually consolidated in the north. War broke out between the two parties at Gibeon a few miles north of Jerusalem. A sham contest was changed into a fatal fray by the treachery of Ishbaal's men; and in the battle which ensued Abner was not only defeated, but, by slaying Asahel, drew upon himself a blood-feud with Joab. The war continued. Ishbaal's party became weaker and weaker; and at length Abner quarrelled with his nominal master and offered the kingdom to David. The king seized the opportunity to demand the return of Michal, his wife. The passage (iii. 12-16) is not free from difficulties, but it is intelligible that David should desire to ally himself as closely as possible with Saul's family (cf. xii. 8). The base murder of Abner by Joab did not long defray the inevitable issue of events. Ishbaal lost hope, and after he had been foully assassinated by two of his own followers, all Israel sought David as king.

The biblical narrative is admittedly not so constructed as to enable us to describe in chronological order the thirty-three years of David's reign over all Israel. It is possible that some of the incidents ascribed to this period properly belong to an earlier part of his life, and that tradition has idealized the life of David the king even as it has not failed to colour the history of David the outlaw and king of Hebron.

In the preceding account the biblical narratives have been followed as closely as the light of the critical researches generally accepted. That they have been affected by the growth of popular tradition is patent from the traces of duplicate narratives, from the difficulty caused, for example, by the names David and Goliath (vii. 3), and from a study of the chapters. The later views of the history of this period are represented in the book of Chronicles, where immediately after Saul's death David is anointed at Hebron king over all Israel (1 Chron. xi.). It is quite in harmony with this that the name source speaks of a number of Israelites who joined David at Ziklag (1 Chron. xii. 1-22), and of the host which came to him at Hebron to turn over to him Saul's kingdom (xii. 23-40). This treatment of history can be at once corrected by the books of Samuel, but it is only from a deeper study of the internal evidence that these, too, appear to give expression to doubtful and conflicting views. It is questionable whether David could have become king over all Israel immediately after the death of Ishbaal. The chronological notices in ii. 10 sqq. allow an interval of five or six years, and two or three events of these years appear to be recorded. But David's position in the south of Judah is clear. He is related by marriage with south Judaeans clans of Caleb, Jezreel, and probably Gushur. (See ABASA.)

He was at the head of a small colony (1 Sam. xxvi. 3), and his friends were the Ishmaelites, the Wilderness borns. His step forward to Hebron is in every way intelligible and is the natural outcome of his policy. It is less easy to trace his previous moves. There are gaps in the narratives, and the further back we proceed the more serious do their difficulties become. These chapters bring him farther north, and they commence by depicting David as a man of Bethel, high in the court of Saul, the king's son-in-law, and a popular favourite with the people. But notwithstanding this, the relation is a close one, and even David's entry into the Hebrws of north Israel, the weakness of the union being proved by the ease with which it was subsequently broken after Solomon's death. Much of the life of Saul is obscure, and this, too, it would seem, because tradition loved rather to speak of the life of David or of the character of his successful rival (See SAUL.). It is not impossible that some traditions did not bring them together. If Jerusalem and its immediate neighbourhood were first conquered by David (2 Sam. v.), it is probable that Bethel and Gibeah fell to his lot. The two villages, the Jebusite capital, and the home of the family of Saul, which had been a refuge for his father-in-law, were probably taken by Hebron. (Judg. i. 35), Gezer (ib. i. 29), Chephirah and Kirjath-jearim (Jos. ix. 17) had remained Canaanite. The evidence has obviously some bearing upon the history of Saul, as also upon the intercourse between Judah and the Philistines. The chronicler Marquet 2 to conjecture that he was born at Arad (Tell 'Arad).
launderable, and the latest sources of the Pentateuch contain several such lists. This new procedure, we may imagine, was resorted to by the northern Hebrews as an encroachment upon their liberties. We learn that the destroying angel was stayed at the threshing-floor of Araunah the Jebusite, and the spot thus sanctified was made a sanctuary, and commemorated by an altar. It was the very place upon which Solomon's temple was supposed to be founded. The census-taking may have been a preliminary to the great wars, but the latter, on the other hand, are obviously presupposed by the extent of his kingdom. For his wars a larger force than hisearily bodyguard was required, and the Chronicler gives an account of the way in which an army of nearly 300,000 was raised and held by David's thirty heroes (1 Chron. xxvii.). It is certain at all events that no small body of soldiers would be needed, and this alone would imply that all Israel was by this time under his entire control. Apart from the Ammonite war, our sources are confined to a mere summary (vii.), which includes even the Amalekites (viii. 12, cf. 1 Sam. xxx.). After the defeat of the Philistines came the turn of Moab. It was under the care of the king of Moab that David placed his parents when he fled from Saul (1 Sam. xxii. 3 sqq.), and of this expedition and of the war is unmentioned. It is possible that the land was treated with mercy for a gentle reprisal if the Moabites of that day were not more humane than their descendants in the days of King Mesha. A deadly conflict with the Ammonites was provoked by a gross insult to friendly ambassadors of Israel; and this war, of which we have pretty full details in 2 Sam. i. xi.-xi. xii. 26-31, assumed unexpected dimensions when the Ammonites procured the aid of their Aramean neighbours. The defeat of Hadadezer brought about the submission of other lesser kings. The glory of this victory was increased by the complete subjugation of Edom in a war conducted by Joab with characteristic severity (2 Sam. viii. 13; 1 Kings xi. 15-17; Ps. lx. title). The fall of Rabbah concludes David's war-like exploits; he carried off the jewelled crown of their god (Milcom), and subjected the people, not to torture (1 Chron. xx. 3), but to severe menial labour (xii. 26-31).

The Aramean states, Beth-rehob, Maacah, Tob, &c., lay partly to the north of Gilead and partly in the region which was the scene of the fight with Jabin (Josh. xi. 1-9, Judg. iv. 1-9, cf. Deut. xxxii. 29). Apparently it was here, too, that the Danites found a settlement (Judg. xviii. 25); the migration has perhaps been ante-dated. (See DAN, tribe.) The account of David's wars is remarkable for the inclusion of the story of Bathsheba and Absalom. Both the Ammonites and Edom have been suspected (cf. 2 Sam. viii. 5 with x. 16). Some misunderstanding has been caused by the confusion of Edom (zw) and Aram (zw) in vii. 13. A more moderate idea of David's power has been given in v. 12-14, and indeed much of the story relates to the boundaries (2 Sam. xxiv. 5 sqq.). To the east of the Jordan he held rule from Aroer to Gad and Gilead; on its west he passed extended from Beersheba in the south to Dan and Ijon at the foot of the mountains of Moab, Ammon and Edom would appear to have been merely tributary, whilst in the north among his allies David could number the king of Hamath. To the north-west Israel bordered upon Tyre, with whom its relations were friendly. The king of Tyre, who recognized David's newly won position (v. 17 sqq.), is called Hiram of Tyre, unless it be an anticipation of 1 Kings v. His father Abiabael is mentioned. As the birth of Solomon is placed before the capture of Rabbah of Ammon (xii.), it would appear that David's wars were ended within the first half of his reign at Jerusalem, and the tributary nations thus do not seem to have attempted any revolt during his lifetime (see 1 Kings xi. 14 sqq. and 25). It was only when the nation was no longer knit together by the fear of danger from without that the internal difficulties of the new kingdom became more manifest. Such at least is the impression which the narratives convey. So, after David had completed a series of conquests which made Palestine the greatest of the petty states of the age, troubles arose with the Israelites, who in times past had sought for him to be king (iii. 17, v. 1-3), with his old subjects the men of Judah, and with the members of his own household. The northern tribes, who appear to have submitted willingly to his rule, were not all of one mind. There were men of stronger build than the weak Ishshah, and the crippled son of Jonathan, the survivors of Saul's house, and it is only to be expected that David's first care must have been to cement the union of the north and south. The choice of Jerusalem, standing on neutral ground, may be regarded as a stroke of genius, and there is nothing to show that the king exercised that rigour which was to be the cause of his grandson's undoing. (See REHOBOAM.) On the other hand, when Sheba, probably one of Saul's clan, headed a rising and was promptly pursued by Joab to Abel-beth-maacah on the west of Dan, honour was satisfied by the death of the rebel, and no further steps were taken (xx.). This policy of leniency towards Israel appears to have made all well, and we have become a popular theme in the tales of succeeding generations. This humanitarianism towards the survivors of Saul's house has left its mark upon many of the narratives, and helps to a truer understanding of the stories of his early life. Thus it was quite in keeping with the romantic attachment between David and Saul's son Jonathan that when he became king of Israel he took Jonathan's son Meribbaal under his care (ix.). The deed was not merely generous, it was politic to have Saul's grandson under his eyes. The hope of restoring the lost kingdom had not died out (cf. xvi. 3). But from another source we gain quite a different idea of the relations. A disastrous famine ravaged the land for three long years, and when Yahweh was consulted the reply came that there was "blood upon Saul and upon his house because he put the Gibeonites to death." The unavenged blood was the cause of divine anger, and retribution must be made. This David recognized, and, summoning the injured clan, inquired what expiation could be made. Bloodshed could only be atoned by blood-money or by shedding the blood of the offender or of his family. The Gibeonites demanded the latter, and five sons of Meribbaal, the next in the line of Jonathan, were offered as two tithes of Saul's concubine were sacrificed. The awful deed took place at the beginning of harvest (April-May), and the bodies remained suspended until, with the advent of the autumn rains, Yahweh was once more reconciled to his land (xxi. 1-14). The incident is a valuable picture of crude ideas of Yahweh, and, if nothing else were needed, it was sufficient to involve David in a feud with the Benjamites. Here, too, we learn of the tardy burial of the bones of Saul and Jonathan which had remained in Jabesh-Gilead since the battle of Gilboa;—the history of David's dealings with the family of Saul has been obscured. That he took over his harem is only in accordance with the Eastern policy (cf. xii. 8). The harem, an indispensable part of Eastern state, was respon- sible for many fatal disorders, although it is clear from 2 Sam. xvi. 21 that the nation at large was not very sensitive to the enormities which flow from this system. David's deep fall in the matter of Bathsheba (xi.) was too great an iniquity to be passed over lightly, and the base murder of her husband Adonijah (cf. 1 Kings v. 5 sqq.) was followed, as the present position of 2 Sam. ix. xx. shows, by the miscellaneous collection of details in v.-viii. See, on the other hand, the view of 1 Kings v. 3-4.

Absalom's revolt. The present position of this incident, immediately after Absalom's rebellion was quelled, is almost inconceivable (Winckler, H. P. B. Luther, Ed. Meyer). See next page.

v. 1-9. 1 This un-Hebraic name, which is not unlike aron, "ark," should possibly be corrected to Addoniah (Cheyne, Ency. Bibl. s.v.).
2 David destroyed two-thirds of the Moabites—presumably of their men (cf. 2 Kings xv. 4 sqq.), but of the inhabitants of the captured cities in honour of his god Chemosh.
3 It finds a parallel in the fate of the heralds of Orchemonius (Frazer, Pausan. v. 135) and in an Arabic story (Ibn Athir, viii. 360; cf. the allusion of the monk Eulake in Buddle, Hand-Commentator, ad loc.; cf. Bude, i. 152).
4 On the questions raised see the commentaries upon 2 Sam. viii. and x. and the Ency. Biblica, s.v. "David," "Merom," "Zahab." The main problem is whether the account of David's rule has been exaggerated, or whether the attempt has been made to throw back to the time of the first king of all Israel later political conditions.

857

DAVID

The problem is whether the account of David's rule has been exaggerated, or whether the attempt has been made to throw back to the time of the first king of all Israel later political conditions.
David's life-work.

The Appendix ascribes to David a song of triumph and some exceedingly obscure "last words" (xxii.—xxiii.) which cannot be used as historical material. The history of his life is immediately continued in 1 Kings i., where his old age and weakness are for the first time vividly emphasized. The events of the remaining years after 2 Sam. xx. are left untold, but the Chronicler omits the revolt of Absalom and the flight of Ahithophel.

David represents the king as busily occupied with schemes concerning the future temple. The last spark of his old energy was called forth to secure the succession of Solomon against the ambition of Adonijah. It is noteworthy that, as in the case of Absalom, the pretender, though supported by Joab and Abiathar, found his chief stay among the men of Judah (1 Kings i. 9). (See Solomon.)

To estimate the work of David it is necessary to take into account the situation before and after his period. According to the prevailing traditions, Saul at his death had left North Israel disunited and humiliated. From this condition David raised the land to the highest state of prosperity and glory, and by his conquests made the united kingdom the most powerful state of the age. To do this other qualities than mere military capacity were required. David was not only a great captain, he was a national hero in whom all the noblest elements of the Hebrew genius were combined. His talent enabled him to weld together the mixed southern clans which became incorporated under Judah, and to build up a monarchy which represented the highest conception of national life possible under the circumstances. The structure, it is true, was not permanent. Under his successors it began to decay, and in the next generation it fell to pieces. As a result he asunder and lived only in the hearts of the people as the proudest memory of past history and the prophetic ideal of future glory. Opinion will differ, however, as to the extent to which later ideals have influenced the narratives upon which the student of Hebrew history and religion is dependent, and how far the reigns of David and Solomon altered the face of Hebrew history. The foundation of the united monarchy was the greatest advance in the whole course of the history of the Israelites, and around it have been collected the hopes and fears which a varied experience of monarchical government aroused. Many of the narratives furnish a vivid picture of the life of David with a minuteness of personal detail which has suggested to some that their author was intimately acquainted with the events, and, if not a contemporary, belonged to the succeeding generation, while to others it has seemed more probable that these reflect rather "the plastic mould of popular tradition." It cannot be doubted that the three types of David, represented by the books of Samuel, of Chronicles, and the superscriptions of the Psalms, are irreconcilable, and that they represent successive developments of the original traditions. The first class of narratives does not contain earlier attempts to idealize him is unlikely. "Political circumstances naturally led to an ever-increasing appreciation of his person and his work as the unifier of Israel. In the eyes of posterity he became more and more completely the model of an Israelite king and the natural consequence was that he was idealized. The hope of the regeneration of his dynasty, and, at a later period, of its restoration to the throne—the Messianic expectation—must have worked powerfully in the same direction. And meanwhile the religious convictions of the highest minds in Israel were undergoing a marked change. The conceptions of Yahweh and of the religion which was acceptable to him were constantly being elevated and purified. This could not but have an influence on the current ideas concerning David. He, too, must be remodelled as the conceptions of God were changed." But what is lost as regards historical material is a distinct gain to the study of the development of Hebrew thought and philosophy of history.

David's character must be judged partly in the light of the traditions in which he lived and partly in connexion with the great truths which he represents, truths whose value is not impaired should they prove to be the convictions of later ages. Accordingly, David is not to be condemned for failing to subdue the sensuality which is the chief stain on his character, but should rather be judged by his habitual recognition of a generous standard of conduct, by the undoubted purity and lofty justice of an administration which was never stained by selfish considerations or motives of personal rancour, and finally by the calm

—

DAVID

husband Uriah the Hittite could not go unavenged. Bathsheba's influence added a new element of danger to the usual jealousies of the court, and two of David's sons perished in vain attempts to claim the throne, which she appears to have viewed as the rightful inheritance of her own child. This, at least, is certain in the revolt of Adonijah (see Solomon), and it was probably believed that the action of the impulsive Absalom arose from the suspicion that the birth of Solomon was the death-blow to his succession. As a piece of writing the vivid narratives are without an equal. David's sons were estranged from one another, and acquired all the vices of Oriental princes. The severe impartiality of the sacred historian has concealed no feature in this dark picture,—the brutal passion of Amnon, the shameless counsel of the wily Jonadab, the "black scowl"1 that rested on the face of Absalom through two long years of meditated revenge, the panic of the court when the blow was struck and Amnon was assassinated in the midst of his brethren. Not until five years had elapsed was Absalom fully reconciled with his father. Then he meditated revolt. As heir-apparent he collected a bodyguard, and studiously courting personal popularity by a pretended interest in the administration of kingly justice, ingratiated himself with the masses. For a while he even ventured to claim the standard of revolt in Hebron, with the malcontent Judeans as his first supporters, and the crafty Ahithophel as his chief adviser. Arrangements had been made for the simultaneous proclamation of Absalom in all parts of the land. The surprise was complete, and David was compelled to evacuate Jerusalem, where he might have been crushed before he had time to rally his faithful subjects. He was warmly received by the Gileadites, and the first battle destroyed the party of Absalom, who was himself captured and slain by Joab. Then all the people repented except the men of Judah, who were not to be conciliated without a virtual admission of prerogative of kinship to the king. This concession involved important consequences. The precedence claimed by Judah was challenged by the northern tribes even on the day of David's victorious return to his capital, and a rupture ensued, headed by Sheba, which but for the energy of Joab might have led to a second and more dangerous rebellion.

Several indications suggest that the revolt was one in which the men of Judah originally took the leading if not the only part. The unruly clans which David knew how to control when he was at Ziklag or Hebron were doubtless ready to support the rebellious son. The removal of the court to Jerusalem provided a suitable opportunity to reconcile these elements, and David is not represented as desiring such a change. If Geshur be the district in Josh. xiii. 2, 1 Sam. xxvii. 8, it is significant that the scene of Absalom's exile lay to the south, that Ahithophel was a south Judaean, and that Amasa probably belonged to the Jewish Davidites who were connected with the tribe of Judah. The eleven years which elapsed between the murder of Amnon and the revolt would seem to disprove any connexion between the two; the chronology may rest upon the tradition that Solomon was twelve years old when he came to the throne. David's hurried flight, attended only by his bodyguard, indicates that his position was not a very strong one, and it is difficult to connect this with the fact that he had already waged the wars mentioned in 2 Sam. vii. and viii. If his reason for taking refuge in Ishbaal's capital Mahanaim is not obvious, it is an open question whether it was through anxiety for the safety of his children kindly by the Ammonites whom he had previously decimated. On the theory that the revolt of Absalom chronologically should precede the great wars, a slight correction of the already corrupt text in xvii. 27 might be requisite: "David fled with his family and his faithful servants, and the eagerness to repay to Hanun, the son of Nahash, the kindness which he had received from the father (x. 2). That the revolt of Sheba is in an impossible position is obvious. Tradition has probably confused Benjamites with Ishmaelites in this regard, and the parts played by Shimei and Meribaab, at all events, are extremely suggestive. See Absalom, Ahithophel.

David ascribes to a David a song of triumph and some exceedingly obscure "last words" (xxii.—xxiii.) which cannot be used as historical material. The history of his life is immediately continued in 1 Kings i., where his old age and weakness are for the first time vividly emphasized. The events of the remaining years after 2 Sam. xx. are left untold, but the Chronicler omits the revolt of Absalom and the flight of Ahithophel. If Ewald's brilliant interpretation of an obscure word in 2 Sam. xiii. 30 be correct. 1 17 23 1 "Israelite" (2 Sam. xvii. 25) is a very unnecessary designation; i. 17 would make him an Ishmaelite. 2 See Hebr. Religion, Messiah, Prophet. 3 Kuenen, "The Critical Method," Modern Review, 1880, p. 701 (Gesammelte Abhandlungen, Germ., ed. by Budde, p. 33). 4 His charges to Solomon in 1 Kings i. 8-9 do not arise necessarily from motives of revenge; a young and untried sovereign could not
DAVID, ST.—DAVID I.

DAVID, ST. (Dewi, Sant), the national and tutelar saint of Wales, whose annual festival, known as "St David's Day," falls on the 1st of March. Few historical facts are known regarding the saint's life and actions, and the dates both of his birth and death are purely conjectural, although there is reason to suppose he was born about the year 500 and died at a great age towards the close of the 6th century. According to various biographers he was the son of Sandie, a prince of the line of Cunedda, his mother being Non, who ranks as a Cymric saint. He seems to have been a prominent part in the celebrated synod of Llanddewi-Brefi (see CARDIGANSHIRE), and was afterward invited to the so-called "Synod of Victory," held some years later at Caerleon-on-Usk. At some date unknown, St David, as penescil or primate of South Wales, moved the seat of ecclesiastical government from Caerleon to the remote headland of Mynyw, or Menevia, which has ever since, under the name of St David's (Ty-Dewi), remained the cathedral city of the western see. St David founded numerous churches throughout all parts of South Wales, of which fifty-three still recall his name, but apparently he never penetrated farther north than the region of Powys, although he seems to have visited Cornwall. With the passing of time the saint's fame increased, and his shrine at St David's became a notable place of pilgrimage, so that by the time of the Norman conquest his importance and sanctity were fully recognized, and at Henry I.'s request he was formally canonized by Pope Callixtus II. about 1120.

Of the many biographies of St David, the earliest known is that of Rhydmarch, or Ricemarchus (c. 1000), one of the last British bishops of St David's, from whose work Giraldo Cambrensis (d.) chiefly compiled his extravanant life of the saint.

DAVID I. (1084-1153), king of Scotland, the youngest son of Malcolm Canmore. Margaret, sister of Edgar Ætheling, was born in 1084. He married Matilda, daughter and heiress of Waltheof, earl of Northumbria, and thus became possessed of the earldom of Huntingdon. On the death of Edgar, king of Scotland, in 1107, the territories of the Scottish crown were divided in accordance with the terms of his will between his two brothers, Alexander and David. Alexander, together with the crown, received Scotland north of the Forth and Clyde, David the southern district with the title of earl of Cumbria. The death of Alexander I. in 1124 gave David possession of the whole.

In 1127, in the character of an English baron, he swore fealty to Matilda as heiress to her father Henry I., and when the usurper Stephen ousted her in 1135 David vindicated her cause in arms and invaded England. But Stephen marched north with a great army, whereupon David made peace. The peace, however, was not kept. After threatening an invasion in 1137, David marched into England in 1138, but sustained a crushing defeat on Coton Moor in the engagement known as the battle of the Standard. He returned to Carlisle, and soon
afterwards concluded peace. In 1141 he joined Matilda in London and accompanied her to Winchester, but after a narrow escape from capture he returned to Scotland. Henceforth he remained in his own kingdom and devoted himself to its political and ecclesiastical reorganization. A devoted son of the church, he founded five bishoprics and many monasteries. In secular politics he energetically forwarded the process of feudalization which had been initiated by his immediate predecessors. He died at Carlisle on the 24th of May 1153.

DAVID II. (1324–1371), king of Scotland, son of King Robert the Bruce by his second wife, Elizabeth de Burgh (d. 1327), was born at Dunfermline on the 5th of March 1324. In accordance with the terms of the treaty of Northampton he was married in July 1328 to Joanna (d. 1362), daughter of the English king, Edward II., and became king of Scotland on his father's death in June 1329, being crowned at Scone in November 1331. Owing to the victory of Edward III. of England and his protege, Edward Baliol, at Halidon Hill in July 1333, David and his queen were sent for safety into France, reaching Boulouge in May 1334, and being received very graciously by the French king, Philip VI. Little is known about the life of the Scottish king in France, except that Château Gaillard was given to him for a residence, and that he was entertained at the court of the English and French armies at Vironfosse in October 1339. Meanwhile his representatives had obtained the upper hand in Scotland, and David was thus enabled to return to his kingdom in June 1341, when he took the reins of government into his own hands. In 1346 he invaded England in the interests of France, but was defeated and taken prisoner at the battle of Neville's Cross in October of this year, and remained in England for eleven years, living principally in London and at Odiham in Hampshire. His imprisonment was not a rigorous one, and negotiations for his release were soon begun. Eventually, in October 1357, after several interruptions, a treaty was signed at Berwick by which the Scottish estates undertook to pay 100,000 marks as a ransom for their king. David, who had probably recognized Edward III. as his feudal superior, returned at once to Scotland; but owing to the poverty of the kingdom it was found impossible to raise the ransom. A few instalments were paid, but the king sought to get rid of the liability by offering to make Edward III., or one of his sons, his successor in Scotland. In 1354, the Scottish parliament actually rejected a proposal to make Lionel, duke of Clarence, the next king; but David treated secretly with Edward III. over this matter, after he had suppressed a rising of some of his unruly nobles. The king died in Edinburgh Castle on the 22nd of February 1371. His second wife was Margaret, widow of Sir John Logie, whom he divorced in 1360; but he left no children, and was succeeded by his nephew, Robert II. David was a weak and incapable ruler, without a spark of his father's patriotic spirit.

at Saint-Germain-en-Laye on the 29th of August 1876. If David could scarcely be placed in the first rank of French composers, he nevertheless deserves the consideration due to a sincere artist, who was undoubtedly inspired by lofty ideals. At a time when the works of Berlioz were still unappreciated by the majority of people, David succeeded in making the public take interest in music of a picturesque and descriptive kind. Thus he may be considered as one of the pioneers of modern French musical art.

DAVID, GERARD—DAVID, J. L.

GERARD—DAVID, born at Oudewater in Holland between 1450 and 1460, was the last great master of the Bruges school. He was only rescued from complete oblivion in 1860-1863 by Mr W. J. H. Weale, whose researches in the archives of Bruges brought to light the main facts of the master's life. We have now documentary evidence that David came to Bruges in 1483, presumably from Haarlem, where he had formed his early style under the tuition of Ouwater; that he joined the gild of St Luke at Bruges in 1484 and became dean of the gild in 1501; that he married in 1496 Cornelia Snoo, daughter of the dean of the Golden Wolf gild; became one of the leading citizens of the town; died on the 21st of August 1523; and was buried in the Church of Our Lady at Bruges. In his early work he had followed the Haarlem tradition as represented by Dirck Bouts, Ouwater and Geertgen of Haarlem, but already gave evidence of his superior power as colourist. To this early period belong the "St John" of the Kaufmann collection in Berlin, and Mr Salting's "St Jerome." In Bruges he applied himself to the study and the copying of the masterpieces by the Van Eycks, Van der Weyden, and Van der Goes, and came under the direct influence of the master whom he followed most closely, Hans Memlinc. From him he acquired the soulful intensity of expression, the increased realism in the rendering of the human form and the orderly architectonic arrangement of the figures. Yet another master was to influence him later in life when, in 1515, he visited Antwerp and became impressed by the life and movement of Quentin Matsys, who had produced a more intimate and foreman conception of sacred themes. David's "Pietà," in the National Gallery, and the "Descent from the Cross," in the Cavalo collection, Paris (Guildhall, 1906), were painted under this influence and are remarkable for their dramatic movement. But the works on which David's fame will ever rest most securely are the great altar-pieces executed by him before his visit to Antwerp—the "Marriage of St Catherine," at the National Gallery; the triptych of the "Madonna Enthroned and Saints" of the Brignon-Salem collection in Genoa; the "Annunciation" of the Sigmaringen collection; and, above all, the "Madonna with Angels and Saints," which he painted gratuitously for the Carmelite Nuns of Sion at Bruges, and which is now in the Rouen museum. Only a few of his works have remained in Bruges—"The Judgment of Cambyses," "The Playing of Sisamas" and the "Baptism of Christ" in the Town museum, and the "Transfiguration" in the Church of Our Lady. Others were scattered all over the world, and to this may be due the oblivion into which his very name had fallen—partly to this, and partly to the fact that with all the beauty and soulfulness of his work he had no new page to add to the history of the progressive development of art, and even in his best work only gave new variations of the tunes sung by his great predecessors and contemporaries.

That he is worthy to rank among the masters was only revealed to the world when a considerable number of his paintings were assembled at Bruges on the occasion of the exhibiton of early Flemish masters in 1902. At the time of his death the glory of Bruges, and also of the Bruges school, was on the wane, and Antwerp had taken the leadership in art as in political and commercial importance. Of David's pupils in Bruges, only Isenbrandt, A. Cornelis and Ambrosius Benson achieved importance. Among other Flemish painters Joachim Patinir and Melcouse were to some degree influenced by him.

Eberhard Freiherr von Bodenhäuser published in 1905 a very comprehensive monograph on Gerard David and his School (Munich, F. Bruckmann), together with a catalogue raisonné of his works, which, after careful sifting, are reduced to the number of forty-three.
DAVID, P. J.—DAVIDSON, A. B.

returned to classical subjects: "Amor quittant Psyche," "Mars disarmed by Venus," &c. He rejected the offer, made through Baron Humboldt, of the office of minister of fine arts at Berlin, and remained at Brussels till his death on the 20th of December 1825. His end was true to his whole character and to his nationality. While lying, a print of the Leonidas, one of his favourite subjects, was submitted to him. After vaguely looking at it a long time, "Il n'y a que moi qui puisse concevoir la tête de Leonidas," he whispered, and died. His friends and his party thought to carry the body back to his beloved Paris for burial, but the government of the day arrested the procession at the frontier, an act which caused some scandal, and furnished the occasion of a terrible song of Bréanger's.

It is difficult for a generation which has witnessed another complete revolution in the standards of artistic taste to realize the secret of David's immense popularity in his own day. His style is severely academic, his colour lacking in richness and warmth, his execution hard and uninteresting in its very perfection. Subjects and treatment alike are inspired by the passing fashion of an age which had deceived itself into believing that it was living and moving in the spirit of classical antiquity. The inevitable reaction of the romantic movement made the masterpieces, which had filled the men of the hour with enthusiasm, seem cold and lifeless to those who had been taught to expect in art something of mystery which in nature was every present. Yet David was a great artist, and exercised in his day and generation a great influence. His pictures are magnificent in their composition and their draughtsman's; and his keen observation and insight into character are evident, especially in his portraits, notably of Madame Récamier, of the Conventional Gérard and of Boissy d'Anglas.

DAVID, PIERRE JEAN (1788–1856), usually called David d'Angers, French sculptor, was born at Angers on the 12th of March 1789. His father was a sculptor, or rather a carver, but he had thrown aside the mallet and taken the musket, fighting against the Chouans of La Vendée. He returned to his trade at the end of the civil war, to find his customers gone, so that young David was born into poverty. As the boy grew up his father wished to force him into some more lucrative and certain way of life. At last he succeeded in surmounting the opposition to his becoming a sculptor, and in his eighteenth year left for Paris to study the art of carving in a capital of eleven francs. After struggling for a year and a half, he succeeded in taking the prize at the École des Beaux-Arts. An annuity of 600 francs (£24) was granted by the municipality of his native town in 1809, and in 1811 David's "Épaminondas" gained the prix de Rome. He spent five years in Rome, during which his enthusiasm for the works of Canova was often excessive.

Returning from Rome about the time of the restoration of the Bourbons, he would not remain in the neighbourhood of the Tuileries, which swarmed with foreign conquerors and returned royalists, and accordingly went to London. Here Flaxman and others visited upon him the sins of David the painter, to whom he was erroneously supposed to be related. With great difficulty he made his way to Paris again, where a comparatively prosperous career opened upon him. His medallions and busts were in much request, and orders for monumental works also came to him. One of the best of these was that of Gutenberg at Strauburg; but those he himself valued most were the statue of Barra, a drummer boy who continued to beat the drum till the moment of death in the war in La Vendée, and the monument to the Greek liberator Broussias. For representing in a young female figure called "Recovering Greece," of which Victor Hugo said: "It is difficult to see anything more beautiful in the world; this statue joins the grandeur of Pheidias to the expressive manner of Puget." David's busts and medallions were very numerous, and among his sitters may be found not only the illustrious men and women of France, but many others both of England and Germany—countries which he visited professionally in 1827 and 1829. His medallions, it is affirmed, number 500. He died on the 4th of January 1856. David's fame rests firmly on his pediment of the Pantheon, his monument to General Gobert in Père Lachaise and his marble "Philosophen" in the Louvre. In the Musée David at Angers is an almost complete collection of his works either in the form of copies or in the original moulds. As an example of his benevolence of character may be mentioned his rushing off to the sick-bed of Rouget de Lisle, the author of the "Marseillaise Hymn," modelling and carving him in marble without delay, making a lottery of the work, and sending to the poet in the extremity of need the seventy-two pounds which resulted from the sale.

See H. Jouv, David d'Angers et ses relations littéraires (1890); Lettres de P. J. David d'Angers à Louis Dupré (Paris, 1891); Collection de portraits des contemporains d'après les médallions de P. J. David (Paris, 1898).

DAVIDISTS, a fancy name rather than a recognized designation for three religious sects. It has been applied (1) to the followers (if he had any) of David of Dinant, in Belgium, the teacher or pupil of Amalic (Amaury) of Bena, both of whom taught apparently a species of pantheism. David's Quaerenti, or Quaerentii, condemned and burnt at Paris (1309), is a lost book, known only by references in the works of Magnus and Thomas Aquinas. It is quite possible it had been burnt had he not died. The name has been given (2) to the followers of David George or Joris (q.v.), and (3) to the followers of Francis David (1510–1579), the apostle of Transylvanian unitarianism. (See SOCINUS, UNITARIANISM.)

DAVIDSON, ANDREW BRUCE (1831–1902), Scottish divine, was born in 1831 at Kirkhill in Aberdeenshire, where his father Andrew Davidson had a farm. The Davidsons belonged to the congregation of James Robertson (1803–1861) of Ellon, one of the ministers of Strathbogie Presbytery, who in the controversy which led to the disruption, resisted the "dangerous claims of the established church to self-government." When the disruption came the principles at stake were keenly canvassed in Ellon, and eventually Andrew Davidson, senior, went with the Free Church. In 1845 the boy, who had been a "herd" on the farm, went for six months to the grammar school at Aberdeen and was there prepared for a university bursary, which was sufficient to pay his fees, but no more. During his four years at the university his mother supplied him fortuitously with provisions from the farm; sometimes she shot poultry miles from Kirkhill and handed the coach fee to her son. He graduated in 1849. At the university he had acquired a distrust of philosophy, and found it difficult to choose between mathematical and linguistic studies. A Free Church school having been opened in Ellon, he became master there for three years. Here he developed special aptitude for linguistic and philological studies. Besides Hebrew he taught himself French, German, Dutch, Italian and Spanish. In November 1852 he entered New College, Edinburgh. There he took the four years' theological course, and was licensed in 1856. For two years he preached occasionally and took vacancies. In 1858 the New College authorities appointed him assistant to the professor of Hebrew. He taught during the winter, and in the long vacation continued his preparation for his life work. One year he worked in Germany under Ewald, another year he went to Syria to study Arabic. In 1862 he published the first part of a commentary on Job. It was never finished and deals only with one-third of the book, but it is recognized as the first really scientific commentary on the Old Testament in the English language. In 1869 he was appointed by the general assembly of oriental languages at New College. He was junior colleague of Dr John Duncan (Rabbi Duncan) till 1870, and then for thirty years sole professor. He was a member of the Old Testament revision committee, and his work was recognized by several honorary distinctions, LL.D. (Aberdeen), D.D. (Edinburgh), Litt.D. (Cambridge). Among his students were Professors Elmslie, Skinner, Harper of Melbourne, Walker of Belfast, George Adam Smith of Glasgow and W. Robertson Smith. He understood it to be the first duty of an exegete to ascertain the meaning of the writer, and he showed that this could be done by the use of grammar and history and the historical imagination. He supplied guidance when it was much
needed as to the methods and results of the higher criticism. Being a master of its methods, but very cautious in accepting assertions about its results, he secured attention early in the Free Church for scientific criticism. And yet threw the whole weight of his learning and his caustic wit into the argument against critical extravagance. He had thought himself into the ideas and points of view of the Hebrews, and his work in Old Testament theology is unrivalled. He excels as an expositor of the governing Hebrew ideas such as holiness, righteousness, Spirit of God, Messiahism. In 1897 he was chosen moderator of the general assembly, but his health prevented his accepting the post. He died, unmarried, on the 26th of January 1902.

Besides the commentary on Job he published a book on the Hebrew Accents, the only Scottish performance of the kind since the days of Flesher. His Introduction to Hebrew Grammar has been widely adopted as a class-book in theological colleges. His Hebrew Syntax has the same admirable clearness, precision and teaching quality. His Commentary on the Epistle to the Hebrews is one of a series of handbooks for Bible classes. These were followed by commentaries on Job, Ezekiel, Nahum, Habakkuk and Zephaniah, in the Cambridge series; and a Bible-class primer on The Exile and Restoration. His lectures on Old Testament Prophecy were published after his death by Dr. J. A. M'Pherson. The Theology of the Old Testament in the "International Theological Library," is a handsome volume edited by Professor Salmon. "Isaiah" in the Temple Bible was finished, but not revised, when he died; and he also had in hand the volume on Isaiah for the International Critical Commentary, to which must be added a class of articles contributed to The Imperial Bible Dictionary, The Encyclopaedia Britannica, and the chief religious reviews. Various articles in Dr. Hastings' Bible Dictionary were by Davidson, especially the article "God." Two of his sermons, The Call of Job and Waiting upon God, were published from MS. after Davidson's death.

DAVIDSON, JOHN (1857-1909), British poet, playwright and novelist, son of the Rev. Alexander Davidson, a minister of the Evangelical Union, was born at Barrhead, Renfrewshire, Scotland, on the 11th of April 1857. After a schooling at the Highlanders' Academy, Greenock, at the age of thirteen he was set to work in that town, by helping in a sugar factory laboratory and then in the town analyst's office; and at fifteen he went back to his old school as a pupil-teacher. In 1876 he studied for a session at Edinburgh University, and then went as a master to various Scotch schools till 1890, varying his experiences in 1884 by being a clerk in a Glasgow thread firm. He had married in 1885, and meanwhile his hobby was the writing of plays. The introduction of the public success, in the publication of his poetical and fantastic plays, Bruce (1886), Smith; a tragic farce (1888) and Scaramouche in Naxos (1889). Determining at all costs to follow his literary vocation, he went to London in 1890, but at first had a hard struggle. There his prose-romance Perfervid (1890) was published, one of the most original and fascinating stories of "young blood" and child adventure ever written, but for some reason it did not catch the public; and a sort of sequel in The Great Men (1891) met no better fate. He contributed, however, to newspapers and became known among literary journalists, and his volume of verse In a Music-Hall (1891) prepared the way for the genuine success two years later of his Fleet Street Elogues (1893), which sounded a new and vigorous note, and once established his position among the younger generation of poets. He subsequently produced several more books in prose, romantic stories like Baptist Lake (1894) and Earl Lavender (1895), and an admirable piece of descriptive landscape writing in A Random Itinerary (1894); but his acceptance as a poet gave him a more emphatic impulse to his work in verse, and made his plays an act of of giving away his powers shown in his Ballads and Songs (1894), Second Series of Fleet Street Elogues (1895), New Ballads (1896), The Last Ballad, &c. (1898), all full of remarkably fresh and unconventional beauty.

In spite of the strangely neglected genius of this early Perfervid, it is accordingly as a writer of verse rather than of prose-fiction that he occupies a leading place, with a decided character of his own, in recent English literature, his revival of a modernized ballad form being a considerable achievement in itself, and his poems being packed with fine thought, robust and masterful in expression and imagery. Meanwhile in 1896 he produced an English verse adaptation, In For the Crown (acted by Forbes Robertson and Mrs Patrick Campbell), of François Coppée's drama Pour la Couronne which had considerable success and was revived in 1902, and he wrote several other lyrics, remarkable none the less for dramatic qualities,—Godfrey's (1895), Self's the Man (1901), The Knight of the Maypole (1902) and The Theatrocrat (1903), in the last of which a tendency to be extraordinary is rather too manifest. This tendency was not absent from his volume of Holiday and Other Poems (1906), containing many fine things, together with an "essay on blank verse," illustrated from his own compositions, the outspoken criticisms of a writer of admitted originality and insight, but not devoid of eccentric volubility. But if the identification of "eccentricity" and "greatness" by Cosmo Mortimer in Mr Davidson's own Perfervid sometimes obtrudes itself on the memory in considering his more peculiarly "robust" and somewhat volcanic deliverances, no such objection can detract from the genuine inspiration of his best work, in which the true poetic afflatus is unmistakable. This is to be found in his poems published from 1893 to 1898, five years during which his reputation steadily and deservedly grew,—the Fleet Street Elogues, with their passionate modern criticism of life combined with their breath of rural beauty, and such intense ballads as Of a Nun," and "Of Heaven and Glory." In his old age he wrote his Testament of a Visidder and The Testament of a Man Forbid (1905), The Testament of an Empire Builder (1902), Mammon and his Message (1908), &c., the fine quality of the verse is wedded with a certain fervid satirical journalism of subject, less admirable than the detachment of thought in the earlier volumes. In later years he lived at Penzance, provided with a small Civil List pension, but otherwise badly off, for his writings brought in very little money. On March 23rd, 1909, he disappeared, in circumstances pointing to suicide, and six months later his body was found in the sea.

DAVIDSON, RANDALL THOMAS (1848- ), archbishop of Canterbury, son of Henry Davidson, of Muirhouse, Edinburgh, was born in Edinburgh and educated at Harrow and Trinity College, Oxford. He took orders in 1874 and held a curacy at Dartford, in Kent, till 1877, when he became resident chaplain and private secretary to Dr Tait, archbishop of Canterbury, a position which he occupied till Dr Tait's death, and retained for a short time (1882-3) after his own elevation to the See. He married in 1878 Edith, the second daughter of Archbishop Tait, whose Life he eventually wrote (1891). In 1882 he became honorary chaplain and sub-almoner to Queen Victoria, and in the following year was appointed dean of Windsor, and domestic chaplain to the queen. His advice upon state matters was constantly sought by the queen and greatly valued. From 1891 to 1903 he was clerk of the closet, first to Queen Victoria and afterwards to King Edward VII. He was made bishop of Rochester in 1891, and was translated to Winchester in 1895. In 1903 he succeeded Temple as archbishop of Canterbury. The new archbishop, without being one of the English divines who have made notable contributions to theological learning, already had a great reputation for ecclesiastical statesmanship; and in subsequent years his diplomatic abilities found ample scope in dealing not only with the difficulties caused in the church by doctrinal questions, but pre-eminently with the education crisis, and with the new problems arising in the enlarged Anglican Communion. As the chief representative of the Church of England in the House of Lords, his firmness, combined with broadmindedness, in regard to the problem of amalgamation towards denominal education, made his influence widely felt. In 1904 he visited Canada and the United States, and was present at the triennial general convention of the Protestant Episcopal Church of the United States and Canada. In 1908 he presided at the Pan-Anglican congress held in London, and at the Lambeth conference which followed. He had edited in 1889 The Lambeth Conferences, an historical account of the conferences of 1867, 1878 and 1888, giving the official reports and resolutions, and the sermons preached on these occasions.
DAVIDSON, SAMUEL (1807–1868), Irish biblical scholar, was born near Ballymena in Ireland. He was educated at the Royal College of Belfast, entered the Presbyterian ministry in 1835, and was appointed professor of biblical criticism at his own college. Becoming a Congregationalist, he accepted in 1842 the chair of biblical criticism, literature and oriental languages at the Lancashire Independent College at Manchester; but he was obliged to resign in 1857, being brought into collision with the college authorities by the publication of an introduction to the Old Testament entitled The Text of the Old Testament, and the Interpretation of the Bible, written for a new edition of Horne’s Introduction to the Sacred Scripture. Its liberal tendencies caused him to be accused of unsound views, and a most exhaustive report prepared by the Lancashire College committee was followed by numerous pamphlets for and against. After his resignation a fund of £3000 was subscribed as a testimonial by his friends.

In 1862 he removed to London to become scripture examiner in London University, and he spent the rest of his life in literary work. He died on the 1st of April 1868. Davidson was a member of the Old Testament Revision Committee. Among his principal works are:—Sacred Hermeneutics Developed and Applied (1843), rewritten and republished as A Treatise on Biblical Criticism (1852), Lectures on Ecclesiastical Polity (1849), An Introduction to the New Testament (1854–1855), The Hebrew Text of the New Testament (1853), The Text of the Old Testament (1862), On a Fresh Revision of the Old Testament (1873), The Canon of the Bible (1877), The Doctrine of Last Things in the New Testament (1883), besides translations of the New Testament from Von Tischendorf’s text, Giseler’s Ecclesiastical History (1846) and Fürst’s Hebrew and Chaldee Lexicon.

DAVIDSON, THOMAS (1817–1885), British palaeontologist, was born in Edinburgh on the 17th of May 1817. His parents possessed considerable landed property in Midlothian. Educated partly at the university at Edinburgh and partly in France, Italy and Switzerland, and early acquiring an interest in natural history, he benefited greatly by acquaintance with foreign languages and literature, and with men of science in different countries. He was induced in 1837, through the influence of Leopold von Buch, to devote his special attention to the brachiopoda, and in course of time he became the highest authority on this group. The great task of his life was the Monograph of British Fossil Brachiopoda, published by the Palaeontographical Society (1859–1886). This work, with supplements, comprises six quarto volumes with more than 200 plates drawn on stone by the author. He also published an exhaustive memoir on “Recent Brachiopoda,” published by the British Association in 1857. He was elected F.R.S. in 1857. He was awarded in 1865 the Wollaston medal by the Geological Society of London, and in 1870 a royal medal by the Royal Society; and in 1882 the degree of L.L.D. was conferred upon him by the university of St Andrews.

He died at Brighton on the 14th of October 1885, bequeathing his fine collection of recent and fossil brachiopoda to the British Museum.

See biography with portrait and list of papers in Geol. Mag. for 1871, p. 145.

DAVIES, DAVID CHARLES (1826–1891), Welsh nonconformist divine, was born at Aberystwyth on the 11th of May 1826, his father being a merchant and a pioneer of Welsh Methodism, his mother a niece of Thomas Charles (q.v.) of Bala. He was educated in his native town by a noted schoolmaster, John Evans, at Bala College, and at University College, London, where he graduated B.A. in 1847 and M.A. (in mathematics) in 1849. He had already begun to preach, and after an evangelistic tour in South Wales supplied the pulpit of the English presbyterian church at Newtown for six months, and settled as pastor of the bilingual church at Builth in 1851. He returned to this charge after a pastorate at Liverpool (1853–1856), left it again in 1858 for Newtown, and went in May 1859 to the Welsh church at Jiewen Crescent, London. Here he remained until 1856, and from that date till 1882, although living at Bangor for reasons of health, had the chief oversight of the church. In 1888 he accepted the principalship of the Calvinistic Methodist College at Tregwcc in Brecknockshire. His work here was successful, but short; he died at Bangor on the 26th of September 1891, and was buried at Aberystwyth.

Though Davies stood somewhat apart from the main currents of thought both without and within his church, and was largely unknown to English audiences, his readers, he exercised a strong influence on Welsh life and thought in the 19th century. He was a serious student, especially of anti-theistic positions, a good speaker, and a frequent contributor to Welsh theological journals. Several of his works have been collected and published, the most noteworthy being expositions on The First Epistle of John (1880), Ephesians (2 vols., 1896, 1901), Psalms (1897), Romans (1902); and The Atonement and Intercession of Christ (1890), English trans. by D. E. Jenkins, 1901.

DAVIES, SIR JOHN (1569–1626), English philosophical poet, was baptized on the 16th of April 1569, at Tisbury, Wiltshire, where his parents lived at the manor-house of Chicksorge. He was educated at Winchester College, and became a commoneer of Queen’s College, Oxford, in 1585. In 1588 he entered the Middle Temple, and was called to the bar in 1591. In his general onslaught on literature in 1599 the archbishop of Canterbury ordered to be burnt the notorious and now excessively rare volume, All Ood’s Elegies, 3 Bookes, by C. M. Epigrams by J. D. (Middleburgh, 1598 ?), which contained posthumous work by Marlowe. The epigrams by Davies, although not devoid of wit, do not possess the genuine force and depth that. It is probable that they were earlier in date of composition than the charming fragment entitled Orchestra (1596), written in the spring of 1596.

The poet, in the person of Antinofis, tries to induce Penelope to dance by arguing that all harmonious natural processes partake of the nature of a conscious and well-ordered dance. He closes his argument by foreshadowing in a magic mirror the revels of the court of Cynthia (Elizabeth). Orchestra was dedicated to the author’s “very friend, Master Richard Martin,” but in the next year the friends quarrelled, and Davies was expelled from the society for having struck Martin with a cudgel in the hall of the Middle Temple. He spent the year after his expulsion at Oxford in the composition of his philosophical poem on the nature of the soul and its immortality—Nosce teipsum (1599). The style of the work was entirely novel; and the stanza in which it was written—the decasyllabic quatrain with alternate rhymes—had never been so effectively handled. Its force, eloquence and ingenuity, the orderly and lucid arrangement of its matter, place it among the finest of English didactic poems. In 1599 he also published a volume of twenty-six graceful acrostics on the words Elisabeth Regina, entitled Hymns to Astraera. He produced no other works of this kind, except the contributions to Francis Davison’s Poetical Rhapsody (1608). These were then written as entertainments for the queen, and “Yet other Twelve Wonders of the World,” satirical epigrams on the courtier, the divine, the maid, &c, and “A Hymn in praise of Music.”

Ten sonnets to Philemon are signed J. D., and are assigned to Davies (Poetical Rhapsody, ed. A. H. Bullen, 1890). In 1601 Davies was restored to his position at the bar, after making his apologies to Martin, and in the same year he sat for Corfe Castle in parliament. James I. received the author of Nosce teipsum with great favour, and sent him (1603) to Ireland as solicitor-general, conferring the honour of knighthood upon him in the same year. In 1606 he was promoted to be attorney-general for Ireland, and created serjeant-at-arms. Of the difficulties in the way of the prosecution of his work, and his untiring industry in overcoming them, there is abundant evidence in his letters to Cecili preserved in the State Papers on Ireland. One of his chief aims was to establish the Protestant religion firmly in Ireland, and he took strict measures to enforce the law for attendance at church. With the same end in view he took an active part in the “plantation” of Ulster. In 1612 he published his prose Discoverie of the true causes why Ireland was never etc., which was produced until the beginning of his Majestie’s happy reign.1 The same year he entered the Irish parliament as member for Fermanagh, and was elected speaker after a scene of disorder in which the

1 Edited by Henry Morley in his Ireland under Elizabeth and James I. (1890).
Catholic nominee, Sir John Everard, who had been installed, was forcibly ejected. In the capacity of speaker he delivered an excellent address reviewing previous Irish parliaments. He resigned his Irish offices in 1616, and sat in the English parliament of 1621 for Newcastle-under-Lyme. With Sir Robert Cotton he was one of the founders of the Society of Antiquaries. He was appointed lord chief justice in 1626, but died suddenly (December 8th) before he could enter on the office. He had married (1609) Eleanor Touchet, daughter of George, Baron Audley. She developed eccentricity, verging on madness, and wrote several fanatical books on prophecy.

In 1615 Davies published at Dublin Le Primier Discours des Causes et MATTERS in LEY RESOLUS et ADJUDGES en LES COUTS de REY en CEST Realme (reprinted 1628). He issued an edition of his poems in 1635. His writings were mainly miscellaneous, and the Question concerning Impessions, Tonnage, Poundage, was printed in 1656, and four of the tracts relating to Ireland, with an account of Davies and his services to that country, were edited by G. Calmeres in 1786. His works were edited by Dr A. B. Grosart (3 vols., 1869-1876), with a full biography, for the Fuller Worthies Library.

He is not to be confounded with another poet, JOHN DAVIES of Hereford (1565-1618), among whose numerous volumes of verse may be mentioned Mirum in modum (1602), Microcosmata (1663), The Holy Roode (1606), Wiltos Pilgrimage (c. 1610), The Scourge of Folly (c. 1611), The Muses Sacrifice (1612) and Wittes Bedlam (1607); his Scourge of Folly contains verses addressed to many of his contemporaries, and at the same time is also a scurrilous Second Husband for Sir Thomas Overbury's Wife (1616), and The Writing Schoolmaster (earliest known edition, 1633); his works were collected by Dr A. B. Grosart (2 vols., 1873) for the Chertsey Worthies Library.

DAVIES (Davistus), JOHN (1759-1732), English classical scholar and critic, was born in London on the 22nd of April 1759. He was educated at Charterhouse and Queens' College, Cambridge, of which society he was elected fellow (July 7th, 1781). He subsequently became rector of Fen Ditton, prebendary of Ely, and president of his college. He died on the 7th of March 1731-1732, and was buried in the college chapel. Davies was considered one of the best commentators on Cicero, his attention being chiefly devoted to the philosophical works of that author. Amongst these he edited the Tusculanae disputationes (1709), De natura daemonum (1718), De divinatione and De fato (1725), Academica (1725), De legibus (1727), De finibus (1728). His nearly finished notes on the De officiis he bequeathed to Dr Richard Mead, with a view to their publication. Mead, finding himself unable to carry out the undertaking, transferred the notes to Thomas Bentley (nephew of the famous Richard Bentley), by whose carelessness they were burnt. Davies's editions, which were intended to supplement those of Graevius, show great learning and an extensive knowledge of the history and systems of philosophy, but he allows himself too much latitude in the matter of emendation. He also edited Maximus of Tyre's Dissertationes (1709); the works of Caesar (1706); the Octavist of Minucius Felix (1707); the Epipolae divinarum institutionum of Lactantius (1718). Although on intimate terms with Richard Bentley, he found himself unable to agree with the great scholar in regard to his dispute with Trinity College.

DAVIES, SIR LOUIS HENRY (1845- ), Canadian politician and jurist, was born in Prince Edward Island in 1845, of Huguenot descent. From 1869 to 1879 he took part in local politics, and was premier from 1876-1879; in 1882 he entered the Canadian parliament as a Liberal, and from 1896 to 1901 was minister of marine and fisheries. In the latter year he became one of the judges of the supreme court of Canada. In 1877 he was counsel for Great Britain before the Anglo-American fisheries commission held at Halifax; in 1899 he was a joint delegate to Washington with Sir Wilfrid Laurier on the Bering seal question; and in 1898-1899 a member of the Anglo-American joint high commission at Quebec.

DAVIES, RICHARD (c. 1505-1581), Welsh bishop and scholar, was born in North Wales, and was educated at New Inn Hall, Oxford, becoming vicar of Burnham, Buckinghamshire, in 1550. Being a reformer he took refuge at Geneva during the reign of Mary, returning to England and to parochial work after the accession of Elizabeth in 1558. His connexion with Wales was renewed almost at once; for, after serving on a commission which visited the Welsh dioceses, he was, in January 1560, consecrated bishop of St Asaph, whence he was translated, early in 1561, to the bishopric of St Davids. As a bishop Davies was an earnest reformer, very industrious, active and liberal, but not very scrupulous with regard to the property of the church. He was a member of the council of Wales, was very friendly with Matthew Parker, archbishop of Canterbury, and was regarded both by Parker and by William Cecil, Lord Burghley, as a trustworthy adviser on Welsh concerns. Another of the bishop's friends was Walter Devereux, first earl of Essex. Assisting William Salisbury, Davies took part in translating the New Testament into Welsh, and also did some work on the Welsh translation of the Book of Common Prayer. He helped to revise the "Bishops' Bible" of 1568, being himself responsible for the book of Deuteronomy, and the second book of Samuel. He died on the 29th of November 1581, and was buried in Abergavenny Church.

DAVILA, ENRICO CATERINO (1556-1632), Italian historian, was descended from a Spanish noble family. His immediate ancestors had been constables of the kingdom of Cyprus for the Venetian republic since 1464. But in 1579 the island was taken by the Turks; and Antonio Davila, the father of the historian, had to leave it, despoiled of all he possessed. He travelled into Spain and France, and finally returned to Padua, and at Sacco on the 30th of October 1576 his youngest son, Enrico Caterino, was born. About 1583 Antonio took this son to France, where he became a page in the service of Catherine de' Medici, wife of King Henry II. In due time he entered the military service, and fought through the civil wars until the peace in 1598. He then returned to Padua, where, and subsequently at Parma, he led a studious life until, when war broke out, he entered the service of the republic of Venice and served with distinction in the field. But during the whole of this active life, many details of which are very interesting as illustrative of the life and manners of the time, he never lost sight of a design which he had formed at a very early period, of writing the history of those civil wars in France in which he had borne a part, and during which he had had so many opportunities of closely observing the leading personages and events. This work was completed about 1630, and was offered in vain by the author to all the publishers in Venice. At last one Tommaso Baglioni, who had no work for his presses, undertook to print the manuscript, on condition that he should be free to leave off if more promising work offered itself. The printing of the Istoria delle guerre civili di Francia was, however, completed, and the success and sale of the work were immediate and enormous. Over two hundred copies followed, of which perhaps the best is the one published in Paris in 1644. Davila was murdered, while on his way to take possession of the government of Cremona for Venice in July 1631, by a ruffian, with whom the dispute seems to have arisen concerning the furnishing of the relays of horses ordered for his use by the Venetian government. The Istoria was translated into French by G. Baudouin (Paris, 1642); into Spanish by Varen de Soto (Madrid, 1641, and Antwerp, 1666); into English by W. Aylesbury (London, 1647), and by Charles Cruikshank (London, 1669). The work was also translated into Italian by Antonio Cornazzano (Rome, 1745). The best account of the life of Davila is that by Apostolo Zeno, prefixed to an edition of the history printed at Venice in 2 vols. in 1753. Peter Bayle is severe on certain historical inaccuracies, and claims that it must be read with due remembrance of the fact that he was not only a Catholic but the especial protege of Catherine de' Medici, but it is not to be forgotten that Bayle was as strongly Protestant.

DAVIS, ANDREW JACKSON (1826-1910), American spiritualist, was born at Blooming Grove, Orange county, New York, on the 20th of January 1826. He is certainly one of the most extraordinary men of the age, though probably much more than he and his friends pretended. In 1843 he heard lectures in Poughkeepsie on "animal magnetism," as the phenomena of hypnotism was then termed, and found that he had remarkable clairvoyant powers; and in the following year he said, spiritual messages telling him of his life work. For the next three years (1843-1847) he practised magnetic healing with much success; and in 1847 he published The Principles of Nature, Her Divine Revelations, and a Voice to
Mankind, which in 1845 he had dictated while in a trance to his "scribe," William Fishbaugh. He lectured with little success and returned to writing (or "dictating") books, publishing about thirty in all, including The Great Harmonic (1850-1861), an "encyclopedia" in six volumes; The Philosophy of Special Providences (1850), which with its evident reheas of old arguments against special providences and miracles would seem to show that Davis's inspiration was literary; The Magic Staff: an Autobiography (1857), which was supplemented by Arbala; or the Divine Guest, Containing a New Collection of New Gospels (1867), the gospels being those "according to" St. Conffucius, St John (G. Whitliff), St Gabriel (Derzhavin), St Octavius (Frithongham), St Gerrit (Smith), St Emma (Hardinge), St Ralph (W. Emerson), St Selden (J. Finney), St Theodore (Parkar), &c.; and A Stellar Key to the Summer Land (1868) and Views of Our Heavenly Home (1878), each with illustrative diagrams. Davis was much influenced by Swedenborg and by the Shakers, who reprinted his panegyric of Ann Lee in an official Sketch of Shakers and Shakerism (1884).

DAVIS, CHARLES HOWARD (1837-1901), American landscape painter, was born at East Cambridge, Massachusetts, on the 2nd of February 1857. A pupil of the schools of the Boston Museum of Fine Arts and of the National Academy of Design, he studied at the Academy Julian under Lefebvre and Boulanger. He went to Barbizon and painted much in the forest of Fontainebleau under the traditions of the "men of thirty." He became a full member of the National Academy of Design in 1866, and received many awards, including a silver medal at the Paris Exhibition of 1880. He is represented by important works in the Metropolitan Museum of Art, New York; the Corcoran Art Gallery, Washington; the Pennsylvania Academy, Philadelphia, and the Boston Museum of Fine Arts.

DAVIS, CUSHMAN KELLOGG (1838-1900), American political leader and lawyer, was born in Henderson, New York, on the 16th of June 1838. He was taken by his parents to Wisconsin Territory in the year of his birth, and was educated at Carroll College, Waukesha, Wisconsin, and at the university of Michigan, from which he graduated in 1857. After studying law in the office of Alexander W. Randall, he was admitted to the bar in 1860. During the Civil War, as a first lieutenant of Federal volunteers, he served in the western campaigns of 1862 and 1865, and in 1865 was an agent of the General legislature, which called upon him to resign (1867). Resigning his commission (1864) on account of ill-health, he soon settled in St Paul, Minnesota, where he practised law in partnership with General Gorman, and soon became prominent both at the bar and, as a Republican, in politics. He served in the state House of Representatives in 1867, 1868-1873 was United States district attorney for Minnesota. In 1874-1876 he was a member of the United States Senate. In the Senate he was one of the acknowledged leaders of his party, an able and frequent speaker and a committee worker of great industry. In March 1897 he became chairman of the committee on foreign relations at a time when its work was peculiarly influential in shaping American foreign policy. His extensive knowledge of international law, and his tact and diplomacy, enabled him to render services of the utmost importance in connexion with the Spanish-American War, and he was one of the peace commissioners who negotiated and signed the treaty of Paris by which the war was terminated. He died at St Paul on the 27th of November 1900. Few public men in the United States since the Civil War have combined skill in diplomacy, constructive statesmanship, talent for political organization, oratorical ability and broad culture to such a degree as Senator Davis.

In addition to various speeches and public addresses, he published an essay entitled The Law of Shakespeare (1899).

DAVIS, HENRY WILLIAM BANKS (1833-1913), English painter, received his art training in the Royal Academy schools, where he was awarded two silver medals, and was elected an associate of the Academy in 1873, and academican in 1877. He made a considerable reputation as an accomplished painter of quiet pastoral subjects and carefully elaborated landscapes with cattle. His pictures, "Returning to the Fold" (1880), and "Approaching Night" (1899), bought for the Chantrey Fund Collection, are now in the National Gallery of British Art (Tate Gallery).

DAVIS, HENRY WINTER (1817-1895), American political leader, was born at Annapolis, Maryland, on the 16th of August 1817. His father, Rev Henry Lyon Davis (1775-1836), was a prominent Protestant Episcopal clergyman of Maryland, and for some years president of St John's College at Annapolis. The son graduated at Kenyon College, Gambier, Ohio, in 1837, and from the law department of the university of Virginia in 1841, and began the practice of law in Alexandria, Virginia, but in 1850 removed to Baltimore, Maryland, where he won a high position at the bar. Early becoming imbued with strong anti-slavery views, though by inheritance he was himself a slave holder, he began political life as a Whig, but when the Whig party disintegrated, he became an "American" or "Know-Nothing," and as such served in the national House of Representatives from 1850 to 1861. By his independent course in Congress he won the respect and esteem of all political groups. In the contest over the speakership at the opening of the Thirty-Sixth Congress (1859) he voted with the Republicans, thereby incurring a vote of censure from both houses of Congress, which he indignantly resisted. In 1860, not being quite ready to ally himself wholly with the Republican party, he declined to be a candidate for the Republican nomination for the vice-presidency, and supported the Bell and Everett ticket. He was himself defeated in this year for re-election to Congress. In the winter of 1860-1861 he was active on behalf of compromise measures. Finally, after President Lincoln's election, he became a Republican, and as such was re-elected in 1862 to the national House of Representatives, in which he at once became one of the most radical and aggressive members, his views commanding especial attention owing to his being one of the few representatives from a slave state. From December 1863 to March 1865 he was chairman of the committee on foreign affairs; as such, in 1864, he was unwilling to leave the precious questions concerning the French occupation of Mexico entirely in the hands of the president and his secretary of state, and brought in a report very hostile to France, which was adopted in the House, but fortunately, as it proved later, was not adopted by the Senate. With other radical Republicans Davis was a bitter opponent of the Radical Reconstruction of the Southern States, and on the 5th of February 1864 he reported from committee a bill placing the process of reconstruction under the control of Congress, and stipulating that the Confederate States, before resuming their former status in the Union, must disfranchise all important civil and military officers of the Confederacy, abolish slavery, and repudiate all debts incurred by or with the sanction of the Confederate government. In his speech supporting this measure Davis declared that until Congress should "recognize a government established under its auspices, there is no government in the rebel states save the authority of Congress." The bill—the first formal expression by Congress with regard to Reconstruction—did not pass both Houses until the closing hours of the session, and failed to receive the approval of the president, who on the 8th of July issued a proclamation defining his position. Soon afterwards, on the 5th of August 1864, Davis joined Benjamin F. Wade of Ohio, who had piloted the bill through the Senate, in issuing the so-called "Wade-Davis Resolution," which drastic measure was denounced by President Lincoln for encroaching on the domain of Congress and insinuated that the presidential policy would leave slavery unimpaired in the reconstructed states. In a debate in Congress some months later he declared, "When I came into Congress ten years ago this was a government of law. I have lived to see it a government of personal will." He was one of the radical leaders who preferred Frémont to Lincoln in 1864, but subsequently withdrew his opposition and supported the President for re-election. He early favoured the enlistment of negroes, and in July 1865 publicly advocated the extension of the suffrage to them. He was not a candidate for re-election to Congress in 1864, and died in Baltimore, Maryland, on the 30th of December 1865. Davis was a man of scholarly tastes, an orator of unusual ability and
great eloquence, tireless and fearless in fighting political battles, but impulsive to the verge of rashness, impractical, tactless and
autocratic. He wrote an elaborate political work entitled The
War of Ornmaid and Ahriman in the Nineteenth Century (1853), in
which he submitted the contention that slavery was a
divine institution.

See The Speeches of Henry Winter Davis (New York, 1867), to
which is prefixed a eulogy on his life and character delivered in
the House of Representatives by Senator J. A. J. Creswell of Maryland.

DAVIS, JEFFERSON (1808–1889), American soldier and states-
man, president of the Confederate states in the American Civil
War, was born on the 3rd of June 1808 at what is now the village of
Fairview, in that part of Christian county, Kentucky, which was
later organized as Todd county. His father, Samuel Davis
(1756–1824), who served in the War of Independence, was of
Welsh, and his mother, Jane Cook, of Scotch-Irish descent;
during his infancy the family moved to Wilkinson county,
Mississippi. Jefferson Davis was educated at Transylvania
University (Lexington, Kentucky) and at the United States
Military Academy at West Point. From the latter he graduated in
July 1828, and became by brevet a second lieutenant of
infantry. He was assigned for duty to Jefferson Barracks at St
Louis, and on reaching this post was ordered to Fort Crawford,
near Prairie du Chien, Wisconsin. In 1832 he was elected
by the Black Hawk War, was present at the capture of
Black Hawk, and was sent to Dixon, Illinois, to muster into
service some volunteers from that state. Their captain was
Abraham Lincoln, and Lieutenant Davis is said to have
administered to him his first oath of allegiance. In June 1835
he resigned from the army, married Miss Knox Taylor, daughter
of Colonel (later General) Zachary Taylor, and became a cotton
planter in Warren county, Miss. In September of the same
year, while visiting in Louisiana to escape the fever, his wife
died of it and Davis himself was dangerously ill. For the next
few months he travelled to regain his health; and in the spring
of 1836 returned to his cotton plantation, where for several years
he devoted his time largely to reading political philosophy,
political economy, public law and the English classics, and by
careful management of his estate he acquired considerable wealth.
In 1833 Davis entered the field of politics as a Democrat, and
exhibited great power as a public speaker. In 1834 he was chosen
as a presidential elector on the Polk and Dallas ticket; in
February 1845 he married Varina Howell (daughter of Governor Richard
Howell of New Jersey), and in the same year became a Democratic
representative in Congress. From the beginning of his political career he
advocated a strict construction of the Federal constitution.
He was an ardent admirer of John C. Calhoun, and eventually
became his successor as the leader of the South. In his rare
speeches in the House of Representatives he clearly defined his
position in regard to states rights, which he consistently held
ever afterwards. During his first session, war with Mexico was
declared, and he resigned his seat in June 1846 to take command of
the first regiment raised in his state—the Mississippi Rifles.
He served in the Northern Campaign under his father-in-law,
General Taylor, and was greatly distinguished for gallantry and
soldierly conduct at Monterey and particularly at Buena Vista,
where he was severely wounded early in the engagement, but
continued in command of his regiment until victory crowned the
American arms. While still in the field he was appointed (May
1847) by President Polk to be brigadier-general of volunteers;
but this appointment Davis declined, on the ground that he had
wars said, "that voluntary and the Constitution reserves to the state
the appointment of all militia officers."

Afterwards, Davis himself, as president of the Confederate States,
was to appoint many volunteer officers.

Upon his return to his home late in 1847 he was appointed to
fill a vacancy in the United States Senate, and in 1850 he was
elected for a full term of six years. He resigned in 1851, but was
again elected in 1857, and continued as a member from that year
until the secession of his State in 1861. As a senator he stood in
the front rank in a body distinguished for ability; his purity
of character and courteous manner, together with his intellectual
gifts, won him the esteem of all parties; and he became more and
more the leader of the Southern Democrats. He was, however,
possessed of a logical rather than an intuitive mind. In his
famous speech in the Senate on the 12th of July 1848, on the
question of establishing a government for Oregon Territory, he
held that a slave should be treated by the Federal government
on the same basis as any other property, and therefore that it
was the duty of Congress to protect the owner's right to his slave
in whatever state or territory of the Union that slave might be.
In the debates on the Compromise Measures of 1850 he took
an active part, strongly opposing these measures, while Henry
Stuart Foote (1800–1886), the other Mississippi senator, was one
of their leading advocates. But although still holding to the
theory expounded in his July speech of 1848, he was now ready
with the proposal that slavery might be prohibited north of
latitude 36° 30' N. provided it should not be interfered with in
any territory south of that line. He resigned from the Senate in
1851 to become a candidate of the Democratic States-Rights
party for the governorship of his state against Foote, the can-
didate of the Union Democrats. In the campaign he held, in
opposition to the wishes of the more radical members of his party,
although he was generally supposed to have won the election,
the alternative circumstances were not yet such as to justify it.
A temporary loss of eyesight interfered with his canvass, and
he was defeated by a small majority (1000), the campaign having
been watched with the greatest interest throughout the country.
In 1853 he accepted the position of secretary of war in the
cabinet of President Pierce, and for four years performed the
duties of the office with great distinction and with lasting benefit
to the nation. He organized the engineer companies which
explored and reported on the several proposed routes for a rail-
way connecting the Mississippi valley with the Pacific Ocean;
he effected the enlargement of the army, and made material
changes in its equipment of arms and ammunition, utilizing
the latest improvements; he made his appointments of sub-
ordinates on their merits, regardless of party considerations;
he revised the system of tactics, perfected the signal corps
service, and enlarged the coast and frontier defences of the
country. During all this time he was on terms of intimate
friendship with the president, over whom he undoubtedly exerted
a powerful, but probably not, as is often said, a dominating
influence; for instance he is generally supposed to have won
the president's support for the Kansas-Nebraska Bill of 1854.
After the passage of this bill, Davis, who as secretary of war
had control of the United States troops in Kansas, sympathized
strongly with the pro-slavery party there. At the end of his
service in the cabinet, he was returned to the Senate. To his
insistence in 1860 that the Democratic party should support
his claim to the protection of slavery in the territories by the
Federal government, the disruption of that party was in large
measure due. At the same time he practically told the Senate
that the South would secede in the event of the election of a
radical Republican to the presidency; and on the 10th of
January 1861, not long after the election of Lincoln, he argued
before that body the constitutional right of secession and
declared that the treatment of the South had become such that
it could no longer remain in the Union without being degraded.
When his state had passed the ordinance of secession he resigned
his seat, and his speech on the 21st of January was a clear and
able statement of the position taken by his state, and a most
propagandistic harangue.

On the 16th of January 1861 Davis was commissioned major-
general of the forces Mississippi was raising in view of the
threatened conflict. On the 9th of February he received the
unanimous vote of the Provisional Congress of the seceded
states as president of the "Confederate States of America." He
was inaugurated on the 18th of February, was subsequently, after
the adoption of the permanent constitution, regularly elected by
popular vote, for a term of six years, and on the 2nd of February
1862 was again inaugurated. He had not sought the office,
preferring service in the field. His brilliant career, both as
DAVIS, JOHN

a civilian and as a soldier, drew all eyes to him as best fitted to guide the fortunes of the new Confederacy, and with a deep sense of the responsibility he obeyed the call. He heartily approved of the peace conference, which attempted to draw up a plan of reconciliation between the two sections, but whose failure made war inevitable. Montgomery, in Alabama, was the first Confederate capital, but after Virginia joined her sister states, the seat of government was removed to Richmond, on the 20th of May 1861. How Davis—of whom W. E. Gladstone, in the early days of English sympathy with the South, said that he had "made a nation"—bore himself in his most responsible position during the gigantic conflict which ensued, cannot here be related in detail. (See Confederate States; and American Civil War.) In the shortest time he organized and put into the field one of the finest bodies of soldiers of which history has record. Factories sprang up in the South in a few months, supplying the army with arms and munitions of war, and the energy of the president was everywhere apparent. That he committed serious errors, his warmest admirers will hardly deny. Unfortunately his firmness developed into obstinacy, and exhibited itself in continued confidence in officers who had proved to be failures, and in dislike of some of his ablest generals. He committed the great mistake, too, of directing the movements of distant armies from the seat of government, though those armies were under able generals. This naturally caused great dissatisfaction, and more than once resulted in irreparable disaster. Moreover, he was not, like Lincoln, a great manager of men; he often acted without tact; he was charged with being domineering and autocratic, and at various times he was seriously hampered by the meddling of the Confederate Congress and the opposition of such men as the vice-president, A. H. Stephens, Governor Joseph E. Brown of Georgia, and Governor Zebulon Vance of North Carolina.

During the winter of 1864–1865 the resources of the government showed such exhaustion that it was apparent that the end was near. The country was in chaos, and Davis was clearly stated in the reports of the head departments and of General Lee. President Davis, however, acted as if he was assured of ultimate success. He sent Duncan F. Kenner as special commissioner to the courts of England and France to obtain recognition of the Confederacy on condition of the abolition of slavery. When a conference was held in Hampton Roads on the 3rd of February 1865 between President Lincoln and Secretary Seward on the one side, and A. H. Stephens, R. M. T. Hunter, and Judge James A. Campbell, representing President Davis, on the other, he instructed his representatives to insist on the recognition of the Confederacy as a condition to any arrangement for the termination of the war. This defeated the object of the conference, and deprived the South of terms which would have been more beneficial than those imposed by the conqueror when the end came a few weeks later. The last days of the Confederate Congress were spent in recriminations between that body and President Davis, and the period with which he commenced his administration had almost entirely vanished. In January 1865 the Congress proposed to supersede the president and make General Lee dictator,—a suggestion, however, to which the Confederate commander refused to listen.

After the surrender of the armies of Lee and Johnston in April 1865, President Davis attempted to make his way, through Georgia, across the Mississippi, in the vain hope of continuing the war with the forces of Generals Smith and Magruder. He was taken prisoner on the 10th of May by Federal troops near Irwinville, Irwin county, Georgia, and was brought back to Old Point, Virginia, in order to be confined in prison at Fortress Monroe. In prison he was chained and treated with great severity. He was indicted for treason by a Virginia grand jury, persistent efforts were made to connect him with the assassination of President Lincoln, he was unjustly charged with having deliberately and wilfully caused the sufferings and deaths of Union prisoners at Andersonville and for two years he was denied trial or bail. Such treatment aroused the sympathy of the Southern people, who regarded him as a martyr to their cause, and in a great measure restored him to that place in their esteem which by the close of the war he had lost. It also aroused a general feeling in the North, and when finally he was admitted to bail (in May 1867), Horace Greeley, Gerrit Smith, and others in that section who had been his political opponents, became his sureties. Charles O'Connor, a leader of the New York bar, volunteered to act as his counsel. With him was associated Robert Ould of Richmond, a lawyer of great ability. They moved to quash the indictment on which he was brought to trial. Chief Justice Chase and Judge John C. Underwood constituted the United States circuit court sitting for Virginia before which the case was brought in December 1868; the court was divided, the chief justice voting to sustain the motion and Underwood to overrule it. The matter was thereupon certified to the Supreme Court of the United States, but as the general amnesty of the 25th of December 1868 included Davis, an order of nolle prosequi was entered in February 1869, and Davis and his bonds were thereupon released. After his release he visited Europe, and spent the last years of his life in retirement, during which time he wrote his Rise and Fall of the Confederate Government (2 vols., 1881). In these volumes he attempted to vindicate his administration, and in so doing he attacked the records of those generals he disliked. He also wrote a Short History of the Confederate States of America (1890). He died on the 6th of December 1889, at New Orleans, leaving a widow and two daughters—Margaret, who married J. A. Hayes in 1877, and Varina Anne (1864–1898), better known as "Winnie" Davis, the "daughter of the Confederacy," who was the author of several books, including A Sketch of the Life of Robert E. Lee (1888), a novel, The Veiled Doctor (1893), and A Romance of Summer Seas (1898). A monument to her, designed by George J. Zolnay, and erected by the Daughters of the Confederacy, was unveiled in Hollywood cemetery, Richmond, Va., on the 9th of November 1899. Mrs Davis, who exerted a marked influence over her husband, survived him many years, passed the last years of her life in New York, and died there on the 20th of March 1906. Authorities.—Several biographies and memoirs of Davis have been published, of which the best are: Jefferson Davis, Ex-President of the Confederate States (2 vols., New York, 1890), by his widow; His Friend's Life of Jefferson Davis (Cincinnati, 1868), which defended him from the charges oftreason he was brought against him; E. A. Pollard's Life of Jefferson Davis, with a Secret History of the Southern Confederacy (Philadelphia, 1869), a somewhat partisan arrangement by a prominent Southern journalist; The Life of E. D. Davis, by C. R. E. Davis (1894); and A. B. Davis (1893), which embody the results of recent historical research. The Prison Life of Jefferson Davis (New York, 1866) by John J. Craven (d. 1893), a Federal army surgeon who was Davis's physician at Fortress Monroe, is long popular. It gives a vivid picture of Mr Davis as a prisoner, but its authenticity and accuracy have been questioned. (W. W. H.*; N. D. M.)

DAVIS (or Davis), JOHN (1597–1650), one of the chief English navigators and explorers under Elizabeth, especially in Polar regions, was born at Sandridge near Dartmouth about 1590. From a boy he was a sailor, and early made several voyages with Adrian Gilbert; both the Gilbert and Raleigh families were Devonians of his own neighbourhood, and through life he seems to have profited by their friendship. In January 1583 he appears to have broached his design of a north-west passage to Walsingham and John Dee; various consultations followed; and in 1585 he started on his first north-western expedition. On this he began by striking the ice-bound east shore of Greenland, which he followed south to Cape Farewell; thence he turned north once more and crossed the West Greenland littoral some way, till, finding the sea free from ice, he shaped a "course for China" by the north-west. In 66° N., however, he fell in with Baffin Land, and though he pushed some way up Cumberland Sound, and professed to recognize in this the "hoped strait," he now turned back (end of August). He tried again in 1586 and 1587; in the last voyage he pushed through the straits still named after him into Baffin's Bay, coasting west Greenland to 73° N., almost to Upernavik, and thence making a last effort to find a passage westward along the north of America. Many points in Arctic latitudes (Cumberland Sound, Cape Walsingham, Exeter Sound, &c.) retain names given them by Davis, who ranks with Baffin and Hudson as the greatest of early Arctic explorers and like...
DAVIS, T. O.—DAVIS STRAIT

Frobisher, narrowly missed the discovery of Hudson's Bay via Hudson's Straits (the "Furious Overfall" of Davis). In 1588 he seems to have commanded the "Black Dog" against the Spanish Armada; in 1589 he joined the earl of Cumberland off the Azores; and in 1591 he accompanied Thomas Cavendish on his last voyage, with the special purpose, as he tells us, of searching "that north-west discovery upon the back parts of America." After the rest of Cavendish's expedition returned unsuccessful, he continued to attempt on his own account the passage of the Strait of Magellan; though defeated here by foul weather, he discovered the Falkland Islands. The passage home was extremely disastrous, and he brought back only fourteen of his seventy-six men. After his return in 1593 he published a valuable treatise on practical navigation in The Seaman's Secrets (1594), and a more theoretical work in The World's Hydrographical Description (1595). His invention of back-staff and double quadrant (called a "Davis Quadrant" after him) held the field among English seamen till long after Hadley's reflecting quadrant had been introduced. In 1596-1597 Davis seems to have sailed with Raleigh (as master of Sir Walter's own ship) to Cadiz and the Azores; and in 1598-1600 he accompanied a Dutch expedition to the East Indies as pilot, sailing from Flushing, returning to Middelburg, and narrowly escaping destruction from treachery at Achin in Sumatra. In 1601-1603 he accompanied Sir James Lancaster as first pilot on his voyage in the service of the East India Company; and in December 1604 he sailed again for the same destination as pilot to Sir Edward Michelborne (or Michelbourn). On this journey he was killed by Japanese pirates off Bintang near Sumatra.

A Travers Book made by John Davis in 1587, an Account of his Second Voyage in 1588, and a Report of Master John Davis of his three voyages made for the King in the North West Passage, were printed in Hakluyt's collection. Davis himself published The Seaman's Secrets, divided into two Parts (London, 1594). The World's Hydrographical Description... whereby appears that there is a shore and passage into the South Sea, to the Molucca, Philippina, and India, by Northerly Navigation (London, 1595). Various references to Davis are in the Calendars of State Papers, Domestic (1591-1594), and East Indies (1513-1616). See also Voyages and Discoveries of Sir Francis Drake (London, 1846); Davis, Sir Francis, by W. H. Harland (London, 1846); Davis, Sir Francis, by A. H. Davis (London, 1834); Davis, Sir Francis, by H. G. Davis (Cambridge, 1846). The article "John Davys" is by Sir J. K. Laughton in the Dictionary of National Biography. (C. R. B.)

DAVIS, THOMAS OSBORNE (1814-1845). Irish poet and journalist, was born at Mallow, Co. Cork, on the 14th of October 1814. His father, James Thomas Davis, a surgeon in the royal artillery, who died in the month of his birth, belonged to an English family of Welsh extraction, and his mother, Mary Atkins, belonged to a Protestant Anglo-Irish family. Davis graduated B.A. at Trinity College, Dublin, in 1836, and was called to the bar two years later. Brought up in an English and Tory circle, he was led to adopt nationalist views by the study of Irish history, a complicated subject in which texts-books and the ordinary guides to knowledge were then lacking. In 1840 he made a speech appealing to Irish sentiment before the college historical society, which had been reorganized in 1839. With a view to indoctrinating the Irish people with the idea of nationality he joined John Blake Dillon in editing the Dublin Morning Register. The proprietor very soon dismissed him, and Davis saw that his propaganda would be ineffective if he continued to stand outside the national organization. He therefore announced himself a follower of Daniel O'Connell, and became an energetic worker (1841) on the committee of the repeal association. He helped Dillon and Charles Gavan Duffy to found the weekly newspaper, The Nation, the first number of which appeared on the 15th of October 1842. The paper was chiefly written by these three promoters, and its concentrated purpose and vigorous writing soon attracted attention. Davis, who had never written verse, was induced to attempt it for the new venture. The Lament of Owen Roe O'Neill was printed in the eighth number, following a series of lyrics that take a high place in Irish national poetry—"The Battle of Fontenoy," "The Geraldines," "Muir Bhán a Stóir," and many others. Davis contemplated a history of Ireland, an edition of the speeches of Irish orators, one volume of which appeared, and a life of Wolfe Tone. These projects remained incomplete, but Davis's determination and continuous zeal made their mark on his party. Differences arose between O'Connell and the young writers of The Nation, and as time went on became more pronounced. Davis was accused of being anti-Catholic, and was systematically attacked by O'Connell's followers. But he differed, said Sir Charles Gavan Duffy, from earlier and later Irish tribunes, "by a perfectly genuine desire to remain unknown, and reap neither recognition nor reward for his work." His early death from scarlet fever (September 15th, 1845) deprived "Young Ireland" of its most striking personality.

His Poems and his Literary and Historical Essays were collected in The Works of T. O. Davis (London, 1866). There is a picture of him in the Besant's Catalogue of the National Portrait Gallery, and in the Dictionary of National Biography, 1885 (as "Davis, T. O."). (W. W. O.)

DAVISON, WILLIAM (c. 1547—1608), secretary to Queen Elizabeth, was of Scottish descent, and in 1566 acted as secretary to Henry Killigrew (d. 1603), when he was sent into Scotland by Elizabeth on a mission to Mary, queen of Scots. Remaining in that country for about ten years, Davison then went twice to the Netherlands on diplomatic business, returning to England in 1586 to defend the hasty conduct of his friend, Robert Dudley, earl of Leicester. In the same year he became member of parliament for Knaresborough, a privy councillor, and assistant to Elizabeth's secretary, Thomas Walsingham; but he soon appears to have acted rather as the colleague than the subordinate of Walsingham. He was a member of the commission appointed to try Mary, queen of Scots, although he took no part in its proceedings. When sentence was passed upon Mary the warrant for her execution was entrusted to Davison, who, after some delay, obtained the queen's signature. On this occasion, and also in subsequent interviews with her secretary, Elizabeth suggested that Mary should be executed in some more secret fashion, and her conversation afforded ample proof that she disliked to take upon herself any responsibility for the death of her rival. Meanwhile, the privy council having been summoned by Lord Burghley, it was decided to carry out the sentence at once, and Mary was beheaded on the 8th of February 1587. When the news of the execution reached Elizabeth she was extremely indignant, and her wrath was chiefly directed against Davison, who, she asserted, had disobeyed her instructions not to part with the warrant. The secretary was arrested and thrown into prison, but, although he defended himself vigorously, he did not say anything about the queen's wish to get rid of Mary by assassination. Charged before the Star Chamber with misprision and contempt, he was acquitted of evil intent, but was sentenced to pay a fine of 10,000 marks, and to imprisonment during the queen's pleasure; but owing to the exertions of several influential men he was released in 1589. The queen, however, refused to employ him again in her service, and he retired to Stepien, where he died in December 1608. Davison appears to have been an industrious and outspoken man, and was undoubtedly made the scapegoat for the queen's passionate conduct. By his wife, Catherine Spelman, he had a family of four sons and two daughters. Two of his sons, Francis and Walter, obtained some celebrity as poets.

Many state papers written by him, and many of his letters, are extant in various collections of manuscripts. See Sir N. H. Nicolas, Life of W. Davison (London, 1823); J. A. Froude, History of England (1876); C. H. Husey, History of the United Provinces 1580-1600; and Correspondence of Leicester during his Government of the Low Countries, edited by J. Bruce (London, 1844).

DAVIS STRAIT, the broad strait which separates Greenland from North America, and connects Baffin Bay with the open Atlantic. At its narrowest point, which occurs just where the Arctic Circle crosses it, it is nearly 200 m. wide. This part is also the shallowest, a sounding of 112 fathoms being found in the Greenland Channel; the depth increases toward the south, reaching 5,300 fathoms in Point Hope, at the entrance of the Bering Sea. Along the western shore (Baffin Land) a cold current passes southward; but along the east there is a warm northward stream, and there are a few Danish settlements on the Greenland coast. The strait takes its name from the explorer John Davis.
DAVITT—DAVOUT

DAVITT, MICHAEL (1846–1906), Irish Nationalist politician, son of a peasant farmer in Co. Mayo, was born on the 25th of March 1846. His father was evicted for non-payment of rent in 1851, and migrated to Lancashire, where at the age of ten the boy began work in a cotton mill at Haslington. In 1857 he lost his right arm by a machinery accident, and he had to employ himself as a newsboy and printer's "devil." He drifted into the ranks of the Fenian brotherhood in 1865, and in 1870 he was arrested for treason-felonies in arranging for sending fire-arms into Ireland, and was sentenced to fifteen years' penal servitude. After seven years he was released on ticket of leave. He at once rejoined the "Irish Republican Brotherhood," and went to the United States, where his mother, herself of American birth, had settled with the rest of the family, in order to concert plans with the Fenian leaders there. Returning to Ireland he helped C. S. Parnell to start the Land League in 1879, and his violent speeches resulted in his re-arrest and consignment to Portland by Sir William Harcourt, then home secretary. He was released in 1882, but was again prosecuted for seditious speeches in 1883, and suffered three months' imprisonment. He had been elected to parliament for Meath as a Nationalist in 1882, but always contested the seat. He was included as one of the respondents before the Parnell Commission (1888-1890) and spoke for five days in his own defence, but his prominent association with the revolutionary Irish schemes was fully established. (See PARNELL.) He took the anti-Parnellite side in 1890, and in 1892 was elected to parliament for North Meath, but was unseated on petition. He was then returned for North-East Cork, but had to vacate his seat through bankruptcy, caused by the costs in the North Meath petition. In 1893 he was elected for West Mayo, but retired before the dissolution in 1900. He died on the 31st of May 1906, in Dublin. A sincere but embittered Nationalist, anti-English to the backbone, anti-clerical, and sceptical as to the value of the purely parliamentary agitation for Home Rule, Davitt was a notable representative of the survival of the Irish "physical force" party, and a strong link with the extremists in America. In later years his Socialistical Radicalism connected him closely with the Labour party. He wrote constantly in American and colonial journals, and published some books on the weakest bias against English methods; but his force of character earned him at least the respect of those who could make calm allowance for an open enemy of the established order, and a higher meed of admiration from those who sympathized with his objects or were not in a position to be threatened by them.

DAVOS (Romonsch Tavaus, a name variously explained as meaning a sheep pasture or simply "behind"), a mountain valley in the Swiss canton of the Grisons, lying east of Coire (whence it is 40 m. distant by rail), and north-west of the Lower Engadine (accessible at Surs in 18 m. by road). It contains two main villages, 2 m. from each other, Dorfli and Platt (the chief hamlet), which are 591 ft. above the sea-level, and had a population in 1900 of 8089, a figure exceeded in the Grisons only by the capital Coire. Of the population 5391 were Protestants, 2564 Romanists, and 81 Jews; while 6048 were German-speaking and 486 Romonsch-speaking. In 1860 the population was only 1705, rising to 2002 in 1870, to 3865 in 1880, to 3891 in 1888, and to 8089 in 1890. This steady increase is due to the fact that the valley is now much frequented in winter by consumptive patients, as its position, sheltered from cold winds and exposed to brilliant sunshine in the daytime, has a most beneficial effect on invalids in the first stages of that terrible disease. A local doctor, by name Spengler, first noticed this fact about 1865, and the valley soon became famous. It is now provided with excellent hotels, sanatoria, &c., but as lately as 1860 there was only one inn there, housed in the 16th-century Rathhaus (town hall), which is still adorned by the heads of wolves shot in the neighbourhood. At the north end of the valley is the fine lake of Davos, used for skating in the winter, while from Platz the splendidly engineered Landwasserstrasse leads (20 m.) down to the Alvanneubad station on the Albula railway from Coire to the Engadine.

We first hear of Tavaus or Tavauns in 1160 and 1213, as a mountain pasture or "alp." It was then in the hands of a Romonsch-speaking population, as is shown by many surviving field names. But, some time between 1260 and 1283, a colony of German-speaking persons from the Upper Valais (first mentioned in 1280) was planted there by its lord, Walter von Vaz, so that it has long been a Teutonic island in the midst of a Romonsch-speaking population. Historically it is associated with the Prattigau or Landquart valley to the north, as it was the most important village of the region, and in 1436 became the capital of the League of the Ten Jurisdictions. (See GRISONs.) It formerly contained many iron mines, and belonged from 1477 to 1649 to the Austrian Habsburgs. In 1779 Davos was visited and described by Archdeacon W. Coxe. (W. A. B. C.)

DAVOUT, LOUIS NICOLAS, duke of Auersstädt and prince of Eckmühl (1770–1823), marshal of France, was born at Annoux (Yonne) on the 10th of May 1770. His name is also, less correctly, spelt Davot and Davout. He entered the French army as a sub-lieutenant in 1788, and on the outbreak of the Revolution he embraced its principles. He was chef de bataillon in a volunteer corps in the campaign of 1792, and distinguished himself at Neerwinden. In the following spring he had just been promoted general of brigade when he was removed from the field of battle as being of noble birth. He served, however, in the campaigns of 1794–1797 on the Rhine, and accompanied Désaix in the Egyptian expedition of Bonaparte. On his return he took part in the campaign of Marengo under Napoleon, who placed the greatest confidence in his abilities, made him a general of division soon after Marengo, and in 1801 gave him a command in the consular guard. At the accession of Napoleon as emperor, Davout was one of the generals who were created marshals of France. As commander of the III. corps of the Grande Armée Davout rendered the greatest services. At Austerlitz, after a forced march of forty-eight hours, the III. corps bore the brunt of the allies' attack. In the Jena campaign Davout with a single corps fought and won the brilliant victory of Auersstädt against the main Prussian army. (See NAPOLEONIC CAMPAIGNS.) He took part, and added to his renown, in the campaign of Eylau and Friedland. Napoleon left him as governor-general in the grand-duchy of Spandau after the treaty of Tilsit put an end to the war (1807), and in 1808 created him duke of Auersstädt. In the war of 1809 Davout took a brilliant part in the actions which culminated in the victory of Eckmühl, and had an important share in the battle of Wagram (q.v.). He was created prince of Eckmühl about this time. It was Davout who was entrusted by Napoleon with the task of organizing the "corps of observation of the Elbe," which was in reality the gigantic army with which the emperor invaded Russia in 1812. In this Davout commanded the I. corps, over 70,000 strong, and defeated the Russians at Mohilev before he joined the main army, with which he continued throughout the campaign and the retreat from Moscow. In 1813 he commanded the Hamburg military district, and defended Hamburg, a city ill fortified and provisioned, and full of disaffection, through a long siege, only surrendering the place on the direct order of Louis XVIII. after the fall of Napoleon in 1814.

Davout's military character was on this, as on many other occasions, interpreted as cruel and rapacious, and he had to defend himself against many attacks upon his conduct and character by the illustrous Hans von der Tann. He was a stern disciplinarian, almost the only one of the marshals who exacted rigid and precise obedience from his troops, and consequently his corps was more trustworthy and exact in the performance of its duty than any other. Thus, in the earlier days of the Grande Armée, it was always the III. corps which was entrusted with the most difficult part of the work in hand. The same criterion is to be applied to his conduct of civil affairs. His incapacity was in reality Napoleon's, for he gave the same undeviating obedience to superior orders which he enforced in his own subordinates. As for his military talents, he was admitted by his contemporaries and by later judgment to be one of the ablest, perhaps the ablest, of all Napoleon's marshals. On the first restoration he retired into private life, openly dispyling his hostility to the Bourbons, and when Napoleon returned from Elba, Davout at once joined him.
Davy, Sir Humphry

Appointed minister of war, he reorganized the French army as far as the limited time available permitted, and he was so far indispensable to the war department that Napoleon kept him at Paris during the Waterloo campaign. To what degree his skill and bravery would have altered the fortunes of the campaign of 1815 can only be surmised, but it has been made a ground of criticism against Napoleon that he did not avail himself in the field of the services of the best general he then possessed. Davout directed the gallant, but hopeless, defence of Paris after Waterloo, and was deprived of his marshalate and his titles at the second restoration. When some of his subordinate generals were proscribed, he demanded to be held responsible for their acts, as executed under his orders, and he endeavoured to prevent the condemnation of Ney. After a time the hostility of the Bourbons towards Davout died away, and he was reconciled to the monarchy. In 1817 his rank and titles were restored, and in 1819 he became a member of the chamber of peers. He died at Paris on the 1st of June 1829.

See the marquis de Blosqueville, Le Maréchal Davout raconté par les siens et lui-même (Paris, 1870–1880, 1887); Chenier, Davout, duc d’Auerswald (Paris, 1886).

Davy, Sir Humphry, Bart. (1778–1829), English chemist, was born on the 17th of December 1778 at or near Penzance in Cornwall. During his school days at the grammar schools of Penzance and Truro he showed few signs of a taste for scientific pursuits or indeed of any special zeal for knowledge or of ability beyond a certain skill in making verse translations from the classics and in story-telling. But when in 1794 his father, Robert Davy, died, leaving a widow and five children in embarrassed circumstances, he awoke to his responsibilities as the eldest son, and becoming apprentice to a surgeon-apothecary at Penzance set to work on a systematic and remarkably wide course of self-instruction which he mapped out for himself in preparation for a career in medicine. Beginning with metaphysics and ethics and later turning on to mathematics, he turned to chemistry at the end of 1797, and within a few months of reading Nicholson’s and Lavoisier’s treatises on that science had produced a new theory of light and heat.

About the same time he made the acquaintance of two men of scientific attainments—Gregory Watt (1777–1804), a son of James Watt, and Davies Giddy, afterwards Gilbert (1767–1839), who was president of the Royal Society from 1827 to 1831. By the latter he was recommended to Dr Thomas Beddoes, who was in 1798 establishing his Medical Pneumatic Institution at Bristol for investigating the medicinal properties of various gases. Here Davy, released from his indentures, was installed as superintendent towards the end of 1798. Early next year two papers from his pen were published in Beddoes’s West Country Contributions—one “On Heat, Light, and the Combinations of Light, with a New Theory of Respiration and Observations on the Chemistry of Life,” and the other “On the Generation of Phosgene (Oxygen gas) and the Causes of the Deaths of Organic Beings.” These contain an account of the well-known experiment in which he sought to establish the immateriality of heat by showing its generation through the friction of two pieces of ice in an exhausted vessel, and further attempt to prove that light is “a matter of a peculiar kind,” and that oxygen gas, being a compound of this matter with a simple substance, would more properly be termed phos- oxygen. Founded on faulty experiments and reasoning, the views he expressed were either ignored or ridiculed; and it was long before he bitterly regretted the temerity with which he had published his hasty generalizations.

One of his first discoveries at the Pneumatic Institution on the 3rd of April 1799 was that pure nitrous oxide (laughing gas) is perfectly respirable, and he narrates that on the next day he became “absolutely intoxicated” through breathing sixteen quarts of it for “near seven minutes.” This discovery brought both him and the Pneumatic Institution into prominence. The gas itself was inhaled by Southey and Coleridge among other distinguished people, and promised to become fashionable, while further research yielded Davy material for his Researches, Chemical and Philosophical, chiefly concerning Nitrous Oxide, published in 1800, which secured his reputation as a chemist. Soon afterwards, Count Rumford, requiring a lecturer on chemistry for the recently established Royal Institution in London, opened negotiations with him, and on the 16th of February 1801 he was engaged as assistant lecturer in chemistry and director of the laboratory. Ten weeks later, having “given satisfactory proofs of his talents” in a course of lectures on galvanism, he was appointed lecturer, and his promotion to be professor followed on the 31st of May 1802. One of the first tasks imposed on him by the managers was the delivery of a course of lectures on the chemical principles of tanning, and he was given leave of absence for July, August and September 1801 in order to acquaint himself practically with the subject. The main facts he discovered from his experiments in this connexion were described before the Royal Society in 1803. In 1802 the board of agriculture requested him to direct his attention to agricultural subjects; and in 1803, with the acquiescence of the Royal Institution, he gave his first course of lectures on agricultural chemistry and continued them for ten successive years, ultimately publishing their substance as Elements of Agricultural Chemistry in 1813.

But his chief interest at the Royal Institution was with electro-chemistry. Galvanic phenomena had already engaged his attention before he left Bristol, but in London he had at his disposal a large battery which gave him much greater opportunities. His first communication to the Royal Society, read in June 1801, related to galvanic combinations formed with single metallic plates and fluids, and showed that an electric cell might be constructed with a single metal and two fluids, provided one of the fluids was capable of oxidizing one surface of the metal; previous piles had consisted of two different metals, or of one plate of metal and the other of charcoal, with an interposed fluid. Five years later he delivered before the Royal Society his first Bakerian lecture, “On some Chemical Agencies of Electricity,” which J. J. Berzelius described as one of the most remarkable memoirs in the history of chemical theory. He summed up his results in the generality of statement that “hydrogen, the alkaline substances, the metals and certain metallic oxides are attracted by negatively electrified metallic surfaces, and repelled by positively electrified metallic surfaces; and contrariwise, that oxygen and acid substances are attracted by positively electrified metallic surfaces and repelled by negatively electrified metallic surfaces; and these attractive and repulsive forces are sufficiently energetic to destroy or suspend the usual operation of elective affinity.” He also sketched a theory of chemical affinity on the facts he had discovered, and concluded by suggesting that the electric decomposition of neutral salts might in some cases admit of economical applications and lead to the isolation of the true elements of bodies. A year after this paper, which gained him from the French Institute the medal offered by Napoleon for the best experiment made each year on galvanism, he described in his second Bakerian lecture the electrolytic preparation of potassium and sodium, effected in October 1807 by the aid of the new battery. According to his cousin, Edmund Davy,1 then his laboratory assistant, he was so delighted with this achievement that he danced about the room in ecstasy. Four days after reading his lecture his health broke down, and severe illness kept him from his professional duties until March 1808. As soon as he was able to work again he attempted to obtain the metals of the alkaline earths by the same methods as he had used for those of the fixed alkalis, but they eluded his efforts and he only succeeded in preparing them as amalgams with mercury, by a process due to Berzelius. His attempts to decompose “alumina, silica, zircon and glauconite” were still less fortunate. At the end of 1808 he read his third Bakerian lecture, one of the longest of his papers but not one of the best. In it he disproved the idea advanced by Gay Lussac that potassium was a compound of hydrogen, not an element; but on the other hand he cast doubts on the elementary

1 Edmund Davy (1785–1857) became professor of chemistry at Cork Institution in 1813, and at the Royal Dublin Society in 1826. His son, Edmund William Davy (born in 1826), was appointed professor of medicine at the Royal College, Dublin, in 1876.
character of phosphorus, sulphur and carbon, though on this point he afterwards corrected himself. He also described the preparation of boron, for which at first he proposed the name boracium, with the impression that it was a metal. About this time a voluntary subscription among the members of the Royal Institution put him in possession of a new galvanic battery of 2000 double plates, with a surface equal to 138,000 sq. in., to replace the old one, which had become unserviceable. His fourth Bakerian lecture, in November 1809, gave further proofs of the elementary nature of potassium, and described the properties of tellurated hydrogen. Next year, in a paper read in July and in his fifth Bakerian lecture in November, he argued that oxymuriatic acid, contrary to his previous belief, was a simple body, and proposed for it the name “chlorine.”

Davy’s reputation was now at its zenith. As a lecturer he could command an audience of little less than 1000 in the theatre of the Royal Institution, and his fame had spread far outside London. In 1810, at the invitation of the Dublin Society, he gave a course of lectures on electro-chemical science, and in the following year he again lectured in Dublin, on chemistry and geology, receiving large fees at both visits. During his second visit Trinity College conferred upon him the honorary degree of L.L.D., the only university distinction he ever received. On the 8th of April 1812 he was knighted by the prince regent; on the 9th he gave his farewell lecture as professor of chemistry of the Royal Institution; and on the 11th he was married to Mrs Apreece, daughter and heiress of Charles Kerr of Kelso, and a distant connexion of Sir Walter Scott. A few months after his marriage he published the first and only volume of his Elements of Chemical Philosophy, with a dedication to his wife, and was also re-elected professor of chemistry at the Royal Institution, though he would not pledge himself to deliver lectures, explaining that he wished to be free from the routine of lecturing in order to have more time for original work. Towards the end of the year he began to investigate chloride of nitrogen, which had just been discovered by P. L. Dulong, but was obliged to suspend his inquiries during the winter on account of injury to his eye caused by an explosion of that substance. In the spring of 1813 he was engaged on the chemistry of fluorine, and though he failed to isolate the element, he reached accurate conclusions regarding its nature and properties. In October he started with his wife for a continental tour, and with them, as “assistant in experiments and writing,” went Michael Faraday, who in the previous March had been engaged as assistant in the Royal Institution, having obtained permission from the French emperor to travel in France. In Paris, during his two months’ stay every honour was accorded him, including election as a corresponding member of the first class of the Institute. He does not, however, seem to have reciprocated the courtesy of his French hosts, but gave offence by the brusqueness of his manner, though his supercilious bearing, according to his biographer, Dr Paris, was to be ascribed less to any conscious superiority than to an “ungraceful timidity which he could never conquer.” Nor was his action in regard to iodine calculated to conciliate. That substance, recently discovered in Paris, was attracting the attention of French chemists when he stepped in and, after a short examination with his portable chemical laboratory, detected its resemblance to chlorine and pronounced it an “undecomposed body.” Towards the end of December he left for Italy. At Genoa he investigated the electricity of the torpedo-fish, and at Florence, by the aid of the great burning-glass in the Accademia del Cimento, he effected the combustion of the diamond in oxygen and decided that, beyond containing a little hydrogen, it consisted of pure carbon. Then he went to Rome and Naples and visited Vesuvius and Pompeii, called on Volta at Milan, spent the summer in Geneva, and returning to Rome occupied his winter with an inquiry into the composition of ancient colours.

A few months after his return, through Germany, to London in 1815, he was induced to take up the question of constructing a miner’s safety lamp. Experiments with samples of fire-damp sent from Newcastle soon taught him that “explosive mixtures of mine-damp will not pass through small apertures or tubes”; and in a paper read before the Royal Society on the 9th of November he showed that metallic tubes, being better conductors of heat, were superior to glass ones, and explained that the heat lost by contact with a large cooling surface brought the temperature of the first portions of gas exploded below that required for the firing of the other portions. Two further papers read in January 1816 explained the employment of wire gauze instead of narrow tubes, and later in the year the safety lamps were brought into use in the mines. A large collection of the different models made by Davy in the course of his inquiries is in the possession of the Royal Institution. He took out no patent for his invention, and in recognition of his disinterestedness the Newcastle coal-owners in September 1817 presented him with a dinner-service of silver plate.

In 1818, when he was created a baronet, he was commissioned by the British government to examine the papryi of Herculaneum in the Neapolitan museum, and he did not arrive back in England till June 1820. In November of that year the Royal Society, of which he had become a fellow in 1803, and acted as secretary from 1807 to 1812, chose him as their president, but his personal qualities were not such as to make him very successful in that office, especially in comparison with the tact and firmness of his predecessor, Sir Joseph Banks. In 1821 he was busy with the preparation of the plan of the new Royal Institution, and in 1822 with investigations of the fluids contained in the cavities of crystals in rocks. In 1823, when Faraday liquefied chlorine, he read a paper which suggested the application of liquids formed by the condensation of gases as mechanical agents. In the same year the admiralty consulted the Royal Society as to a means of preserving the copper sheathing of ships from corrosion and keeping it smooth, and he suggested that the copper would be preserved if it were rendered negatively electrical, as would be done by fixing “protectors” of zinc to the sheathing. This method was tried on several ships, but it was found that the bottoms became extremely foul from accumulations of seaweed and shellfish. For this reason the admiralty decided against the plan, much to the inventor’s annoyance, especially as orders to remove the protectors already fitted were issued in June 1825, immediately after he had announced to the Royal Society the full success of his remedy.

In 1826 Davy’s health, which showed signs of failure in 1823, had so declined that he could with difficulty indulge in his favourite sports of fishing and shooting, and early in 1827, after a slight attack of paralysis, he was ordered abroad. After a stay at Mentone, where he remained to Salzburg, whence, his illness continuing, he sent in his resignation as president of the Royal Society. In the autumn he returned to England and spent his time in writing his Salmonsia or Days of Flyfishing, an imitation of The Compleat Angler. In the spring of 1828 he again left England for Illyria, and in the winter fixed his residence at Rome, whence he sent to the Royal Society his “Remarks on the Electricity of the Torpedo,” written at Trieste in October. This, with the exception of a posthumous work, Consolations in Travel, or the Last Days of a Philosopher (1830), was the final production of his pen. On the 20th of February 1829 he suffered a second attack of paralysis which rendered his right side quite powerless, but under the care of his brother, Dr John Davy (1791–1868), he rallied sufficiently to be removed to Geneva, where he died on the 20th of May.

Of a sanguine, somewhat irritable temperament, Davy displayed characteristic enthusiasm and energy in all his pursuits. As is shown by his verses and sometimes by his prose, his mind was highly imaginative; the poet Coleridge declared that if he “had not been the first chemist, he would have been the first poet
of his age," and Southe said that "he had all the elements of a poet; he only wanted the art." In spite of his ungainly exterior and peculiar manner, his happy gifts of exposition and illustration won him extraordinary popularity as a lecturer, his experiments were ingenious and rapidly performed, and Coleridge went to hear him "to increase his stock of metaphors." The dominating ambition of his life was to achieve fame, but though that sometimes betrayed him into petty jealousy, it did not leave him insensible to the claims on his knowledge of the "cause of humanity," to use a phrase often employed by him in connexion with his invention of the miners' lamp. Of the smaller observances of etiquette he was careless, and his frankness of disposition sometimes exposed him to annoyances which he might have avoided by the exercise of ordinary tact.

DAWARI, or DOURI, a Pathan tribe on the Waziri border of the North-West Frontier Province of India. The Dawaris inhabit the Tochi Valley (1.), otherwise known as Dawar or Daur, and are a homogeneous tribe of considerable size, numbering 5000 fighting men. Though surrounded on all four sides by a Waziri population they bear little resemblance to Waziris. They are an agricultural and the Waziris a pastoral race, and they are much richer than their neighbours. They thrive on a rich sedimentary soil copiously irrigated in the midst of a country where cultivable land of any kind is scarce and water in general hardly to be obtained. But they pay a heavy tax in health and wellbeing for the possession of their fertile acres. Fever and other ravaging diseases are bred in the wet sodden lands of the Tochi Valley, lying at the bottom of a deep depression exposed to the burning rays of the sun; and the effects of these ailments may be clearly traced in the drawn or bloated features and the shrunken or swollen limbs of nearly every Dawari that has passed middle life. They have an evil name for indolence, drug-eating and unnatural vices, and are morally the lowest of the Afghan races, but in spite of these defects, and of the contempt with which they are regarded by the other Afghan tribes, they have held their own for centuries against the warlike and hardy Waziris. The secret of this is that the Dawaris stand together, and the Waziris do not, while the weaker race is gifted with infinite patience and tenacity of purpose. With the advent of British government, however, the Dawaris are now secured in the possession of their ancestral lands.

DAWES, HENRY LAURENS (1816-1903), American lawyer, was born at Cummington, Massachusetts, on the 30th of October 1816. After graduating at Yale in 1839, he taught for a time at Greenfield, Mass., and also edited *The Greenfield Gazette*. In 1842 he was admitted to the bar and began the practice of law at North Adams, where for a time he conducted *The Transcript*. He served in the Massachusetts House of Representatives in 1848-1849 and in 1852, in the state Senate in 1850, and in the Massachusetts constitutional convention in 1853. From 1853 to 1857 he was United States district attorney for the western district of Massachusetts; and from 1857-1875 he was a Republican member of the national House of Representatives. In 1875 he succeeded Charles Sumner as senator from Massachusetts, serving until 1893. During this long period of legislative activity he served in the House on the committees on elections, ways and means, and appropriations, took a prominent part in the anti-slavery and reconstruction measures during and after the Civil War, in tariff legislation, and in the establishment of a fish commission and the inauguration of daily weather reports. In the Senate he was chairman of the committee on Indian affairs, and gave much attention to the enactment of laws for the benefit of the Indians. On leaving the Senate, in 1893, he became chairman of the Commission to the Five civilized Tribes (sometimes called the Dawes Indian Commission), and served in this capacity for ten years, negotiating with the tribes for the extinction of the communal title to their land and for the dissolution of the tribal governments, with the object of making the tribes a constituent part of the United States.1 Dawes died at Pittsfield, Mass., on the 6th of February 1903.

DAWES, RICHARD (1798-1876), English classical scholar, was born in or near Market Bosworth. He was educated at the town grammar school under Anthony Blackwall, and at Emmanuel College, Cambridge, of which society he was elected fellow in 1731. His peculiar habits and outspoken language made him unpopular. His health broke down in consequence of his sedentary life, and it is said that he took to bell-ringing at Great St Mary's as a restorative. He was a bitter enemy of Bentley, who he declared knew nothing of Greek except from indexes. In 1738 Dawes was appointed to the master-ships of the grammar school, Newcastle-on-Tyne, combined with that of St Mary's hospital. From all accounts his mind appears to have become unhinged; his eccentricities of conduct and continual disputes with his governing body ruined the school, and finally, in 1749, he resigned his post and retired to Heworth, where he chiefly amused himself with boating. He died on the 21st of March 1766. Dawes was not a prolific writer. The book on which his fame rests is his *Miscellanea critica* (1745), which gained the commendation of such distinguished continental scholars as L. C. Valckenier and J. J. Reiske. The *Miscellanea*, which was re-edited by T. Burgess (1781), G. C. Harles (1800) and T. Kidd (1817), for many years enjoyed a high reputation, and although some of the "canons" have been proved untenable and few can be accepted universally, it will always remain an honourable and enduring monument of English scholarship.

DAWSON, BOGUMIL (1818-1872), German actor, was born at Warsaw, of Jewish parents, and at the age of nineteen went on the stage. In 1830 he received an appointment to the theatre at Lemberg in Galicia. In 1847 he played at Hamburg with marked success, was from 1849 to 1854 a member of the Burg theatre in Vienna, and then became connected with the Dresden court theatre. In 1864 he was given a life engagement, but resigned his appointment, and after touring through Germany visited the United States in 1866. He died in Dresden on the 1st of February 1872. Dawson was considered in Germany an actor of a new type; a leading critic wrote that he and Marie Sceebach "swept like fresh gales over dusty tradition, and brushing aside the monotony of declamation gave to their rôles more character and vivacity than had hitherto been known on the German stage." His chief parts were Mephistopheles, Faust, Mark Antony, Hamlet, Charles V., Richard III. and King Lear.

DAWKINS, WILLIAM BOYD (1838-1915), English geologist and archaeologist, was born at Butteringh vicarage near Welshpool, Montgomeryshire, on the 26th of December 1838. Educated at Rossall School and Oxford, he joined the Geological Survey in 1862, and in 1860 became curator of the Manchester museum, a post which he retains till 1890. He was appointed professor of geology and palaeontology in Owens College, Manchester, in 1874. He paid special attention to the question of the existence of coal in Kent, and in 1882 was selected by the Channel tunnel committee to make a special survey of the French and English coasts. He was also employed in the scheme of a tunnel beneath the Humber. His chief distinctions, however, were won in the realms of anthropology by his researches into the lives of the cave-dwellers of prehistoric times, whose bodies he studied from his books *Cave-hunting* (1874); *Early Man in Britain* (1880); *British Pleistocene Mammalia* (1866-1887). He became a Fellow of the Royal Society in 1867, and acted as president of the anthropological section of the British Association in 1882 and of the geological society in 1888.

1 The commission completed its labours on the 1st of July 1905, after having allotted 20,000,000 acres of land among 90,000 Indians and absorbed the five Indian governments into the national system. The "five tribes" were the Cherokee, Chickasaw, Choctaw, Creek and Seminole Indians.
Daulish, a watering-place in the Ashburton parliamentary division of Devonshire, England, on the English Channel, near the outfall of the Exe, 12 m. S. of Exeter by the Great Western railway. Pop. of urban district (1901) 4003. It lies on a cove sheltered by two projecting headlands. A small stream which flows through the town is lined on both sides by pleasure-gardens. Daulish owes its prosperity to the visitors attracted, in spring and early summer, by the warm climate and excellent bathing. An annual pleasure fair is held on Easter Monday, and a regatta in August or September. Until its sale in the 19th century, the site of Daulish belonged to Exeter cathedral, having been given to the chapter by Leofric, bishop of Exeter, in 1090.

Dawn (the 16th-century form of the earlier "dawning" or "dawning," from an old verb "daw," O. Eng. dagian, to become day; cf. Dutch dagen, and Ger. tagen), the time when light appears (daws) in the sky in the morning. The dawn colours appear in the reverse order of the sunset colours and are due to the same cause. When the sun is lowest in both cases the colour is deep red; this gradually changes through orange to gold and brilliant yellow as the sun approaches the horizon. These colours follow each other in order of refrangibility, reproducing all the colours of the spectrum in another exact order. At the same time the sky of the dawn is austerer and colder than the sunset colours since there is less dust and moisture in the atmosphere and less consequent sifting of light rays.

Dawson, George (1821-1896), English nonconformist divine, was educated in London on the 24th of February 1821, and was educated at Marischal College, Aberdeen, and at the University of Glasgow. In 1843 he accepted the pastorate of the Baptist church at Rickmansworth, and in 1844 a similar charge at Mount Zion, Birmingham, where he attracted large congregations by his eloquence and his unconventional views. Desiring freedom from any definite creed, he left the Baptist church and became minister of the "Church of the Saviour," a building erected for him by his supporters. Here he exercised a stimulating and varied ministry for nearly thirty years, gathering round him a congregation of all types and especially of such as found the dogmas of the age distasteful. He had much sympathy with the Unitarian position, but was not himself a Unitarian. Indeed he had no fixed standpoint, and his views were often compared with those of Emerson and his transcendentalism. His sermons, though not particularly speculative, were unconventional and quickening. He was the friend of Carlyle and Emerson, and did much to popularize their teachings, his influence being conspicuous, especially in his demand for a high ethical standard in everyday life and his insistence on the Christianization of citizenship. He was warmly supported by Dr R. W. Dale, and by J. T. Bunce, editor of The Birmingham Daily Post. Both Dawson and Dale were disqualified as ministers from seats on the town council, but both served on the Birmingham school board. Dawson also lectured on English literature at the Midland Institute and helped to found the Shakespeare Memorial library in Birmingham. He died suddenly at King's Norton on the 30th of November 1876. Four volumes of Sermons, two of Prayers and two of Biographical Lectures were published after his death.

See Life by H. W. Crosskey (1876) and an article by R. W. Dale in Nineteenth Century (August 1877).

Dawson, Sir John William (1820-1899), Canadian geologist, was born at Pictou, Nova Scotia, on the 30th of October 1820. Of Scottish descent, he went to Edinburgh to complete his education, and graduated at the university in 1842, having gained a knowledge of geology and natural history from Robert Jameson. On his return to Nova Scotia in 1842 he accompanied Sir Charles Lyell on his first visit to that territory. Subsequently he was appointed to the post of superintendent of education (1850-1853); at the same time he entered zealously into the geology of the country, making a special study of the fossil forests of the coal-measures. From these strata, in company with Lyell (during his second visit) in 1852, he obtained the first remains of an "air-breathing reptile" named Dendrerpeton. He also described the fossil plants of the Silurian, Devonian and Carboniferous rocks of Canada for the Geological Survey of that country (1851-1873). From 1855 to 1893 he was professor of geology and principal of McGill University, Montreal, an institution which under his influence attained a high reputation. He was elected F.R.S. in 1862. When the Royal Society of Canada was constituted he was the first to occupy the presidential chair, and he also acted as president of the British Association at its meeting at Birmingham in 1886, and of the American Association for the Advancement of Science. Sir William Dawson's name is especially associated with the Eocene canadense, which in 1864 he described as an organism having the structure of a foraminifer. It was found in the Laurentian rocks, regarded as the oldest known geological system. His views on the subject were contested at the time, and have since been disproved, the so-called organism being now regarded as a mineral structure. He was created C.M.G. in 1881, and was knighted in 1884. In his books on geological subjects he maintained a distinctly theological attitude, declining to admit the descent or evolution of man from brute ancestors, and holding that the human species only made its appearance on this earth within a few thousand years. In the Transactions of learned societies, he published Acadian Geology: The geological structure, organic remains and mineral resources of Nova Scotia, New Brunswick, and Prince Edward Island (1861; ed. 3, 1878); Air-breathers of the Coal Period (1863); The Story of the Earth and Man (1873; ed. 6, 1880); The Dawn of Life (1875); Fossil Men and their Modern Representatives (1880); Geological History of Plants (1888); The Canadian Ice Age (1894). He died on the 20th of November 1899.

His son, George Mercer Dawson (1849-1901), was born at Pictou on the 1st of August 1849, and received his education at McGill University and the Royal School of Mines, London, where he had a brilliant career. In 1873 he was appointed geologist and naturalist to the North American boundary commission, and two years later he joined the staff of the geological survey of Canada, of which he became assistant director in 1883, and director in 1895. He was in charge of the Canadian government's Yukon expedition in 1889, and his name is permanently written in Dawson City, of gold-bearing fame. As one of the Bering Sea Commissioners he spent the summer of 1891 investigating the facts of the seal fisheries on the northern coasts of Asia and America. For his services there, and at the subsequent arbitration in Paris, he was made a C.M.G. He was elected F.R.S. in 1891, and in the same year was awarded the Bigsbys medal by the Geological Society of London. He was president of the Royal Society of Canada in 1893. He died on the 2nd of March 1901. He was the author of many scientific papers and reports, especially on the surface geology and glacial phenomena of the northern and western parts of Canada.

Dawson City, or Dawson, the capital of the Yukon territory, Canada, on the right bank of the Yukon river, and in the middle of the Klondyke gold region, of which it is the distributing centre. It is situated in beautiful mountainous country, 1400 ft. above the sea, and 1500 m. from the mouth of the Yukon river. It is reached by a fleet of river steamers, and has telegraphic communication. Founded in 1896, its population soon reached over 20,000 at the height of the gold rush; in 1901 it was officially returns, 1924, and is now not more than 5000. The temperature varies from 90° F. in summer to 5° below zero in winter. It possesses three opera-houses and numerous hotels, and is a typical mining town, though even at first there was much less lawlessness than is usually the case in such cities.

Dax, a town of south-western France, capital of an arrondissement in the department of Landes, 92 m. S.S.W. of Bordeaux, on the Southern railway between that city and Bayonne. Pop. (1906) 8585. The town lies on the left bank of the Adour, a stone bridge uniting it to its suburb of Le Sablar on the right bank. It has remains of ancient Gallo-Roman fortifications, now converted into a promenade. The most remarkable building in the town is the church of Notre-Dame, once a cathedral; it was rebuilt from 1656 to 1710, but still preserves a sacristy, a porch and a fine sculptured doorway of the 13th century. The
church of St Vincent, to the south-west of the town, derives its name from the first bishop, whose tomb it contains. The church of St Paul-le-Dax, a suburb on the right bank of the Adour, belongs mainly to the 13th century, and has a Romanesque apse adorned with curious bas-reliefs. On a hill to the west of Dax stands a tower built in memory of the sailor and scientist Jean Charles Borda, born there in 1751: a statue was erected to him in the town in 1891. Dax, which is well known as a winter resort, owes much of its importance to its thermal waters and mud-baths (the deposit of the Adour), which are efficacious in cases of rheumatism, neuralgia and other disorders. The best-known spring is the Fontaine Chaudie, which issues into a basin 160 ft. wide in the centre of the town. The principal of numerous bathing establishments are the Grands Thermes, the Bains Salés, adjoining a casino, and the Baugnois, which fringe the Adour and are surrounded by gardens. Dax has a sub-prefecture, tribunals of first instance and of commerce, a communal college, a training college and a library. It has salt workings, tanneries, sawmills, manufactures of soap and corks; commerce is chiefly in the pine wood, resin and cork of the Landes, in mules, cattle, horses and tobacco.

Dax (Aquae Tarbellitae, Aquae Augustae later D'Agas) was the capital of the Tarbelli under the Roman domination, when its waters were already famous. Later it was the seat of a viscounty, which in the 11th century passed to the viscounts of Béarn, and in 1177 was annexed by Richard Cœur de Lion to Gascony. The bishopric, founded in the 3rd century, was in 1801 attached to that of Aire.

DAY, JOHN (1574-1640?), English dramatist, was born at Cawston, Norfolk, in 1574, and educated at Ely. He became a sizar of Caius College, Cambridge, in 1592, but was expelled in the next year for stealing a book. He became one of Henslowe's playwrights, collaborating with Henry Chettle, William Haughton, Thomas Dekker, Richard Hathaway and Wentworth Smith, but his almost incessant activity seems to have left him poor enough, to judge by the small loans, of five shillings and even two shillings, that he obtained from Henslowe. The first play in which Day appears as part-author is The Conquest of Brute, with the finding of the Bath (1598), which was the most important of his journeyman's work, is lost. A drama dealing with the early years of the reign of Henry VI, The Blind Beggar of Bednal Green (acted 1600, printed 1659), written in collaboration with Chettle, is his earliest extant work. It bore the sub-title of The Merry Humor of Tom Stroud, the Norfolk Yeoman, and was so popular that second and third parts, by Day and Haughton, were produced in the next year. The Ile of Guls (printed 1606), a prose comedy founded upon Sir Philip Sidney's Arcadia, contains in its light dialogue much satire to which the key is now lost, but Mr Swinburne notes in Manasses'sburlesque of a Puritan sermon a curious anticipation of the eloquence of Mr Chadbald in Bleak House. In 1607 Day produced, in conjunction with William Rowley and George Wilkins, The Travailles of the Three English Brothers, which detailed the adventures of Sir Thomas, Sir Anthony and Robert Shirley.

The Parliament of Bees is the work on which Day's reputation chiefly rests. This exquisite and unique drama, or rather masque, is entirely occupied with "the doings, the births, the wars, the wooings" of bees, expressed in a style at birthtime and most charming. The bees hold a parliament under Proser, the Master Bee, and various complaints are preferred against the humble-bee, the wasp, the drone and other offenders. This satirical allegory of affairs ends with a royal progress of Oberon, who distributes justice to all. The piece contains much for which parallel passages are found in Dekker's Wonder of a Kingdom (1636) and Samuel Rowley's (or Dekker's) Noble Soldier (printed 1634). There is no earlier known edition of The Parliament of Bees than that in 1641, but a persistent tradition has assigned the piece to 1607. In 1608 Day published two comedies, Law Tricles, or Who Would have Thought it? and Humour out of Breath. The date of his death is unknown, but an elegy on him by John Tatham, the city poet, was published in 1640. The six dramas by John Day which we possess show a delicate fancy and dainty inventiveness all his own. He preserved, in a great measure, the dramatic tradition of John Lyly, and affected a kind of subdued euphumin. The Maydes Metamorphosis (1600), once supposed to be a posthumous work of Lyly's, may be an early work of Day's. It possesses, at all events, many of his marked characteristics. His prose Perigrinatic Scholastica or Learninges Pilgrimage, dating from his later years, was printed by Mr A. H. Bullen from a MS. of Day's. Considerations partly based on this work have suggested that he had a share in the anonymous Pilgrimage to Parnassus and the Return from Parnassus. The beauty and ingenuity of The Parliament of Bees were noted and warmly extolled by Charles Lamb; and Day's work has since found many admirers.

His works, edited by A. H. Bullen, were printed at the Chiswick Press in 1881. The same editor included The Maydes Metamorphosis in vol. i. of his Collection of Old Plays. The Parliament of Bees and Humour out of Breath were printed in Nero and other Plays (Mermaid Series, 1888), with an introduction by Arthur Symons. An appreciation by Mr A. C. Swinburne appeared in The Nineteenth Century (October 1897).

DAY, THOMAS (1724-1780), British author, was born in London on the 22nd of June 1748. He is famous as the writer of Sandford and Merton (1783-1789), a book for the young, which, though quaintly didactic and often ridiculous, has had considerable educational value as inculcating manliness and independence. Day was educated at the Charterhouse and at Corpus Christi College, Oxford, and became a great admirer of J. J. Rousseau and his doctrine of the ideal state of nature. Having independent means he devoted himself to a life of study and philanthropy. His views on marriage were typical of the man. He brought up two foundlings, one of whom he hoped eventually to marry. They were educated on the severest principles, but neither acquired the high quality of stoicism which he had looked for. After several proposals of marriage to other ladies had been rejected, he married an heiress who agreed with his ascetic programme of life. He finally settled at Otershaw in Surrey and took to farming on philanthropic principles. He had many curious and impracticable theories, among them one that all animals should be managed by kindness, and while riding an unbroken colt he was thrown near Wargrave and killed on the 28th of September 1780. His poem The Dying Negro, published in 1773, struck the keynote of the anti-slavery movement. It is also obvious from his other works, such as The Devoted Legion (1776) and The Desolation of America (1777), that he strongly sympathized with the Americans during their War of Independence.

DAY (O. Eng. dag, Ger. Tag; according to the New English Dictionary, "in no way related to the Lat. dies"), in astronomy, the interval of time in which a revolution of the earth on its axis is performed. Days are distinguished as solar, sidereal or lunar, according as the revolution is taken relatively to the sun, the stars or the moon. The solar day is the fundamental unit of time, not only in daily life but in astronomical practice. In the latter case, being determined by observations of the sun, it is taken to begin with the passage of the mean sun over the meridian of the place, or at mean noon, while the civil day begins at midnight. A vigorous effort was made during the last fifteen years to recommend the solar day as the time unit in astronomy by beginning the astronomical day at midnight. In some isolated cases this has been done; but the general consensus of astronomers has been against it, the day as used in astronomy being only a measure of time, and having no relation to the period of daily repose. The time when the day shall begin is purely a matter of convenience. The present practice being the dominant one from the time of Ptolemy until the present, it was felt that the confusion in the combination of past and present astronomical observations, and the doubts and difficulties in using the astronomical ephemerides, formed a decisive argument against any change.

The question of a possible variability in the length of the day is one of fundamental importance. One necessary effect of the tidal retardation of the earth's rotation is gradually to increase this length. It is remarkable that the discussion of
ancient eclipses of the moon, and their comparison with modern observations, show only a small and rather doubtful change, amounting perhaps to less than one-hundredth of a second per century. As this amount seems to be markedly less than that which would be expected from the cause in question, it is probable that some other cause tends to accelerate the earth's rotation and so to shorten the day. The moon's apparent mean motion in longitude seems also to indicate slow periodic changes in the earth's rotation; but these are not confirmed by transits of Mercury, which ought also to indicate them. (See Moon and Tides.)

Legal Aspects.—In law, a day may be either a dies naturalis or natural day, or a dies artificialis or artificial day. A natural day includes all the twenty-four hours from midnight to midnight. Fractions of the day are disregarded to avoid dispute, though sometimes the law will consider fractions, as where it is necessary to show the first of two acts. In cases where action must be taken for preserving or asserting a right, a day would mean the natural day of twenty-four hours, but on the other hand, as in cases of supervisiorship, for testamentary or other purposes, it would suffice if a person survived for even the smallest portion of the last day necessary.

When a statute directs any act to be done within so many days, these words mean dear days, i.e. a number of perfect intervening days, not counting the terminal days: if the statute says nothing about Sunday, the days mentioned mean consecutive days and include Sundays. Under some statutes (e.g. the Parliamentary Elections Act 1868, the Corrupt and Illegal Practices Prevention Act 1883) Sundays and holidays are excluded in reckoning days, and consequently all the Sundays, &c., of a prescribed sequence of days would be eliminated. So also, by custom, the word "day" may be understood in some special sense. In bills of lading and charter parties, when "days" or "running days" are spoken of without qualification, they usually mean consecutive days, and Sundays and holidays are counted, but when there is a special phrase, as "in any days, or in any four days, or any charter party required a cargo to be discharged in fourteen days," or "days" will mean working days. Working days, again, vary in different ports, and the custom of the port will decide in each case what are working days. In English charter parties, unless the contrary is expressed, Christmas day and other recognized holidays are included as working days. A weather working day, a term sometimes used in charter parties, means a day when work is not prevented by the weather, and unless so provided for, a day on which work was rendered impossible by bad weather would still be counted as a working day. Lay days, which are days given to the charterer in a charter party either to load or unload without paying for the use of the ship, are days of the week, not periods of twenty-four hours.

Days of Grace.—When a bill of exchange is not payable at sight or on demand, certain days (called days of grace, from being originally a gratuitous favour) are added to the time of payment as fixed by the bill, and the bill is then due and payable on the last day of grace. In the United Kingdom, by the Bills of Exchange Act 1882, three days are allowed as days of grace, but when the last day of grace fails on Sunday, Christmas day, Good Friday or a day appointed by royal proclamation as a public fast or thanksgiving day, the bill is due and payable on the preceding business day. If the last day of grace is a bank holiday (other than Christmas day or Good Friday), or when the last day of grace is a Sunday, and the second day of grace is a bank holiday, the bill is due and payable on the succeeding business day. Days of grace (dies non) are in existence practically among English-speaking peoples only. They were abolished by the French Code (Code de Commerce, Liv. i. tit. 8, art. 133), and by most, if not all, of the European codes since framed.

Civil Days.—An artificial or civil day is, to a certain extent, difficult to define; it "may be regarded as a convenient term to signify the various kinds of 'day' known in legal proceedings other than the natural day" (Enc. English Law, tit. "Day"). The Jews, Chaldeans and Babylonians began the day at the rising of the sun; the Athenians at the fall; the Umbrians in Italy began at midday; the Egyptians and Romans at midnight; and in England, the United States and most of the countries of Europe the Roman civil day still prevails, the day usually commencing as soon as the clock begins to strike 12 P.M. of the preceding day.

In England the period of the civil day may also vary under different statutes. In criminal law the day formerly commenced at sunrise and extended to sunset, but by the Larceny Act 1861 the day is that period between six in the morning and nine in the evening. The same period of time comprises a day under the Housing of the Working Classes Act 1885 and the Public Health (London) Act 1861, but under the Public Health (Scotland) Act 1897 "day" is the period between 9 A.M. and 6 P.M. By an act of 1845, regulating the labour of children in print-works, "day" is defined as from 6 A.M. to 10 P.M. Days, within which distress for rent must be made, is from sunrise to sunset (Tulon v. Darke, 1860, 2 L.T. 361). An obligation to pay money on a certain day is theoretically discharged if the money is paid before midnight of the day on which it falls due, but custom has so far modified this that the law requires reasonable hours to be observed. If, for instance, payment has to be made at a bank or place of business, it must be within business hours.

When an act of parliament is expressed to come into operation on a certain day, it is to be construed as coming into operation on the expiration of the previous day (Interpretation Act 1889, § 36; Statutes [Definition of Time] Act 1880).

Under the orders of the supreme court the word "day" has two meanings. For purposes of personal service of writs, it means any time of the day or night on weekdays, but excludes the time from twelve midnight on Saturday till twelve midnight on Sunday. For purposes of service not required to be personal, it means before six o'clock on any week-day except Saturday, and before 2 P.M. on Saturday.

Closed Days, i.e. Sunday, Christmas day and Good Friday, are excluded from all fixures of time less than six days: otherwise bills are payable on any day on which the time fixed falls on one of those days (R.S.C., ch. 5).

American Practice.—In the United States a day is the space of time between midnight and midnight. The law pays no regard to fractions of a day except to prevent injustice. A "day's work" is by statute in New York fixed at eight hours for all employees except farm and domestic servants, and for employees on railroads at ten hours (Laws 1897, ch. 415). In the recording acts relating to real property, fractions of a day are of the utmost importance, and all deeds, mortgages and other instruments affecting the property, take precedence in the order in which they were filed for record. Days of grace are abolished in many of the seventeen states in which the Negotiable Instruments law has been enacted. Sundays and public holidays are usually excluded in computing time if they are the last day within which the act was to be done. General public holidays throughout the United States are Christmas, Thanksgiving (last Thursday in November), Independence (July 4th), the days of Washington and Lincoln's birthday. The several states have also certain local public holidays. (See also MONTH; TIME.)

DAYLESFORD, a town of Talbot county, Victoria, Australia, 74 m. by rail N.W. of Melbourne. Pop. (1901) 3384. It lies on the flank of the Great Dividing Range, at an elevation of 2030 ft. On Wombat Hill are beautiful public gardens commanding extensive views, and a fine convent of the Presentation Order. Much wheat is grown in the district, and gold-mining, both quartz and alluvial, is carried on. Daylesford has an important mining school. Near the town are the Hepburn mineral springs and a number of beautiful waterfalls, and 6 m. from it is Mount Franklin, an extinct volcano.

DAYTON, a city of Campbell county, Kentucky, U.S.A., on the S. bank of the Ohio river, opposite Cincinnati, and adjoining Bellevue and Newport, Ky. Pop. (1850) 4265; (1890) 6104 including 665 foreign-born and 63 negroes; (1910) 6979. It is served by the Chesapeake & Ohio railway at Newport, of which it is a suburb, largely residential. It has manufactories of watchcases.
and pianos, and whisky distilleries. In the city is the Speers Memorial hospital. Dayton was settled and incorporated in 1840.

**DAYTON.** a city and the county-seat of Montgomery county, Ohio, U.S.A., at the confluence of Wolf Creek, Stillwater river and Mad river with the Great Miami, 37 m. N.E. of Cincinnati and about 70 m. W.S.W. of Columbus. Pop. (1890) 61,220; (1900) 85,333; (1910) 116,577. In 1800 there were 10,053 foreign-born and 3,387 negroes; of the foreign-born 6820 were Germans and 1253 Irish. Dayton is served by the Erie, the Cleveland, Cincinnati, Chicago & St Louis, the Pittsburg, Cincinnati, Chicago & St Louis, the Cincinnati, Hamilton & Dayton, and the Dayton & Union railways, by ten interurban electric railways, centring here, and by the Miami & Erie Canal. The city extends more than 5 m. from E. to W., and 3½ m. from N. to S., lies for the most part on level ground at an elevation of about 740 ft. above sea-level, and numerous good, hard gravel roads radiate from it in all directions through the surrounding country, a fertile farming region which abounds in limestone, used in the construction of public and private buildings. Among the more prominent buildings are the court-house—the portion first erected being designed after the Pantheon—the Steele high school, St Mary's college, Notre Dame academy, the Memorial building, the Arcade building, Relroid building, the Arcade Hotel, the post office and public library (containing 7,500 volumes), the Young Men's Christian Association building and several churches. At Dayton are the Union Biblical seminary, a theological school of the United Brethren in Christ, and the publishing house of the same denomination. By an agreement made in 1907 the school of theology of Ursinus College (Collegeville, Pennsylvania; the theological school since 1838 had been in Philadelphia) and the Heidelberg Theological seminary (Tiffin, Ohio) united to form the Central Theological seminary of the German Reformed Church, which was established in Dayton in 1908. The boulevard and park along the river add attractiveness to the city. Among the charitable institutions are the Dayton state hospital (for the insane), the Miami Valley and the St Elizabeth hospitals, the Christian Deaconess, the Widows' and the Children's homes, and the Door of Hope (for homeless girls); and 1 m. W. of the city is the central branch of the National Home for disabled volunteer soldiers, with its beautifully ornamented grounds, about 1 sq. m. in extent. The Mad river is made to furnish good water-power by means of a hydraulic canal which takes its water through the city, and Dayton's manufactures are extensive, the public library (containing 7,500 volumes), the National Cash Register Company employing in 1907 about 4000 wage-earners. This company is widely known for its "welfare work" on behalf of its operatives. Banks, lunch-rooms, rooms, clubs, lectures, schools and kindergartens have been supplied, and the company has also cultivated domestic pride by offering prizes for the best-kept gardens, &c. From April to July 1901 there was a strike in the already thoroughly unionized factories; complaint was made of the hectoring of union men by a certain foreman, the use in toilet-rooms of towels laundered in non-union shops (the company replied by allowing the men to supply towels themselves), the use on doors of springs not union-made (these were removed by the company), and especially the discharge of four men whom the company refused to reinstate. The company was victorious in the strike, and the factory became an "open shop." In addition to cash registers, the city's manufactured products include agricultural implements, clay-working machinery, cotton-seed and linseed oil machinery, filters, turbines, railway cars (the large Barney-Smith car works employed 800 men in 1905), carriages and wagons, machines (the Davis Sewing Machine Co.), automobiles, clothing machinery, malt liquors, paper, furniture, tobacco and soap. The total value of the manufactured product, under the "factory system," was $31,015,593 in 1900 and $39,567,773 in 1905. Dayton's site was purchased in 1795 by John Cleves Symmes by a charter in the name of Jonathan Dayton (1760–1824), a soldier in the War of Independence, a member of Congress from New Jersey in 1791–1799, and a United States senator in 1799–1805. It was made the county-seat in 1803, was incorporated as a town in 1805, grew rapidly after the opening of the canal in 1828, and in 1841 was chartered as a city.

**DEACON** (Gr. διάκονος, minister, servant), the name given to a particular minister or officer of the Christian Church. The status and functions of the office have varied in different ages and in different branches of Christendom.

(a) The Ancient Church.—The office of deacon is almost as old as Christianity itself, though it is impossible to fix the moment at which it came into existence. Tradition connects its origin with the appointment of the "Seven" recorded in Acts vi. This connexion, however, is questioned by a large number of modern scholars, on the ground that the "Seven" are not called deacons in the New Testament and do not seem to have been identified with them till the time of Irenaeus (A.D. 180).

The first definite reference to the diaconate occurs in St Paul's Epistle to the Philippians (i. 1), where the officers of the church are described as "bishops and deacons"—though it is not unlikely that earlier allusions are to be found in 1 Cor. xii. 28 and Romans xii. 7. In the pastoral epistles the office seems to have been well known, and in the special qualifications are laid down for those who hold it (1 Tim. iii. 8).

By the time of Ignatius (A.D. 110) the "three orders" of the ministry were definitely established, the deacon being the lowest of the three and subordinate to the bishop and the presbyters. The inclusion of deacons in the "three orders" which were regarded as essential to the existence of a true Church sharply distinguished them from the lower ranks of the ministry, and gave them a status and position of importance in the ancient Church.

The functions attaching to the office varied at different times. In the apostolic age the duties of deacon were naturally vague and undefined. They were "helpers" or "servants" of the Church in a general way and served in any capacity that was required of them. With the growth of the episcopate, however, the deacons became the immediate ministers of the bishop. Their duties included the supervision of Church property, the management of Church finances, the visitation of the sick, the distribution of alms and the care of widows and orphans. They were also required to watch over the souls of the flock and report to the bishop the cases of those who had sinned or were in need of spiritual help “in the midst of the people,” says the Apostolic Constitution (4th century), “ought to keep watch over all who need watching or are in distress, and let the bishop know.” With the growth of hospitals and other charitable institutions, however, the functions of deacons became considerably curtailed.

The social work of the Church was transferred to others, and little by little the deacons sank in importance until at last they came to be regarded merely as subordinate officers of public worship, a position which they held in the Roman Church to-day, where their duties are confined to such acts as the following:—censing the officiating priest and the choir, laying the corporal on the altar, handing the paten or cup to the priest, receiving from him the pyx and giving it to the subdeacon, putting the mitre on the archbishop’s head (when he is present) and laying his pall upon the altar.

(b) The Church of England.—The traditionary position of the diaconate as one of the "three orders" is here maintained. Deacons may conduct any of the ordinary services in the church, but are not permitted to pronounce the absolution or consecrate the elements for the Eucharist. In practice the office has become a stepping-stone to the priesthood, the deacon corresponding to the curate in the Presbyterian Church. Candidates for the clerical office must have attained the age of twenty-three and must satisfy the bishop with regard to their intellectual, moral and spiritual fitness. The functions of the office are defined in the Ordinal—"to assist the priest in divine service and specially when he ministereth the Holy Communion, to read Holy Scriptures and Homilies in the church, to instruct the youth in the catechism, to baptize in the absence of the priest, to preach if he be admitted thereto by the bishop, and furthermore to search
for the sick, poor and impotent people and intimate their estates and names to the curate."

(3) *Churches of the Congregational Order.—* In these (which of course include Baptists) the diaconate is a body of laymen appointed by the members of the church to act as a management committee and to assist the minister in the work of the church. There is no general rule as to the number of deacons, though the traditional number of seven is often kept, nor as to the frequency of election, each church making its own arrangements in this respect. The deacons superintend the financial affairs of the church, co-operate with the minister in the various branches of his work, assist in the visitation of the sick, attend to the church property and generally supervise the activities of the church.

**DEACONESS (ἡ δίακονος or διακώνσα, servant, minister),** the name given to a woman set apart for special service in the Christian Church. The origin and early history of the office are veiled in obscurity. It is generally supposed that from the 3rd century onward there existed in the Eastern Church an order of women, known as deaconesses, who filled a position analogous to that of deacons. They are quite distinct from the somewhat similar orders of "virgins" and "widows," who belonged to a lower plane in the ecclesiastical system. The order is recognized in the canons of the councils of Nicaea (325) and Chalcedon (451), and is frequently mentioned in the writings of Chrysostom (some of whose letters are addressed to deaconesses at Constantinople), Epiphanius, Basil, and indeed most of the more important Fathers of the 4th and 5th centuries. Deaconesses, upon entering their office, were ordained much in the same way as deacons, but the ordination conveyed no sacerdotal powers or authority. Epiphanius says quite distinctly that they were woman-clerics and not priestesses in any sense of the term, and that their mission was not to interfere with the functions allotted to priests but simply to perform certain offices in connexion with the care of women. Several specimens of the ordinance service for deaconesses have been preserved (see Cecilia Robinson, *The Ministry of Deaconesses*, London, 1875, appendix b, p. 197). The functions of the deaconesses were as follows: (1) To assist at the baptism of women, especially in connexion with the anointing of the body which in the ancient Church always preceded immersion; (2) to visit the women of the Church in their homes and to minister to the needs of the sick and afflicted; (3) according to the Apostolical Constitutions they acted as doorkeepers in the church, received women as they entered and conducted them to their allotted seats. In the Western Church, on the other hand, we hear nothing of the order till the 4th century, when an attempt seems to have been made to introduce it into Gaul. Much opposition, however, was encountered, and the movement was condemned by the council of Orange in 441 and the council of Epome in 577. In spite of the prohibition the institution made some headway, and traces of it are found later in Italy, but it never became as popular in the West as it was in the East. In the mid-4th century the order fell into abeyance in both divisions of the Church, the abbess taking the place of the deaconess. Deaconesses, in the later sense of the term, existed before 250 is disputed point. The evidence is scanty and by no means decisive. There are only three passages which bear upon the question at all. (i) Romans xvi. 1: Phoebe is called ἡ δίακων, but it is quite uncertain whether the word is used in its technical sense. (ii) 1 Tim. iii. 11: after stating the qualifications necessary for deacons the writer adds, "Women in like manner must be grave—not slanderers," &c.; the Authorized Version took the passage as referring to deaconesses' wives, but many scholars think that by "women" deaconesses are meant. (iii) In Pliny's famous letter to Trajan respecting the Christians of Bithynia mention is made of two Christian maidservants "quae ministrae dicebantur"; whether ministrae is equivalent to διακών, as is often supposed, is dubious. On the whole the evidence does not seem sufficient to prove the contention that an order of deaconesses—in the ecclesiastical sense of the term—existed from the apostolic age.

In modern times several attempts have been made to revive the order of deaconesses. In 1833 Pastor Fielder founded "an order of deaconesses for the Rhenish provinces of Westphalia" at Kaiserswerth. The original aim of the institution was to train nurses for hospital work, but its scope was afterwards extended and it trained its members for teaching and parish work as well. Kaiserswerth became the parent of many similar institutions in different parts of the continent. A few years later, in 1847, Miss Sellon formed for the first time a sisterhood at Devonport in connexion with the Church of England. Her example was gradually followed in other parts of the country, and in 1898 there were over two thousand women living together in different sisterhoods. The members of these institutions do not represent the ecclesiastical deaconesses, however, since they are not ministers set apart by the Church; and the sisterhoods are merely voluntary associations of women banded together for spiritual fellowship and common service. In 1861 Bishop Tait set apart Miss Elizabeth Ferard as a deaconess, for the laying on of hands, and she became the first president of the London Deaconess Institution. Other dioceses gradually adopted the innovation. It has received the sanction of Convocation, and the Lambeth Conference in 1897 declared that it "recognized with thankfulness the revival of the office of deaconess," though at the same time it protested against the indiscriminate use of the title and laid it down emphatically that the name must be restricted to those who had been definitely set apart by the bishop for the position and were working under the direct supervision and control of the ecclesiastical authority in the parish.

In addition to Miss Robinson's book cited above, see *Church Quarterly Review*, xlvi. 302 ff., art. "On the Early History and Modern Revival of Deaconesses." (b) The name, in the sense referred to, is generally found in the following works: D. Latus, *Christliche *Aussichten*, ii. 163-171 (Athen, 1883); *Testamentum Dominii*, ed. Rahmani (Mainz, 1899); L. Zscharnack, *Der Dienst der Frau in den ersten Jahrhunderten der Kirche* (1902).

**DEAD SEA, a lake in Palestine occupying the deepest part of the valley running along the line of a great "fault" that has been traced from the Gulf of Akaba (at the head of the Red Sea) to Hermon. This fracture was caused after the end of the Eocene period by the earth-movement which resulted in the raising of the whole region out of the sea. Level for level, the more ancient rocks are on the eastward side of the lake: the cretaceous limestone that surmount the older volcanic substrata come down on the western side to the water's edge, while on the eastern side they are raised between 3000 and 4000 feet above it. In the Pleistocene period the whole of this depression was filled with water forming a lake about 200 m. long north to south, whose waters were about the same level as that of the Mediterranean Sea. With the diminishing rainfall and increased temperature that followed, that period the effects of evaporation gradually surpassed the precipitation, and the waters of the lake slowly diminished to about the extent which they still display. Its breadth is about 6 m., and its maximum breadth is about 8 m.; its area is about 340 sq. m. It lies nearly north and south. Its surface being 1280-1300 ft. below the level of the Mediterranean Sea, it has of course no outlet. It is bounded on the north by the broad valley of the Jordan; on the east by the rapidly rising terraces which culminate in the Moabite plateau, 3100 ft. above the level of the lake; on the south by the desert of the Arabah, which rises to the watershed between the Dead and the Red Sea—653 m. from the former, 46¾ from the latter; height 660 ft.—and on the west by the Judean mountains which attain a height of 3300 ft. On the east side a peninsula, El-Lisan ("the tongue"), of white calcareous marl with beds of salt and gypsum, divides the sea into two unequal parts: this peninsula is about 50 ft. high, and is connected by a narrow strip of marsh-land with the shore. Its northern and southern extremities have been named Cape Costigan and Cape Molyneux; in memory of two explorers who were among the first in modern times to navigate the sea and succumbed to the consequent fever and
exhaustion. North of the peninsula the lake has a maximum depth of 1298 ft.; south of it the water is nowhere more than 12 ft. and in some places only 3 ft. The surface level of the lake varies with the season, and recent observations taken on behalf of the Palestine Exploration Fund seem to show that there are probably cyclical variations also (ultimately dependent on the rainfall), the nature and periodicity of which there are as yet no sufficient data to determine. In 1858 there was a small island near the north end rising 10 or 12 ft. above the surface and connected with the shore by a causeway; this has been submerged since 1892; and owing to the gradual rise of level within these years the fords south of the Lisan, and the pathway which formerly rounded the Ras Feshkham, are now no longer passable.

The slopes on each side of the sea are furrowed with water-courses, some of them perennial, others winter torrents only. The chief affluent of the sea are as follows:—on the north, Jordan and ‘Ain es-Suweimeh; on the east Wadis Ghuweir, Zerka Ma’in (Callirrhoe), Möjib (Arnon), Ed-Dera’a, and el-Hesi; on the west, Wadis Muhawat and Seyal, ‘Ain Jidi (En-Gedi), Wadi el Merabah, ‘Ain Ghuweir, Wadi el-Nar, ‘Ain Feshkham. The quantity of water poured daily into the sea is not less than 6,000,000 tons, all of which has been carried off by evaporation. The consequence of the ancient evaporation, by which the great Pleistocene lake was reduced to its present modest dimensions, and of the ceaseless modern daily evaporation, is the impregnation of the waters of the lake with salts and other mineral substances to a remarkable degree. Ocean water contains on an average 4.6% of salts: Dead Sea water contains 25%. The following analysis, by Dr Bernays, gives the contents of the water more accurately:—

**Specific gravity 1.1528 at 15° C.**

The density of the water averages 1.166. It increases from north to south, and with the depth. The increase is at first rapid, then, after reaching a certain point, becomes more uniform. At 300 metres its density is 1.1925. The boiling point is 221°F. To the quantity of solid matter suspended in its water the Dead Sea owes, besides its saltiness, its buoyancy and its poisonous properties. The human body floats on the surface without exertion. Owing principally to the large proportion of chloride and bromide of magnesium no animal life can exist in its water. Fish, which abound in the Jordan and in the brackish spring-fed lagoons that exist in one or two places around its shores (such as ‘Ain Feshkham), die in a very short time if introduced into the main waters of the lake. The only animal life reported from the lake has been some tetanus and other bacilli said to have been found in its mud; but this discovery has not been confirmed. To the chloride of calcium is due the smooth and oily feeling of the water, and to the chloride of magnesium its disagreeable taste. In Roman times curative properties were ascribed to the waters: Mukaddasi (A.D. 985) asserts that people assembled to drink it on a feast day in August. The salt of the Dead Sea is collected and sold in Jerusalem; smuggling of salt (which in Turkey is a government monopoly) is a regular occupation of the Bedouin. The bitumen which floats to shore is also collected. The origin of this bitumen is disputed: it was supposed to be derived from subaqueous strata of bituminous marl and rose to the surface when loosened by earthquakes. It is, however, now more generally believed that it exists in the breccia of some of the valleys on the west side of the lake, which is washed into the sea and submerged, till the small stones by which it is sunk are loosened and fall out, when the bitumen rises to the surface.

**History.**—The earliest references to the sea or its basin are in the patriarchal narratives of Lot and Abraham, the most striking being the destruction of the neighbouring cities of Sodom and Gomorrah. (See Sodom.) The biblical name is the Salt Sea, the Sea of the Arabah (the south end of the Jordan valley), or the East Sea. The name in Josephus is Asphalities, referring to the bituminous deposits above alluded to. The modern name is Bahr Lüt or “Sea of Lot”—a name hardly to be explained as a survival of a vague tradition of the patriarch, but more probably due to the literary influences of the Hebrew Scriptures and the Koran filtering through to the modern inhabitants or their ancestors. The name Dead Sea first appears in late Greek writers, as Pausanias and Galen. At En-Gedi on its western bank David for a while took refuge. South of it is the stronghold of Masada, built by Jonathan Maccabaeus and fortified by Herod in 42 B.C., where the last stand of the Jews was made against the Romans after the fall of Jerusalem, and where the garrison, when the defences were breached, slew themselves rather than fall into Roman hands.

The sea has been but little navigated. Tacitus and Josephus mention boats on the lake, and boats are shown upon it in the Madaba mosaic. The navigation dues formed part of the revenue of the lords of Kerak under the crusaders. In modern times navigation is practically nil. The lake, with the whole Jericho plain, is claimed as the personal property of the sultan.

The medieval travellers brought home many strange legends of the sea and its peculiarities—some absurd, others with a basis of fact. The absence of sea-birds, due to the absence of fish, probably accounts for the story that no birds could fly over it. The absence of vegetation on its shores, due to the scanty rainfall and general want of fresh water—except in the neighbourhood of springs like ‘Ain Feshkham and ‘Ain Jidi, where a luxuriant subtropical vegetation is found—accounts for the story that no plant could live in the poisonous air which broods over the sea. The mists, due to the great heat and excessive evaporation, and the noxious miasmata, especially of the southern region, were exaggerated into the noisome vapours that the “black and stinking” waters ever exhaled. The judgment of Sodom and Gomorrah (with which of course they believed to be under the waters of the lake, in accordance with the ancient belief first found in Josephus and still often repeated) blinded these good pilgrims to the ever-fresh beauty of this most lovely lake, whose blue and sparkling waters lie deep between rocks and precipices of unsurpassable grandeur. The play of brilliant colours and of ever-changing contrasts of light and shade on those rugged mountain-sides and on the surface of the sea itself might have been expected to appeal to the most prosaic. The surface of the sea is generally smooth (seldom, however, absolutely inert as the pilgrims represented it), but is frequently raised by the north winds into waves, which, owing to the weight and density of the water, are often of great force.

The first to navigate the sea in modern times was an Irish traveller, Costigan by name, in August and September 1835. Owing largely to the folly of his Greek servant, who, without his master’s knowledge, threw overboard the drinking-water to light a fire on board the boat, the explorer after circumnavigating the sea reached Jericho in an exhausted condition, and was there attacked by a severe fever. The greatest difficulty was experienced in obtaining assistance for him, but he was ultimately conveyed on camel-back to Jerusalem, where he died; his grave is in the Franciscan cemetery there. His fate was shared by his successor, a British naval officer, Lieutenant Molyneux (1847), whose party was attacked and robbed by Beduins. W. F. Lynch, an American explorer (1848), equipped by the United States government, was more successful, and he may claim to be the first who examined its shores and sounded its depths. Since his time the duc de Luynes, Lartet, Wilson, Hull, Blanckenhorn, Gautier, Libby, Masterman and Schmidt, to name but a few, have made contributions to our knowledge of this lake; but still many problems present themselves for solution. Among these may be mentioned...
(1) the explanation of a remarkable line of white foam that extends along the axis of the lake almost every morning—supposed by Blanckenberg to mark the line of a fissure, thermal and asphaltic, under the bed of the lake, but otherwise explained as a consequence of the current of the Jordan, which is not completely expended till it reaches the Lián, or as a result of the mingling of the salt water with the brackish spring water especially along the western shore; (2) a northward current that has been observed along the east coast; (3) various disturbances of level, due possibly to differences of barometric pressure; (4) some apparently electrical phenomena that have been observed in the valley. Before we can be said to know all that we might regarding this most interesting of lakes further extensive scientific observations are necessary; but these are extremely difficult owing to the impossibility of maintaining self-registering instruments in a region practically closed to Europeans for nearly half the year by the stifling heat, and inhabited only by Bedouins, who are the worst kind of ignorant, thievish and mischievous savages.

(R. A. S. M.)

DEADWOOD, a city and the county-seat of Lawrence county, South Dakota, U.S.A., about 180 m. W. of Pierre. Pop. (1890) 2366; (1900) 3498, of whom 707 were foreign-born; (1910) 4364; (1920) 5653. It is served by the Chicago, Burlington & Quincy and the Chicago & North-West road, and by the Northern Pacific. The town is built on the banks of Whitewood Creek at an elevation of 4550 ft. Deadwood is the commercial centre of the Black Hills. About it are several gold mines (including the well-known Home-stake mine), characterized by the low grade of their ores (which range from $2 to $8 per ton), by their vast quantity, and by the ease of mining and of extracting the metal. The ore contains free gold, which is extracted by the simple process of stamping and amalgamation, and refractory values, extracted by the cyaniding process. Several hundred tons of ore are treated thus in Deadwood and its environs daily, and its stamp mills are exceeded in size only by those of the Treadwell mine in S.E. Alaska, and by those on the Rand in South Africa. The discovery of gold here was made known in June 1875, and in February 1877 the United States government, after having purchased the land from the Sioux Indians, opened the place for legal settlement.

DEAF AND DUMB. The term "deaf" is frequently applied to those who are deficient in hearing power in any degree, however slight, as well as to people who are unable to detect the loudest sounds by means of the auditory organs. It is impossible to draw a hard and fast line between the hearing and the deaf and the hearing at any degree of intergradation. For the purposes of this article, however, that denotation which is generally accepted by educators of the deaf may be given to the term. This makes it refer to those who are so far handicapped as to be incapable of instruction by the ordinary means of the ear in a class of those possessing normal hearing. Paradoxical though it may seem, it is yet true to say that "dumbness" in our sense of the word does not, strictly speaking, exist, though the term "dumb" may, for all practical purposes, fairly be applied to many of the deaf even after they are supposed to have learnt how to speak. Oral teachers now confess that it is not worth while to try to teach more than a large percentage of the deaf to speak at all. We are not concerned with aphasias, stammering or such inability to articulate as may be due to malformation of the vocal organs. In the case of the deaf and dumb, as these words are generally understood, dumbness is merely the result of ignorance in the use of the voice, this ignorance being due to the deafness. The vocal organs are perfect. The deaf man can laugh, shout, and in fact utter any and every sound that the normal person can. But he does not speak English (if that happens to be his nationality) for the same reason that a French child does not, which is that he has never heard it. There is in fact no more a priori reason why an English baby, born in England, should learn English than that it should talk any other language. English may be correctly described as its "mother tongue," but not its natural language; the only reason why one person speaks English and another Russian is that each imitated that particular language which he heard in infancy. This imitation depends upon the ability to hear. Hence if one has never heard, or has lost hearing in early childhood, he has never been able to imitate that language which his parents and others used, and the condition of so-called dumbness is added to his deafness. From this it follows that if the sense of hearing be not lost till the child has learnt to speak fluently, the ability to speak is unaffected by the calamity of deafness, except that after many years the voice is likely to become high-pitched, or too guttural, or peculiar in some other respect, owing to the absence of the control usually exercised by the ear. It also follows that, to a certain extent, the art of speech can be taught the deaf person even though he were born deaf. Theoretically, he is capable of talking just as well as his hearing brother, for the organs of speech are as perfect in one as in the other, except that they suffer from lack of exercise in the case of the deaf man. Practically, he can never speak perfectly, for even if he were made to attempt articulation as soon as he is discovered to be deaf, the fact that the ear, the natural guide of the voice, is useless, lays upon him a handicap which can never be wiped out. He can only speak so well as his hearing brother's voice nor of his own; he can only see small and, in many instances, scarcely discernible movements of the lips, tongue, nose, cheeks and throat in those who are endeavouring to teach him to speak, and he can never hope to succeed in speech through the instrumentality of such unsatisfactory appeals to his eye as perfectly as the hearing child can with the ideal adaptation of the voice to the ear. Sound appeals to the ear, not the eye, and those who have to rely upon the latter to imitate speech must suffer by comparison.

Deafness then, in our sense, means the incapacity to be instructed by means of the ear in the normal way, and dumbness means only that ignorance of how to speak one's mother tongue which is the effect of the deafness.

Of such deaf people many can sound to some extent. Dr. Kerr Love quotes several authorities (Deaf Mutism, pp. 58 ff.) to show that 50 or 60% are absolutely deaf, while 25% can detect loud sounds such as shouting close to the ear, and the rest can distinguish voices or even words. He himself thinks that not more than 15 or 20% are totally deaf—sometimes only 7 or 8%: that ability to hear speech exists in about one in four, while ten or fifteen in each hundred are only semi-deaf. He gives as an illustration of the latter's voice nor of his own; he can only see small and, in many instances, scarcely discernible movements of the lips, tongue, nose, cheeks and throat in those who are endeavouring to teach him to speak, and he can never hope to succeed in speech through the instrumentality of such unsatisfactory appeals to his eye as perfectly as the hearing child can with the ideal adaptation of the voice to the ear. Sound appeals to the ear, not the eye, and those who have to rely upon the latter to imitate speech must suffer by comparison.

Deafness then, in our sense, means the incapacity to be instructed by means of the ear in the normal way, and dumbness means only that ignorance of how to speak one's mother tongue which is the effect of the deafness.

Of such deaf people many can sound to some extent. Dr. Kerr Love quotes several authorities (Deaf Mutism, pp. 58 ff.) to show that 50 or 60% are absolutely deaf, while 25% can detect loud sounds such as shouting close to the ear, and the rest can distinguish voices or even words. He himself thinks that not more than 15 or 20% are totally deaf—sometimes only 7 or 8%: that ability to hear speech exists in about one in four, while ten or fifteen in each hundred are only semi-deaf. He gives as an illustration of the latter's voice nor of his own; he can only see small and, in many instances, scarcely discernible movements of the lips, tongue, nose, cheeks and throat in those who are endeavouring to teach him to speak, and he can never hope to succeed in speech through the instrumentality of such unsatisfactory appeals to his eye as perfectly as the hearing child can with the ideal adaptation of the voice to the ear. Sound appeals to the ear, not the eye, and those who have to rely upon the latter to imitate speech must suffer by comparison.

Deafness then, in our sense, means the incapacity to be instructed by means of the ear in the normal way, and dumbness means only that ignorance of how to speak one's mother tongue which is the effect of the deafness.
in fact, a general incapacity of the whole body and senses. It is incorrect to designate such persons as deaf and feeble-minded or deaf and idiotic, because in many cases their organs of hearing are as perfect as are other organs of their body, and they are no more deaf than blind, though they may pay no attention to what they hear any more than to what they see. They are simply weak in intellect, and this is shown by the disuse of any and all of their senses; hence it is incorrect to classify them according to one, and one only, of the evidences of this mental weakness.

*Extent of Deafness.*—The following table shows the number of deaf and dumb persons in the United Kingdom at successive censuses:

<table>
<thead>
<tr>
<th>YEAR</th>
<th>Number of Deaf and Dumb Persons</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>United Kingdom</td>
</tr>
<tr>
<td>1851</td>
<td>17,649</td>
</tr>
<tr>
<td>1861</td>
<td>20,224</td>
</tr>
<tr>
<td>1871</td>
<td>19,159</td>
</tr>
<tr>
<td>1881</td>
<td>20,573</td>
</tr>
<tr>
<td>1891</td>
<td>20,781</td>
</tr>
<tr>
<td>1901</td>
<td>21,585</td>
</tr>
</tbody>
</table>

From this we find that the proportion of deaf and dumb to the population has been as follows:

<table>
<thead>
<tr>
<th>YEAR</th>
<th>Proportion of Deaf and Dumb to the Population</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>United Kingdom</td>
</tr>
<tr>
<td>1851</td>

<td>1 in 1054</td>
</tr>
<tr>
<td>1891</td>
<td>1 in 1014</td>
</tr>
<tr>
<td>1901</td>
<td>1 in 1087</td>
</tr>
</tbody>
</table>

There has, therefore, been on the whole a steady decrease of those described as "deaf and dumb" in proportion to the population in Great Britain and Ireland. But in the census for 1901, in addition to the 15,246 returned as "deaf and dumb" in England and Wales, 18,507 were entered as being "deaf," 2,433 of whom were described as having "deaf from childhood."

Mr B. H. Payne, the principal of the Royal Cambrian Institution, Swansea, makes the following remarks upon these figures:—

"Of the general conclusion of course is that there has been a large increase, relative as well as absolute, of the class in which we are interested, which we call the deaf, and which includes the deaf and dumb. Indeed, the number, large as it is, cannot be considered as complete, as the schedules did not require persons who were only deaf to state their infirmity, and, though many did so, it may be presumed that more did not.

"On the other hand, circumstances exist which may reasonably be held to modify the conclusion that there has been a large relative increase of the deaf. The spread of education, the development of local government, and an improved system of registration, may have had the effect of procuring fuller enumeration and more appropriate classification than heretofore, while 13,686 persons described simply as dumb, and who therefore probably belong, not to the deaf, but to the feeble-minded and aphasic classes, are included in the "deaf and dumb" total. It is also to be noted that some of those who have described themselves as 'deaf' though not born so may have been educated in the ordinary way before they lost their hearing, and are therefore outside the sphere of the operation of schools for the deaf.

"In connexion with the census of 1891, it has been remarked in the report of the institution that no provision was made in the schedules for distinguishing the congenital from the non-congenital deaf, and that it was desirable to draw such a distinction. To ascertain the relative increase or decrease of one or the other section of the class would contribute to our knowledge of the incidence of known causes of deafness or to the confirmation or discovery of other causes, and so far indicate the appropriate measures of prevention, while such an inquiry as that recommended has, besides, a certain bearing upon educational views.

"The exact number of 'deaf and dumb' and 'deaf' children who are of school age cannot be ascertained from the census tables, which give the numbers in quinquennial age-groups, while the school age is seven to sixteen. It is a pity that in this respect the functions of the census department are not co-ordinated with those of the Board of Education."

Dr. John Hitz, the superintendent of the Volta Bureau for the Increase of Knowledge Relating to the Deaf, Washington, D. C., U.S.A., gives the number of schools for deaf children, and pupils, in different countries in 1910 as follows:

<table>

1 Incomplete.
Other statistics vary very much as to the proportion of born deaf, some being as low as a quarter, and some as high as three-quarters, of the whole class. We can only say, speaking of both sides of the Atlantic, and countering one period with another, that the general average appears to be about 50% for each. Probably the percentage varies in different places for definite reasons, which we shall now briefly consider.

_Causes of Deafness._—These may be considered in two divisions, pre-natal and post-natal.

1. _Pre-Natal._—A small percentage of these is due, it seems, to malformation of some of the auditory apparatus. Another percentage is known to represent the children of the intermarriage of blood relations. *Dr Kerr Love (Deaf Mutism, p. 117)* gives statistics from thirteen British institutions which show that on a general average at least 8% of the congenitally deaf are the offspring of such marriages. Besides this, little is known of other words, the deafness in any percentage of deaf children are the offspring of marriages in which one or both partners were born deaf than of ordinary marriages. But inquiries into such phenomena have generally been directed towards tracing deafness and not consanguinity, or at least the inquirer has rarely trouble to make sure whether the grandparents or great-grandparents on either side were relations or not. Such investigations rarely go beyond ascertaining if the parents were related to each other, though we have proof that a certain tendency towards any particular abnormality may not exhibit itself in every generation of the family in question. To give an illustration, suppose that G is a deaf man. Several inquirers may trace back to the preceding generation F, and to the grandparent E, and even to the great-grandparents D, in search of an ancestor who is deaf, and such they may discover in the third generation D*: But probably not one of these several inquirers will ask G if any of his grandparents or great-grandparents married a cousin, for instance, though they may ask if his father did. To continue this hypothetical case, the investigator will again trace back along the family tree to generations C, B, and A in search of an original deaf ancestor, on whose shoulders they seek to lay the blame of both D's and G's deafness. Not finding any such, they will again content themselves with asking if D's parents (generation C) were blood relations or not, and, receiving an answer in the negative, desist from further inquiry in this direction, assuming that D's deafness is the original cause of G's deafness. They do not, we fear, inquire if any grandparents or great-grandparents (hearing people) were related, with the same persistency as they ask if any were deaf. The search for deafness is pushed through several generations, the search for consanguinity is only extended to one generation. Perhaps if it were carried further, it would be discovered that A married his niece, and there lay the secret of the deafness in both D and G. Of other words, the deafness in the cause of that in G, but the deafness in both D and G are effects of the consanguineous marriage in A. All this is, however, merely by way of suggestion. We submit that if deafness in one generation may be followed by deafness two or even three generations later, while the tendency to deafness exists, but does not appear, in the intermediate generations, it is only logical to inquire if deafness in the first discoverable instance in a family may not be caused by consanguinity, the effect of which is not seen for two or three generations in a similar manner. Moreover it is probable that consanguinity in parents or grandparents may often be denied. An exhaustive investigation along these lines is desirable, for we believe that congenital deafness would be proved to be due to consanguinity in hearing people, if the search were pushed far enough back and the truth were told, in a far greater percentage of cases than is now suspected. This is not disproved by quoting numbers of cases where no deafness follows consanguinity in any generation, for resultant weakness may be shown (where it exists) in many other ways than by deafness.

This theory receives support from the statistics quoted by Dr Kerr Love (Deaf Mutism, p. 133), where the percentage of defective children resulting from the consanguineous marriages of hearing people increases in almost exact proportion to the nearness of affinity of the parents. It is further borne out by

---

[1] The figures for England, Scotland, and Ireland, according to the 1901 census, are different and have been given above.
One point deserves special attention in the above list. It is that where there are no deaf relatives (i.e. where there has not been a history of deafness in the family) only one child out of twenty-four is deaf, even when the parents were both born deaf themselves. In marriages between deaf relatives, and where relatives by both sides, and the parents were born deaf, the percentage of deaf children is seven and a half times as great. This seems to show that there are causes of congenital deafness which are, comparatively speaking, unlikely to be transmitted to future generations while the other causes of congenital deafness are so liable to be perpetuated that one child in every three is deaf. We conjecture that one original cause of congenital deafness which reappears in a family is consanguinity—for instance, the intermarriage of first or second cousins (hearing people) in some previous generation. Out of the 2245 deaf persons who were born deaf, 269 had parents who were blood relations, according to Fay. And perhaps many more refrained from acknowledging the fact. Eleven had grandparents who were cousins. This theory calls for investigation, and while the marriage of deaf people is not encouraged, it is fair to ask those who so strenuously oppose such unions whether they may not be spending their energies on trying to check an effect instead of a cause, and if that cause may not really be consanguinity,—witness the percentage of deaf people among Roman Catholics, Protestants and Jews before noticed. On the principle that prevention is better than cure it is the intermarriage of cousins and other relations which should be discouraged. The marriage of deaf people is disadvantageous where there has been deafness in the family in former generations, but the same warning applies to all other members of that family, for the hearing members are all liable to transmit the defect of deafness to their children as the deaf members are. We are more concerned to discover the primary cause of the defect, and take steps to prevent the latter from occurring at all. Those who have no dissuasions for hearing people, who might perhaps cause the misery, and only give counsel to those among the transmitters of it who happen to be deaf, are acting in a manner which is hardly logical.

2. Post-Natal.—We have collected and grouped the stated causes of deafness in those partners of the marriages in America noticed by Fay. About a hundred and thirty did not mention how they lost hearing. Any errors in this calculation must be less than 1% at most, and can make no material difference. In some cases two or more diseases are given as the cause of deafness. In such cases where one is a very common cause of deafness, and the other is unusual, the former is credited with being the reason for the defect. Where both are common, we have divided the cases between them in a rough proportion.

There appears to be no cure for deafness that is other than partial; but with the advance of science preventive treatment is expected to be efficacious in scarlet fever, measles, &c.

Condition of the Deaf.

1. In Childhood.—It is difficult to impress people with two facts in connexion with teaching language to the average child who was born deaf, or lost hearing in early infancy. One is the necessity of the undertaking, and the other is that this necessity is not due to mental deficiency in the pupil. To the born deaf-mute in an English-speaking country English is a foreign language. His inability to speak is due to his never having heard that tongue which his mother uses. The same reason holds good for his entire ignorance of that language. The hearing child does not know a word of English when he is born, and never would learn it if taken away from where it is spoken. He learns English unconsciously by imitating what he hears. The deaf child never hears English, and so he never learns it till he goes to school. Here he has to start learning English—or whatever is the language of his native land—in the same way as a hearing boy learns a foreign language.

But another reason exists which renders his task much more difficult than that of a normal English schoolboy learning, say, German. The latter has two channels of information, the eye and the ear; the deaf boy has only one, the eye. The hearing boy learns German by what he hears of it in class as well as by reading it; the deaf boy can only learn by what he sees. It is as if you tried to fill two cisterns of the same capacity with two inlets to one and only one inlet to the other; suppose the inlets to be the same size, the former will fill twice as fast. So it is in the case of the hearing boy as compared with his deaf brother. The cerebral capacity and quality are the same, but in one case one of the avenues to the brain is closed, and consequently the development is less rapid. Moreover, the thoughts are precisely those which would be expected in people who form them only from what they see. We were often asked by our deaf playmates in our childhood such questions (in signs) as "What does the cat say?"—"The dog talks, does he not?"—"Is the rainbow very hot on the roof of that house?" They have often told us such things as that they used to think someone went to the end of the earth and climbed up the sky to light the stars, and to pour down rain through a sieve.

But there is yet a third disadvantage for the already handicapped deaf boy. He has no other language to build upon, while the other has his mother tongue with which to compare the foreign language he is learning. The latter already has a general idea of sentences and clauses, of tense and mood, of gender, number and case, of substantives, verbs and prepositions, and he knows that the language must form something to parallel to another. He is already prepared to find a subject, predicate, and object, in the sentence of a foreign language, even when he knows not a word of any but his own mother tongue. If he is told that a certain word in German is an adjective, he understands what its function is, even when he has yet to learn the meaning of the word. All this goes for nothing in the case of the deaf pupil. The very elementary fact that certain words denote certain objects—that there is such a class of word as substantives—comes as a revelation to most deaf children. They have to begin at seven laboriously and artificially to learn what an ordinary baby has unconsciously and naturally discovered at the age of two. English, spoken, written, printed or finger-spelled, is no more natural, comprehensive or easy of acquisition to the deaf than is Chinese. The manuel alphabet is simply one way of expressing the vernacular on the fingers; it is no more the deaf-mute's "natural" language than speech or writing, and if he cannot express himself by the latter modes of communicating, he cannot by spelling on the fingers. The last is simply a case of sounding words, and there are languages in themselves; whether you use pen or type, hand or voice, you are but adopting one or other method of expressing one and the same tongue—English or whatever it may be, that of a "people of a strange speech and of a hard language, whose words they cannot understand." The deaf child's natural mode of communication—more natural to him than any verbal language is to hearing people—is the world-wide, natural language of signs.

2. Natural Language of the Deaf.—We have just called signs a natural language. While a purist might properly object to this adjective being applied to all signs, yet it is not an unfair term to use as regards this method of conversing as a whole, even in the United States, where signs, being to a great extent the French signs invented by de l'Épée, are more artificial than in England. The old story, by the way, of the pupil of de l'Épée failing to write more than "hand, breast," as describing what an incredulous investigator did when he laid his hand on his breast, proves nothing. In all probability he had no idea that he was expected to describe an action, and thought that he was being asked the names of certain parts of the body. The hand was held out to him and he wrote "hand." Then the breast was indicated by placing the hand on it, and he wrote "breast." Moreover, the artificial element is much less pronounced than is supposed by most of those who are loudest in their condemnation of signs, there being almost invariably an obvious connexion between the sign and idea. These critics are generally people whose acquaintance with the subject is rather limited, and the thermometer of whose zeal in waging war against gestures generally falls in proportion as the photometer of their knowledge about them shows an increasing light. We may go still further and point out that to object to any sign on the ground of artificiality per se, is to strain at the gnats and to swallow the camel, for English itself is one of the most artificial languages in existence, and certainly is more open to such an objection than signs. If we apply the same test to English that is applied to signs by those who would rule out any which they suppose cannot come under the head of natural gesture or pantomime, what fraction of our so-called natural gestures do we have left? For a spoken word to be "natural" in this sense it must be onomatopoeiac, and what infinitesimal percentage of English words are such? A foreigner, unacquainted with the language, could not glean the drift of a conversation in English, except perhaps a trifle from the tone of the voices and more from the natural signs used—the smiles and frowns, the expressions of the faces, the play of eyes, lips, hands and whole body. The only words he could possibly understand without such aids are some such onomatopoeiac words as the cries of animals—"mew," "chirrup," &c, and a few more like "bang" or "swish."

The reason why we insist emphatically upon the importance of teaching English in schools for the deaf in English-speaking countries, is, firstly, because that is the language which the pupil will be called upon to use in his intercourse with his fellow-men.
as he does so express himself, whether by speech or writing, or finger-spelling—for if he can finger-spell he can write. It is not the mere fact that he can make certain sounds or write certain letters or form the alphabet on his hands that should signify. It is the actual language that he uses, whatever be the means, and the thoughts that are enshrined in the language, that should be our criteria when judging of his education.

The importance of English is insisted upon because to place the deaf child in touch with his English-speaking fellow-men we must teach him their language, and also because he can thereby educate himself by means of books if, and when, he has a sufficient command of that language. The reason is not because the vernacular is actually superior to signs as a means of conversation. The sign language is quite equal to the vernacular as a means of expression. The former is as much our mother tongue, if we may say so, as the latter; we used one language as soon as the other, in our earliest infancy; and, after a lifelong experience of both, we affirm that signs are a more beautiful language than English, and provide possibilities of a wealth of expression which English does not possess, and which probably no other language possesses.

That others whose knowledge of signs is lifelong hold similar opinions is shown by the following extract from *The Deaf and Their Possibilities*, by Dr Gallaudet:

"Thinking that the question may arise in the minds of some, 'Does the sign language give the deaf, when used in public addresses, all that speech affords to the hearing?' I will say that my experience and observation lead me to answer with a decided affirmative. On occasions almost without number it has been my privilege to interpret, through signs to the deaf, addresses given in speech; I have addressed hundreds of assemblages of deaf persons in the college, in schools I have visited, and elsewhere, using signs for the original expression of thought; I have seen many more lectures and public debates given originally in signs; I have seen conventions of deaf-mutes in which no word was spoken, and yet all the forms of parliamentary proceedings were observed, and the most earnest, and even excited discourses were carried on. I have seen the ordinances of religion administered, and the full service of the Church rendered in signs; and all this with the assurance growing out of my complete understanding of the language—a knowledge which dates from my earliest childhood—that for all the purposes enumerated gestural expression is in no respect inferior, and in many respects superior, to oral, verbal utterance as a means of communicating ideas."

The following is an analysis of the sign language given by Mr Payne of the Swasea Institution, together with his explanatory notes:

"**Analysis of the Sign Language.**

I. Facial expression.
   1. Sympathetic
   2. Representative (= Natural signs)
   3. Systematic (Arbitrary signs)
      a. Grammatical signs
II. Gestural
III. Mimic action.
IV. Pantomime.

---

**Fig. 1.**

Units are signified with the palm turned inwards; tens with the palm turned outwards; hundreds with the fingers downwards; thousands with the left hand to the right shoulder; millions with the hand near the forehead. For 12, sign to 10 outwards and 2 inwards, and so on up to 19. 21 = 2 outwards, 1 inwards, and so on up to 30. 146 = 1 downwards, 4 outwards, 6 inwards. 258 = 2 downwards, 5 outwards, 8 inwards, 7 inwards (both at shoulder), 8 downwards, 3 outwards, 7 inwards. 506, 126, 345 = 5 downwards, 9 outwards, 9 inwards (all near forehead); 1 downwards, 2 inwards, 6 inwards (all at shoulder); 3 downwards, 4 outwards, 5 inwards (in front of chest).

Only the third, and a few of the second, subdivision of the second section of the above classes of signs can be excused when talking of signs as being the deaf-mute's natural language. In fact we hesitate to call representative gesture—e.g., the horns and action of milking for "cow," the smugging of something grasped in the hand for "flower," &c.—conventional at all, except when shortened as the usual sign for "cat." It is, for instance, from the sign for whiskers plus stroking the fur back and tail plus the action of a cat licking its paw and washing its face, to the sign for whiskers only.

The deaf child expresses himself in the sign language of his own accord. The supposition that in manual or combined schools generally they "teach them signs" is incorrect, except that perhaps occasionally a few pupils may be drilled and their signs polished for a dramatic rendering of a poem at a prize distribution or public meeting, which is no more than teaching them signs than training hearing children to recite the same poem orally and polishing their rendering of it is teaching them English. If the deaf boy meets with some one who will use gesture to him, a new sign will be invented as occasion requires by one or other to express a new idea, and if it be a good one it is tacitly adopted to express that idea, and so an entire language is built up. It follows that in different localities signs will differ to a great extent, but one who is accustomed to signing can readily see the connexion and understand what is meant even when the signs are partly novel to him. We are sometimes asked if we can make a deaf child understand abstract ideas by this language. Our answer is that we can, if a hearing child of no greater age and intelligence can understand the same ideas in English. Signs are, though other numerals and symbols may be the best means of conveying religious truths to the deaf. If you wish to impress on him, to impress him, to reach his heart and his sympathies (and, incidentally, to offer the best possible substitute for music), use his own eloquent language of signs. We have conversed with signs deaf people from all parts of the British Isles, from France, Norway and Sweden, Poland, Finland, Italy, Russia, Turkey, the United States, and found that they are indeed a world-wide means of communication.
886 DEAF AND DUMB

even when we wandered on to most unusual and abstract subjects. Deaf people in America converse with Red Indians with ease thereby, which shows how natural the generality of even de l'Epée's signs are. The sign language is everybody's natural language, not only the deaf-mute's.

Addison (Def Mutism, p. 283) quotes John Bulwer as follows:

"What though you (the deaf and dumb) cannot express your minds in those verbal contrivances of man's invention: yet you want not speech, since you have a language for thought, which is more natural and significant, which is common to you with us, to wit, gesture, the general and universal language of human nature. The same writer says further on (p. 297): 'The same power of intuition which gives the signs of the deaf and dumb as with the spoken words of the hearing. Arnold, than whom no stronger advocate of the oral method exists, recognizes this in his comment on this principle of the German school, for he writes: 'It is more likely that teachers should indulge less unconfined assertions of the impossibility of deaf-mutes attaining to clear conceptions and abstract thinking by signs or mimic gestures. Facts are against them.' Again, Graham Bell, who is generally considered an opponent of the sign system, says, 'I think that if we have the mental condition of the child alone in view without reference to language, no language will reach the mind like the language of signs: it is the method of reaching the mind of the deaf child.'

The opinions of the deaf themselves, from all parts of the world, are useful testimony on the question. In the words of Dr Smith, president of the World's Congress of the Deaf held at St Louis, Missouri, in 1904, under the auspices of the National Association of the Deaf, U.S.A., 'the educated deaf have a right to be heard in their own defense. They have been heard. A portrait may be quoted of the resolutions passed at that congress of 570 of the best-informed deaf the world has ever seen, at least scores, if not hundreds, of holding degrees, and being as well educated as the vast majority of the deaf in England.' Resolved, that the oral method, which withholds from the congenitally and quasi-congenitally deaf the use of the language of signs outside the schoolroom, robs the children of their birthright; that those champions of the oral method, who have been carrying on a warfare, both verbal and covert, against the use of the language of signs by the adult deaf, are not friends of the deaf; and that, in our opinion, it is the duty of every teacher of the deaf, no matter what method he or she uses, to have a working command of the sign language.

It is often urged as an objection to the use of signs that those who use them think in them, and that their English (or other verbal language) suffers in consequence. There is, however, no more objection to thinking in signs than to thinking in any other language, and as to the second objection, facts are against such a statement. The best-educated deaf in the world, as a class, are in America, and the American deaf sign almost to a man. It is true that at first a beginner in school may, when at a loss to express himself in words, render his thoughts in sign-English, if we may use the expression, just as a schoolboy will sometimes put Latin words in the English order. That is, the deaf pupil puts the words in the natural order of the signs, which is really the logical order, and is much nearer the Latin sequence of words than the English. But, firstly, if he had always been forbidden to use signs he would not express himself in English any better in that particular instance; he would simply not attempt to express himself at all,—so he loses nothing, at least; and, secondly, it is perfectly easy to teach him in a very short time that each language has its own idiom and that the thought is expressed in a different order in each.

On the other hand, objection nothing more need be said than that it is at first exactly that of his hearing brother, and his development therein depends entirely upon whether he is trained to the same degree. The need of this is great. He is quite as capable of religious and moral instruction, and benefits as much by what he receives of it. Happiness is a noticeable feature of the character of the deaf when they are allowed to mix with each other. The charge of bad temper can usually be sustained only when the fault is on the side of those with whom they live. For instance, the latter often talk in the presence of the deaf person without saying a word to him, and if he then shows irritation, which is not often in any case, it is no more to be wondered at than if a hearing person resents whispering or other secret communication in his presence.

3. Social Status, &c.—From the 1901 census "Summary Tables" we gather the following facts concerning the occupations of the deaf, aged ten and upwards, in England and Wales.

About half of the total number, taking males and females together (13,450), are engaged in occupations—6665. The rest—6785—are retired or occupied. Of the former, the following table gives below shows the distribution:

Total 6665

Among those in professional occupations are a clergymen, five law clerks, ten schoolmasters, teachers, &c., thirty-seven painters, engravers and sculptors, and seven photographers. Of those not engaged in occupations, 235 have retired from business, and 245 are living on their own means. Probably a very large number of the remainder were out of work or engaged in odd jobs at the time of the census; it would certainly be incorrect to take the words "Without specified occupations or unoccupied" to mean that those classified as such were permanently unable to support themselves.

The commonest occupations of men are bootmaking (555), tailoring (429), farm-labouring (287), general labouring (295), cabinet-making (142), painting, decorating and glazing (95), French-polishing (88), harness-making, &c. (80).

The commonest occupations of women are dressmaking (484), domestic service (367), laundry and washing service (230), tailoring (170), shirtmaking, &c. (81), charing (79).

In Munich there are about sixty deaf artists, especially painters and sculptors. In Germany and Austria generally, deaf lithographers, medallists, and photographers are well employed, as are book-binders in Leipzig in particular, and labourers in the provinces.

In France there are several deaf writers, journalists, &c., two principals of schools, an architect, a score or so of painters, several of whom are ladies, nine sculptors, and a few engravers, photographers, proof-readers, &c.

Italy boasts deaf wood-carvers, sculptors, painters, and architects graduating from the universities and academies of fine arts with gold medals; two engravers, type-setters, pressmen, carvers of cornal, ivory and precious stones.

Two gentle men in the office of the Norwegian government are deaf, as are four in the engraving department of the land survey; one is a deaf photographer, another is a third a civil engineer, and the rest are engaged in the usual trades, as are those in Sweden.

The deaf form societies of their own to guard their interests, for social intercourse and other purposes. In England there is the British Deaf and Dumb Association; in America the National Association of the Deaf and many lesser societies; Germany has no fewer than 150 such associations, some of which are athletic clubs, benefit societies, dramatic clubs, and so forth. The central Federation is the largest German association.

France has the National Union of Deaf-Mutes and others, many being benefit clubs. Italy has some societies; Sweden has eight.

In the United States there are no fewer than fifty-three publications devoted to the interests of the deaf, most of them being school magazines published in the institutions themselves. Great Britain and Ireland have six, four of them being school magazines. France, Germany, Sweden, Hungary have several,
and Finland, Russia, Norway, Denmark and Austria are represented. Canada has three.

There are many Church and other missions to the deaf in England and abroad, which are much needed owing to the difficulty the average deaf person has in understanding the archaic language of both Bible and Prayer-book. Until they have explained to them it is useless to place these books in their hands, and even where they are well-educated and can follow the services, they fail to get the sermon. Chaplains and missionaries engage in all branches of pastoral work among them, and also try to find them employment, interpret for them where necessary, and interview people on their behalf. The difficulty of obtaining employment for the deaf has been increased in Great Britain by the Employers' Liability and Workmen's Compensation Acts, for masters are afraid—needlessly, as facts show—to employ them, under the impression that they are more liable to accidents owing to their affliction.

The new After-Care Committees of the London County Council are a lamentation of a need which other bodies have long endeavoured to supply. Education should be a development of the whole nature of the child. The board of education in England provides for intellectual, industrial and physical training, but does not take cognizance of those parts of education which are far more important—the social, moral and spiritual. Some teachers, both oral and manual, do an incalculable amount of good at the cost of great self-sacrifice and in face of much discouragement. They deserve the highest praise for so doing, and such work needs to be carried on after their pupils leave school.

**Education.**

*History.*—"Who hath made man's mouth? or who maketh a man dumb, or deaf, or seeing, or blind? Is it not I the Lord?" (Ex. iv. 11). Such is the first known reference to the deaf. But the significance of this statement was not realized by the ancients, who mercilessly destroyed all the defective, the deaf among the rest. Greek and Roman custom demanded their death, and they were thrown into the river, or otherwise killed, without causing any comment but that so many encumbrances had been removed. They were regarded as being on a mental level with idiots and utterly incapable of helping themselves. In later times Roman law forbade those who were deaf and dumb from birth to make a will or bequest, placing them under the care of guardians who were responsible for them to the state; though if a deaf person had lost hearing after having been educated, and could either speak or write, he retained his rights. Herodotus refers to a deaf son of Croesus, whom he declares to have suddenly recovered his speech upon seeing his father about to be killed. Gallius makes a similar statement with reference to a certain athlete. Hippocrates was in advance of Aristotle when he realized that deaf-mutes did not speak simply because they did not know how to; for the last-named seems to have considered that some defect of the intellect was the cause of their inability to utter articulate sounds. Pliny the elder and Messalla Corvinus mention deaf-mutes who could paint. The true mental condition of the deaf was realized, however, by few, if any, before the time of Christ. He, as He opened the ears of the deaf man and loosened his tongue, talked to him in his own language, the language of signs.

St Augustine erred amazingly when he declared that the deaf could have no faith, since "faith comes by hearing only." The Talmud, on the other hand, recognized that they could be taught, and were therefore not idiotic.

It is, however, with those who attempted to educate the deaf that we are here chiefly concerned. The first to call for notice is St John of Beverley. The Venerable Bede tells how this bishop made a mute speak and was credited with having performed a miracle in so doing. Probably it was nothing more than the first attempt to teach by the oral method, and the greatest credit is due to him for being so far in advance of his times as to try to instruct his pupil at all. Bede himself invented a system of counting on the hands; and also a "manual speech," as he called it,—using his numerals to indicate the number of the letter of the alphabet; thus, the sign for "seven" would also signify the letter "g," and so forth. But we do not know that he intended this alphabet for the use of the deaf.

It is not until the 16th century that we hear much of anybody else who was interested in the deaf, but at this date we find Girolamo Cardan stating that they can be instructed by writing, after they have been shown the signification of words, since their mental power is unaffected by their inability to hear.

Pedro Ponce de Leon (c. 1520-1584), a Spanish Benedictine monk, is more worthy of notice, as he, to use his own words, taught the deaf "to speak, read, write, reckon, pray, serve at the altar, know Christian doctrine, and confess with a loud voice." Some he taught languages and science. That he was successful was proved by other witness than his own, for Panduro, Valles and de Morales all give details of his work, the last-named giving an account by one of Ponce de Leon's pupils of his education. De Morales says further that Ponce de Leon addressed his scholars either by signs or writing, and that the latter came by speech. It appears that this master committed his methods to writing. Though this work is lost it is probable that his system was put into practice by Juan Pablo Bonet. This Spaniard successfully instructed a brother of his master the constable of Castile, who had lost hearing at the age of two. His method corresponded in a great measure to that which is now called the combined system, for, in the work which he wrote, he shows how the deaf can be taught to speak by reducing the letters to their phonetic value, and also urges that finger-spelling and writing should be used. The connexion between all three, he goes on to say, should be shown the pupils, but the manual alphabet should be mastered first. Nouns he taught by pointing to the objects they represented; verbs he expressed by pantomime; while the value of prepositions, adverbs and interjections, as well as the tenses of verbs, he believed could be learnt by repeated use. The pupil should be educated by interrogation, conversation, and carefully graduated reading. The success of Bonet's endeavours are borne witness to by Sir Kenelm Digby, who met the teacher at Madrid.

Bonifacio's work on signs, in which he uses every part of the body for conversational purposes, may be mentioned before passing to John Bulwer, the first Englishman to treat of teaching the deaf. In his three works, *Philocophus*, *Chirologia* and *Chironomia*, he enlarges upon Sir Kenelm Digby's account, and argues about the possibility of teaching the deaf by speech. But he seems to have had no practical experience of the art.

Dr John Wallis is more important, though it has been disputed whether he was not indebted to his predecessors for some ideas. He taught by writing and articulation. He took the trouble to classify to a certain extent the various sounds, dividing both vowels and "open" consonants into gutturals, palatals and labials. The "closed" consonants he subdivided into mutes, semi-mutes and semi-vowels. Language, Wallis maintained, should be taught the deaf so that the pupil had first learned to write, and the written characters should be associated with some sort of manual alphabet. Names of things should be given first, and then the parts of those things, e.g. "body" first, and then, under that, "head," "arm," "foot," &c. Then the singular and plural should be given, then possessives and possessive pronouns, followed by particles, other pronouns and adjectives. These should be followed by the copulative verb; after which should come the intransitive verb and its nominative in the different tenses, and the transitive with its object in the same way. Lastly, prepositions and conjunctions should be taught. All this, Wallis held, ought to be done by writing as well as signing, for he did not lose sight of the fact that "we must learn the pupil's Language in order to teach him ours."

Dr William Holder, who read an essay before the Royal Society in 1668-1669 on the "Elements of Speech," added an appendix concerning the deaf and dumb. He describes the organs of speech and their positions in articulation, suggesting

1 For our résumé of the history we are indebted solely to Arnold *Educating Deaf Mutes, Teachers' Manual* as far as the date of the founding of the Old Kent Road Institution.
DEAF AND DUMB

teaching the pupil the sounds in order of simplicity, though he held that he must learn to write first. Afterwards the pupil must associate the letters with a manual alphabet. Holder notices that dumber is due to the want of hearing, and therefore speech can be acquired through watching the lips, though he admits the task is a laborious one. He also urges the teacher to be patient and to make the deaf person read a sentence from the lips if he gets most of the words; for he will be able to supply those he did not see, from his knowledge of English.

Johan Baptist van Helmont treated of the work of the vocal organs. Amman says that Van Helmont had discovered a manual alphabet and used it to instruct the deaf, but had not attained very good results.

George Sibscota published a work in 1670 called the Deaf and Dumb Man's Discourse, in which he contradicts Aristotle's opinion that people are dumb because of defects in the vocal organs; for they are, he believed, dumb because never taught to speak. They can gain knowledge by sight, he maintained; can write, converse by signs, speak and lip-read. Ramirez de Carion also taught the deaf to speak and write, as did P. Lana Terzi.

About George Dalgarno more is known. He wrote, in 1688, his book Acousticus, or Deaf-Mute's Preceptor, in which he makes the mistake of saying that the deaf have the advantage over the blind in opportunities for learning language. The deaf can, in his opinion, be taught to speak, and also to read the lips if the letters are very distinct. They ought to read, write and spell on the fingers constantly, but use no signs. Substantives are to be taught by associating them with the things they represent; then adjectives should be joined to them. Verbs should be taught by sulting the action to the words, and associating the pronouns with them. Other parts of speech should be given as opportunities of explaining them present themselves. Dalgarno invented an alphabet, the letters being on the joints of the fingers and palm of the left hand.

John Conrad Amman published his Dissertatio de Loquela in 1700. In the first chapter he treats, among other things, of the nature of the breath and voice and the organs of speech. In the second chapter he classifies sounds into vowels, semi-vowels and consonants, and a detailed description of each sound is given. The third chapter is devoted to showing how to produce and control the voice, to utter each sound from writing or from the lips, and to combine them into syllables and words. When the pupil had attained to considerable success in articulation and lip-reading that Amman taught the meaning of words and language; but the name of this teacher will long stand as that of one of the most successful the world has known.

Passing over Camerarius, Schott, Kerger (who began teaching language sooner than Amman did, and depended more on writing and signs), Raphael (who instructed three deaf daughters), Lasius, Arnoldi, Lucas, Vanin, de Fay (himself deaf) and many others, we come to Giacobbo Rodriguez Pereira, the pioneer of deaf-mute education in France, if we except de Fay. Beginning his experience by instructing his deaf sister, he soon attained to considerable success with two other pupils; his chief aim being, as he said, to make them comprehend the meaning of, and express their thoughts in, language. A commission of the French Academy of Sciences, before whom he appeared, testified to the genuineness of his achievements, noticing that he wrote and signed to his pupils, and stating that he hoped to proceed to the instruction of lip-reading. Pereira soon after came under the notice of the duc de Chaulnes, whose deaf godson, Sabouraux de Fontenay, became his pupil; and in five years this boy was well able to speak and read the lips. Pereira had several other pupils. Probably kindness and affection were two of the secrets of his success, for the love his scholars showed for him was unbounded. His method is only partly known, but he used a manual alphabet which indicated the pronunciation of the letters and some combinations. He used reading and writing; but signs were only called to his aid when absolutely necessary. Language he taught by founding it on action where possible, abstract ideas being gradually developed in later stages of the education.

We now come to the abbé de l'Épée (q.e.); the all-important features in this teacher's character and method were his intense devotion to his scholars and their class, and the fact that he lived among them and talked to them as one of themselves. Meeting with two girls who were deaf, he started upon the task of instructing them, and soon had a school of sixty pupils, supported entirely by himself. He spared himself no expense and no trouble in doing his utmost to benefit the deaf, learning Spanish for the sole purpose of reading Bonet's work, and making this book and Amman's Dissertatio de Loquela his guiding lights. But de l'Épée was the first to attach great importance to signs; and he used them, along with writing, until the pupil had some knowledge of language before he passed on to articulation and lip-reading. To the latter method, however, he never paid as much attention as he did to instructing by signs and writing, and finally he abandoned it altogether through lack of time and means. He laboured long on a dictionary of signs, but never completed it. He was attacked by Pereira, who condemned his method as being detrimental, and this was the beginning of the disputes as to the merits of the different methods which have lasted to the present day; but whatever opinions we may hold as to the best means of instructing the deaf we cannot but admire the devoted work that spent his life and his all in benefiting this class of the community.

Samuel Heinicke first began his work in 1754 at Dresden, but in 1758 he removed to Leipzig and started on the instruction of nine pupils. His methods he kept secret; but we know that he taught orally, using signs only when he considered them helpful, and spelling only to combine ideas. He wrote two books and several articles on the subject of educating the deaf, but it is from Walther and Fornari that we learn most about his system. At first Heinicke laid stress on written language, starting with the concrete and going on to the abstract; and he only passed to oral instruction when the pupils could express themselves in fairly correct language. Subsequently, however, he expressed the opinion that speech should be the sole method of instruction, and, strange to say, that by speech alone could thoughts be fully expressed.

Henry Baker became tutor to a deaf girl in 1720, and his success led to the establishment of a private school in London. He also kept his system a secret, but recently his work on lessons for the deaf was discovered, from which we gather that he adopted writing, drawing, speaking and lip-reading as his course of instruction. The pupils were taught to notice that after the primary stages Baker turned events of every-day life to use in his teaching. His pupils went about with him, and he taught by conversation upon what they saw in the streets—an excellent method; but it is a pity that such a good teacher had not the philanthropy to make his methods known and to give the poorer deaf the benefit of them, as de l'Epée did.

A school was established in Edinburgh in 1760 by Thomas Braidwood, who taught by the oral method. He taught the sounds first, then syllables, and finally words, teaching their meaning. In 1783 Braidwood came to Hackney, whence he moved to Old Kent Road, and in 1809 there were seventy pupils in what was lately the Old Kent Road Institution. Braidwood's method was practically a development of Wallis's. We must regard him as the founder of the first public school for the deaf in England. It was only at the beginning of the 19th century that a brighter day dawned on the deaf as a class. With the sole exception of de l'Épée no teacher had yet undertaken the instruction of a deaf child who could not pay for it. Now things began to be different. Institutions were founded, and their doors were opened to nearly all.

Dr Watson, the first principal of the Old Kent Road "Asylum," taught by articulation and lip-reading, reading and writing, explaining by signs to some extent, but using pictures much more, according to Addison, and composing a book of these for the use of his pupils. From Addison (Deaf Mutes, pp. 248 ff.) we learn what developments followed. In Vienna, Prague and Berlin, schools had been founded in rapid succession before
DEAF AND DUMB

889

Here is a statement of the course for the B.A. degree—
Second year: Algebra (from quadratics), geometry, composition, Caxton’s (Gower’s), Verne (Oration), Allen and Gough’s Latin Grammar, Myer’s General History, Goodwin’s Greek Grammar (optional), Xenophon’s Anabasis (optional).
Third year: O’iley’s or Loomis’s Plane and Spherical Trigonometry, West’s Arithmetic, Gray’s Botany, Remsen’s Chemistry, laboratory practice, Virgil’s Aeneid, Homer’s Iliad (optional), Meldejohn’s History of English Language and Literature (two books), Maertz’s English Literature, Haygarth’s History, original composition.
Fourth year: Fowler’s English Language, original composition, Gilroy’s History of Civilization, Silliman’s German Grammar, Joyne’s German Reader, Lecky’s History, Guyot’s Earth and Man, Hill’s Elements of Psychology, Heath’s Moral Philosophy, Butler’s Analogy, Bascom’s Elements of Beauty, Perry’s Political Economy, Gallaudet’s International Law.
Fifth year: Arnold’s Manual of English Literature, Maertz’s English Literature, original composition, Gilroy’s History of Civilization, Silliman’s German Grammar, Joyne’s German Reader, Lecky’s History, Guyot’s Earth and Man, Hill’s Elements of Psychology, Heath’s Moral Philosophy, Butler’s Analogy, Bascom’s Elements of Beauty, Perry’s Political Economy, Gallaudet’s International Law.

In 1803 Gallaudet opened his college thirty-five years after he had conceived the idea, and with only a few students. It was the first educational institution in the United States, and has become, in fact, the center of deaf and dumb education in the world. There are now in the country, besides Gallaudet College, four other institutions for the education of the deaf, each of which has the support of the people. They are: the New York Institution for the Instruction of the Deaf and Dumb and the blind, the Institution for the Blind and the Deaf, the Institution for the Instruction of the Deaf and Dumb, and the Institution for the Instruction of the Deaf and Dumb and the Mentally Retarded. Each of these institutions has a staff of teachers, and each is connected with a group of schools for children of deaf and dumb. The work of these institutions is conducted on the lines laid down by Gallaudet, and is carried on in close cooperation with the state and federal governments.

The following account of the work done at the National Deaf-Mute College at Washington is worth attention, as the results are unique, and are often strangely ignored.
In 1886 a royal commission investigated the condition and education of the deaf in Great Britain, and in 1889 issued its report. Some of the recommendations most worthy of notice were that deaf children from seven to sixteen years of age should be compelled to attend a day school or institution, part, or the whole, of the expense being borne by the local school authority; that technical instruction should be given, and that all the children should be taught to speak and lip-read on the "pure" oral method unless physically or mentally disqualified, those who had partial hearing or remains of speech being entirely educated by that method. To the last mentioned recommendation—concerning the method to be adopted—two of the commissioners took exception, and another stated his recognition of some advantage in the manual method.

As a result of the report of the royal commission a bill was passed in 1893 making it compulsory for all deaf children to be educated. This was to be done by the local education authority, either by providing day classes or an institution for them, or by sending them to an already existing institution, parents having the choice, within reasonable limits, of the school to which the child should go. School-board classes came into existence in almost every large town where there was no institution, and sometimes where one existed. Those who uphold the day-school system advance the arguments that the pupils are not, under it, cut off from the influence of home life as they are in institutions; that such influences are of great advantage; that this system permits the deaf to mix freely with their hearing brethren, &c.

The objections, however, to this arrangement outweigh its possible advantages. The latter, indeed, amount to little; for home influences in many cases, especially in the poorer parts of the large cities, are not the best, and communication with the hearing children who attend some of the day schools may not be an unmixed blessing, nor is freedom to run wild on the streets between school hours. But it may be urged further that it is difficult, except in very large towns, to obtain a sufficient number of deaf children attending a day school to classify them according to their status, while it is more than one teacher can do to give sufficient attention to several children, each at a different stage of instruction from any other. Moreover, the deaf need more than mere school work; they need training in morals and manners, and receive much less of it from their parents than their hearing brothers and sisters. This can only be done in an institution wherein they board and lodge as well as attend classes. The existing institutions were from 1893 placed, by the act of that date, either partly or wholly under the control of the school board. They were put under the inspection of the government, and as long as they fulfilled the requirements of the inspectors as regards education, manual and physical training, outdoor recreation and suitable class-room and dormitory accommodation, they might remain in the hands of a committee who collected, or otherwise provided, one-third of the total expenditure, and received two-thirds from public sources. Or else, the institution might be surrendered entirely to the management of the public school board. In that case the whole of the expenditure was to be borne by that body. Extra government grants of five guineas per pupil are now given for class work and manual or technical training. Such is the state of things at the present day, except, of course, that the school board has given to the county council as local authority.

Some teachers have asked for the children to be sent to school at the age of five instead of seven. This savours of another confession that the "pure" oral method had not done what was expected of it, and that it is necessary to go back to the old method, and perhaps to devise a new one. The advice is, no doubt, required, but the question is not one of method itself, but of the greatest possible amount of responsibility for more teachers, so that, the classes being smaller, each pupil should receive more attention; this meant more money, and so this was asked for; then day schools would remedy the failure by giving the pupils a chance of being clearly understood by all those they met. We are told the teachers were unsatisfactory; finally, more time is needed. And yet the language of the pupils is no better to-day than it was in 1881, even though they were at school only four or five years, indicating that the condition of the deaf children is not improved to nine or ten now.

To Addison's Report on a Visit to some Continental Schools for the Deaf (1904–1905) we are indebted for the following information. The new school at Frankfort-on-Main, accommodating forty or fifty children at a cost of £40 to £50 per head, is modelled on the plan of a family home. The main objects are to obtain good speech and lip-reading and to use these colloquially: the work is very thorough and the teaching very skilful. At Munich those of the hundred pupils who have some hearing are separated from those who are entirely deaf, and are taught by ear as well as by mouth. At Vienna (Royal Institution) a small proportion of the pupils are day scholars, as they are at Munich, and the teaching is, of course, carried on by the oral method, as it is all over Germany. Here, however, the teachers are divided into four classes, A, B, C and D. The A class is taught the oral method only. In the Jews' Home at Vienna the semi-deaf are taught by the acoustic method, and are not allowed to see the teacher's lips at all. At Dresden, a large school of 240 pupils, the director favours separate classes for the purely oral pupils, and divides his pupils into A, B and C divisions, according to intelligence. In the first division good speech is obtained. Saxony boasts a home for deaf homeless women, grants premiums for deaf apprentices, and trains its teachers at the deaf-mute college of Halle, in the "direction of the deaf," and has also a plan for a day school. In the royal institution the four schools in Vienna, besides the 189 pupils mentioned, have an average of 29% of the whole—are sent to Nyborg. The rest— all the totally deaf—remain another year at Fredericia and are then divided into the A, B and C divisions before mentioned, and on the same criterion of intelligence. Those of the A class are sent to Copenhagen, where they are taught by the manual method, no oral work being attempted. Those in B class, numbering 19% of the deaf, remain in the residential institution in Fredericia and are taught both oral and manual, and are divided into a board and attend a special day school. These 38% of the deaf, and those with whom they live encourage them to speak when out of as well as when in school. The buildings and equipment generally are excellent. Hand signs are used at Nyborg, indicating the "articulation of the vocal organs" when speaking, and, as might be expected, the "lip" reading is 90% more correct when these symbols—infinitely more visible than most of the movements of the vocal organs and face when speaking—are used at the same time. The idea of these signs is that of collocating with the manual method a Marked and Graham Bell's Visible Speech, in which a written symbol is used to indicate the position of the vocal organs when uttering each sound; it is a kind of phonetic writing which is to a slight extent illustrative of the position of the organs at every moment. In Italy, for example, the deaf are taught articulation, to describe the position of the vocal organs. We give these details from Mr Addison's notes because it is to Germany that so many look for guidance to-day, and it is the home of the A, B, C, D, scope and method of training in Denmark into the four schools which are controlled by one authority, struck him very favourably, and so is given rather fully.

In France most of the schools are supported by charity, and the others by government institutions and public funds. Parts of houses have 163 pupils lately, at Bordeaux for girls; having 225 inmates, and at Chambréy with 86 boys and 38 girls. In the great majority the method of instruction is professedly pure oral. But, said Henri Guillaud [Res., 388], the deaf are better informed than those who come to learn within a month that the deaf would have a "natural" appearance. In reality all of the schools use the combined method; only they are not willing to admit it, because the oral method is the official method, imposed by the inspectors of the minister of the interior.

In Denmark again, we are told that the teachers sign in most of the schools, which are professedly pure oral.

In Sweden, schools for the deaf have ceased to depend, as they did up to 1891, upon private benevolence, and the system is generally free. Scandinavia, and especially Denmark, have the largest number of deaf, but as the pupils are divided into A, B and C divisions, as in Denmark and Dresden, in the two latter divisions of which signs are allowed. In Norway the method is the oral.

Methods of Teaching.—There have always been two principal methods of teaching the deaf, and all education at the present time is carried on by means of one or other or both of these.

Where there is sufficient hearing to be utilized, it is sometimes given thereby as well, though this auricular method does not seem to make much headway, and experience is not in favour of believing that the sense of hearing, where a little exists, can be "cultivated" to any marked degree. It is really
impossible to draw hard and fast lines between these means of instruction. One merges into another, and this other into the next; and no two teachers will, or can, adopt exactly the same lines. It is not desirable that they should, for much must be left to individuality. Orders, rules, methods, should not be absolute laws. Observe them generally, but dispense with them as circumstances, the pupil and opportunity may require. Strong individuality, sympathy, enthusiasm, long intercourse with the deaf, are needed in the teacher, and it is surely obvious that every teacher should have a full command of all the primary means of instruction to begin with, and not of one only.

Where deafness is absolute, or practically so, we have to seek additions, to Manual. America, method, really here, others. use of printing adopts generally for every deaf, means circumstances, laws. to instruction.

The Manual Alphabet. (One-handed.)

*Fig. 2.—The Manual Alphabet. (Two-handed.)*

for means that will appeal to the eye instead of the ear. Of these, we have the sign language, writing and printing, pictures, manual alphabets and lip-reading. We have to choose which of these is to be used, if not all, and which must be rejected, if any. Moreover, we have to decide how much or how little one or another is to be adopted if we employ more than one. Hence it is obvious that there may be many different systems and subdivisions of systems. But the two main methods are the manual, which generally depends upon all the above-mentioned means of appealing to the eye except lip-reading, and the oral, which adopts what the manual method rejects, uses writing and printing and perhaps pictures, but excludes finger-spelling and (theoretically) signs. To these we must add a third means of instruction—the combined system—which rejects no means of teaching, but uses all in most cases. The dual method need hardly be called a separate method or system, for it implies simply the use of the manual method for some pupils and of the oral for others. Nor need we call the mother's (=intuitive or natural) a separate method in the sense in which we are using the word here, for it is rather a mode of procedure which can be applied manually or orally indiscriminately. The same may be said of the grammatical "method"; also of the "word method," which is really the "mother's." The "eclectic method" is practically the combined system, or something between that and the dual method, and hardly needs separate classification.

Let us notice the manual method, the oral method, and the combined system, considering with the last the "dual method."

The chief elements of the manual method are finger-spelling, reading and writing and signing. These are used, that is to say, as means of teaching English and imparting ideas.

Manual. Signs are used to awaken the child's thoughts, finger-spelling and writing are used to express these thoughts in the vernacular. The latter are used to express English, the former to explain English.

We give two manual alphabets, the one-handed being used in America, on the continent of Europe with some variations and additions, in Ireland, and also to some extent in England; the two-handed in Great Britain, Ireland and Australia. A speed of 130 words a minute can be attained when spelling on the fingers. Words are quite readable at this speed.

Although reading and writing are common to both methods, the manual and oral, as a matter of fact they seem to be used considerably more in the former than in the latter.

In the oral method articulation and lip-reading are chiefly relied upon; reading and writing are also adopted. The phonetic values of the letters are taught, not the names of the letters; for instance, the sound of the letter d in "hat" is taught instead of the name of the letter (long a), though of course the latter is taught where such is the proper pronunciation, as in "hate."

**Oral.**

Order in which the Vowel Sounds are to be taught.

Here is a chart which was lately in use:

These charts are given as examples of those used, but they vary in different schools, as does the order of teaching the vowel and consonant sounds and the combinations. The exact order is not important. Words are made up by combining vowels and consonants as soon as the pupil can say each sound separately.

Here are extracts from the directions on articulation written by a principal of the teacher of the lowest class, which show the method of procedure:

1. Produce the sound of a letter. Each pupil to reproduce, and correct, and mark in the tablet.
2. Point to the letter on the tablet, and make each pupil say it.
3. The same with combinations of vowels and consonants.
4. Instead of tablet, each pupil to use rough exercise-book.
5. Write on tablet, and make each pupil articulate from the teacher's writing.
6. When a combination is made of which a word may be made, make all write in their books, thus:—te, te, te, sh, sh, sh.
7. When one pupil produces a combination correctly, the others read it from him. In this way make them exercise each other.
8. When they have a good many sounds and combinations written in their books, make them sit down and say them off their books as hearing children do.
9. Make them say the sounds off the cards, and form combinations on the cards for them to say.
10. Take each vowel separately and make each pupil use it before and after each consonant.

The above will suggest other exercises to the teacher.

Give breathing exercises. Incite emulation as to deep breathing and slow expiration. Never force the voice. Make the pupil speak out, but do not let him strain either the voice or vocal organs. Do not force the tongue, lips, or any organ into position more than you can help. Rather give it gentle, as it were, a guide to its progress.

A is the basis of all the vowels, being most like all, it is taken first. It is an open vowel. Do not make grimaces, or exaggerate. If false sound be produced do not let the pupil speak loudly; make him speak quietly. If nasal sound be produced do not pinch the nose, but first take the back of the child's hand, warmly breathe on it, or get a piece of glass, and let the child breathe on it, or press the back of the tongue down. Show the child that when you are saying a your tongue lies flat or nearly so, and you do not raise the back of the tongue. Prefix ə to a and make the pupil say ə a, thus, ə a, then a a.

If the child does not imitate at the first the teacher should take the back of the hand and let the child feel the puff of air as ə is formed on the lips.

P is produced by the volume of air brought into the cavity of the mouth being checked by the perfect closure of the lips, which are then opened, and the accumulated air is propelled. The outburst of this propelled air creates the sound of P. Take the pupil to see for himself. Place your hand on your hair, it has no vibration and is the most simple. The consonants should first be joined to each vowel separately, and to prevent the pupils making an after-sound the letters should be said with a pause between, thus, A ə a, etc. As the become more familiar with them, lessen the pause until it is pronounced properly:—ap.

These directions, which are only brief examples of those given for one particular subject in one particular class, will give an idea of the mode of beginning to teach articulation and lip-reading.

The combined system, as before mentioned, makes use of both the manual and oral method, as well as the auricular, without any hard and fast rule as regards the amount of instruction to be given by means of each, but using more of one and less of another, or vice versa, according to the aptitude of the child. It thus follows the sensible, obvious plan of fitting the method to the child and not the unnatural one of forcing the child to try to fit the method.

The following is the word the same principal would teach language to beginners in the combined system:

The letters p, q, b and d of the Roman text are to be taught first. The pupils are to do them 9 in. long on the blackboard or table first; then trace them on the frames; then on slips of paper with pen and ink, or in rough exercise-book with pen and ink. The whole is then to be taught in the same manner, also the small and capital script.

When the English alphabet has been mastered in the above four forms the pupil may proceed to the printing and writing of his own name. Then his teacher's and classmates' names. Then the names of other words and the phrases, things and actions with which he has to do in his daily life. Every direction the teacher has to give in school and out of school should be expressed in speech, writing or finger-spelling, or by any two or all three means. Repetition of such directions by the pupil enables him to learn words before he has finished the alphabet.

All words to be spelled on one hand first; then two. When a few words have been memorized, they should be written on slips of paper, then in the exercise-books and dated. After this there should be further repetition and exercising. The same course should be taken with phrases and short sentences. Names of persons should be written on cards and slips of paper and pinned to the chest. Names of things by the pupil and the teacher. Names of letters on cards laid in the rooms. Where the object is not available use a picture, or draw the outline and make pupil do the same. Never nod, or point, or jerk the finger, or use any other gesture, without previously giving the word, and when the latter is understood drop the gestures altogether.

Never allow a single mistake to pass uncorrected, and make pupils always learn the corrections.

Language should be a translation of life. It should proceed all day long, out of school as well as in it. If spoken so much the better, but finger-spelling is not a hindrance but a valuable help to its acquisition.

In most language lessons, especially those exemplifying a particular form of sentence, the pupils should:

1. Correct each other's mistakes. Correct 'mistakes' designedly made by the teacher.
2. Teacher rubs out a word here and there on the blackboard or takes pupils to supply them.
3. Pupils to answer questions, giving the subject, predicate and object of the sentence as required, e.g. A farmer ploughs the ground. Who ploughs the ground? What does a farmer do? What does he plough? Also additional and illustrative questions: e.g. Does the ground plough the farmer? Does a farmer plough the sea? Does he eat the ground? &c.
4. Pupils should learn meanings or synonyms of unfamiliar words before such words are signalled.
5. Teacher requires pupils to exemplify it in a sentence, e.g. sows, He sows the seed.
6. Let them give as many sentences as they can think of in the same form.

Events, occupations, incidents, objects, pictures, reading-books, newspaper cuttings and correspondence should all be used.

The "pure" oral method, as before noticed, came with a bound into popularity in the early seventies. Since then it has had everything in its favour, but the results have been by no means entirely satisfactory, and there is a marked tendency among advocates of this method to withdraw from the extreme position formerly held. Opinion has gradually veered round till they have come to seek for some sort of *via media* that shall embrace the good points of both methods. Some now suggest the "dual method"—that those pupils who show no aptitude for oral training shall be taught exclusively by the manual method and the rest by the oral only. While this is a concession which is positively amazing when compared with the title of the booklet containing utterances of the Abbé Tarra, president of the Milan conference in 1880:—The Pure Oral Method to be abandoned, so that we believe what in no case should the instruction be given by the oral method alone, and that the best system is the "combined." That the combined system is detrimental to lip-reading has not much more than a fraction of truth in it, for if the command of language is better, the pupils can supply the lacunae in their lip-reading from their better knowledge of English. It is found that they have constantly to guess words and letters from the context. Teach all by and through finger-spelling, reading, writing and signing where necessary to explain the English, and teach those in whose case it is worth it by articulation and lip-reading as well. Signs
should be used less and less in class work, and English more and more exclusively as the pupil progresses. English is in any and every book. A fail to read of the 'book' should be a failure of the deaf, as in America. They are in perfect understanding and sympathy with their pupils, which is not always the case with hearing teachers. Statistics which we collected in London showed the following results of the education of 403 deaf pupils after they had left school:

<table>
<thead>
<tr>
<th></th>
<th>Manual</th>
<th>Combined</th>
<th>Oral</th>

<tr>
<td>Unsatisfactory result</td>
<td>5%</td>
<td>7%</td>
<td>44%</td>
</tr>
</tbody>
</table>

That the combined system should show slightly less advantage than the exclusively manual method is what we might perhaps expect, for the time given to oral instruction means time taken from teaching language speedily, the manual method being, we believe, the best of all for this. But it may be worth while to lose a little in command of language for the sake of gaining another means of expressing that language. Hence we advocate the combined system, regarding speech as merely a means of expressing English, as writing and finger-spelling are, and a good sentence written or finger-spelled as being preferable to a poor one which is spoken, no matter how distinct the speech may be. It is no answer to point to a few isolated cases where the oral method is considered to have succeeded, for one success does not counterbalance a failure if by another method you would have had two successes; and moreover, these oral successes would have been still greater successes—we are taking language in any form as our criterion—had the teacher fully known and judiciously used the manual method as well as the oral.

The exclusive use of the oral method leads, generally speaking, to comparative failure, for the following, among other reasons:—(1) It is a slow way of teaching English, the learning to speak the elements of sound taking months at least, and seldom being fully mastered for years. (2) The word problems by the way, starts once in a while, without taking their component phonetic elements separately; but it has yet to be proved that any quicker progress is made by this means of teaching speech than by the other. (2) Lip-reading is, to the deaf, sign-reading with the disadvantage of being both microscopic and partially hidden. The deaf hear nothing, they only partly see tiny movements of the vocal organs. Finger-spelling, writing, signing, are incomparably more visible, while 130 words a minute can be taken by finger-spelling, and require at this speed, as they are to the deaf—made by the vocal organs are entirely arbitrary, and have not even a fraction of the redeeming feature of naturalness which orals demand in ordinary gestures. (4) Circumstantial signs, such as light, position of the special sign, &c, are undesirable for the lip-reading to approach certainty. (5) Styles of speech vary, and it is a constant experience that even pupils who comparatively easily read their teacher's lips, to whose style of utterance they are accustomed, are at a complete loss to follow another's lips. (6) There is a great difference between similarity between certain sounds as seen on the lips, e.g. between f and s, and between p and s, and between k and g, which is meant has usually to be guessed from the context, and this requires a certain amount of knowledge of language, which is the very thing that is supposed to be imparted. (7) The deliberate avoidance by the teacher of the pupil's own language—signs—as an aid to teaching him English. If a hearing boy does not understand the meaning of a French word he looks it up in a dictionary and finds his English equivalent. The deaf boy does not understand a word in English, the simplest, quickest, best way to explain it is, in most cases, to sign it. (8) The distaste of the pupil for the method. This is common. (9) The mechanical nature of the system, which is more likely to appeal to his imagination in it. (10) The temptation to the teacher to use very simple phrases, owing to the difficulty the pupil has in reading others from his lips. Consequently the pupil seldomly learns advanced language, the language of books.

Other means of educating the deaf in addition to the oral should have a fair trial in modern conditions for the same length of time that the oral method has been in operation. To consider pupils taught manually and to fail to offer the fair trial of the manual method or combined system, when those pupils have confessedly been relegated to the manual class because of "dulness" (as in the case of the C divisions in Denmark and Dresden), is obviously unfair. The manual method and the oral method is the best for the brightest pupils. The comparing of oral pupils taught by a tutor to themselves with manual pupils from an institution crippled and hampered by need of funds, where they had to take their chance in a class of twelve, and the comparison of oral pupils of twelve years' standing with combined system pupils of four years' age, are also unfair. Reference may be made on this subject to Heisidek's remarkable articles on the question of education, which appeared in the American Annals of the Deaf from April 1899 to January 1900.

The opinions of the deaf themselves as to the relative merits of the methods of teaching them is quite particular attention. The ignorance of their expressed sentiments by those in authority is remarkable. In the case of school children it might fairly be argued that they are too young to know what is good for them, but with the adult deaf who have lived to learn the advantages by their own experience in the battle of life it is otherwise. In Germany, the home of the "pure" oral method, 800 deaf petitioned the emperor against that method. In 1903 no fewer than 2671 of the adult deaf of Great Britain and Ireland who had passed through the schools signed a petition in favour of the combined system. The figures are remarkable, for children under sixteen were excluded, those who had not been educated in schools for the deaf were excluded, and the offer of the deaf has been made compulsory, while many thousands who live scattered about the country in isolation probably never even heard of the petition, and so could not sign it. In America an overwhelming majority favour the combined system, and it is in America that by far the best results of education can be seen. At the World's Congress of the Deaf at St Louis in 1904 the combined system was upheld, as it was at Liège. From France, Germany, Norway and Sweden, Finland, Italy, Russia, everywhere in fact where they are educated, the deaf crowd upon us with expressions of their emphatic conviction, repeated again and again, that the combined system is what meets their needs best and brings them most happiness into their lives. The majority of deaf in every known community, and this is in face of the fact that so much education is so great that we venture to say that in no other section of the community could there be shown such an overwhelming preponderance of opinion on one side of any question which affects its well-being. In the case of the deaf who have these qualifications, the deaf have been taught in the strictest ignorance of the manual method, which he has been sedulously taught to regard as clumsy and objectionable.

The Blind Deaf.

In the summary tables (p. 283) of the 1901 British census the following numbers are given of those suffering from other afflictions besides deafness:

<table>
<thead>
<tr>
<th>Affliction</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blind and deaf and dumb</td>
<td>58</td>
</tr>
<tr>
<td>Blind and deaf</td>
<td>389</td>
</tr>
<tr>
<td>Blind, deaf and dumb and lunatic</td>
<td>5</td>
</tr>
<tr>
<td>Blind, deaf and lunatic</td>
<td>35</td>
</tr>
<tr>
<td>Blind and dumb and lunatic</td>

<td>8</td>
</tr>
<tr>
<td>Deaf and dumb and feeble-minded</td>
<td>221</td>
</tr>
<tr>
<td>Deaf and feeble-minded</td>
<td>100</td>
</tr>
</tbody>
</table>

In addition to these, 2 are said to be blind, dumb and lunatic; 20 dumb and lunatic; 3 blind, dumb and feeble-minded, and 222 dumb and feeble-minded. These are certainly outside our province, which is the deaf. The "dumbness" in these four classes is aphasia, due to some brain defect.

Of those in the list, classes 7, 8, 9 and 10 are (we are strongly of opinion) incorrectly described, being, as we think, composed of those who are simply feeble-minded as well as, in classes 7 and 8, blind. Their so-called "dumness" is merely inability of the brain to notice what the ear does actually hear and to govern the vocal organs to produce articulate sound. Many of classes 9 and 10, however, may not be "feeble-minded" as all, but only rather dull pupils whom their teachers have failed to educate.

It is safe to say that in some instances in classes 3, 4, 5 and 6 the persons were only assumed to be deaf. Again, cases of deaf people who to all appearance could not fairly be called insane but who may have had violent temper or some slight eccentricity being relegated to an asylum have come to our notice. A good teacher might accomplish much with some of these described as lunatic in classes 5 and 6. Finally, classes 3 and 4 may have been reckoned owing to their timeliness and brooding inseparable to a great extent from such terrible affictions as blindness and deafness combined. Probably the isolation became intolerable, and if only they had had some one who understood them to educate them their reason might have been saved.

We are most concerned with the first two classes, and in considering them have to take individual cases separately, as there is no regular institution for them in Great Britain.
Mr. W. H. Illingworth, head master of the Blind School at Old Trafford, Manchester, tells how David Maclean, a deaf and blind boy, was taught, in the 1903 report of the conference of teachers of the deaf. The boy lost both sight and hearing before he was six years of age, which was an advantage, and could still speak or whisper to some extent when admitted to school. His teacher began with kindergarten and attempts at proper voice-production. He gave the sound of "ah" and made David feel his larynx. Then he tickled the boy under his arms, and when he laughed made him feel his own larynx, so that the boy should notice the similarity of the vibration. Then, acting on the theory that brain-waves are to some extent transmittable, Mr. Illingworth procured a hearing boy as companion, and, ordering him to keep his mind fixed on the work and to place one hand on David's shoulder, made him repeat what was articulated. The blind-deaf boy's right hand was placed on Mr. Illingworth's larynx and the left on the companion's lips. Thus the pupil felt the sound and the companion's imitation of it, and soon reproduced it himself. From this syllables and words were formed by degrees. The pupil knew the forms of some letters of the alphabet in the Roman type before he lost sight and hearing, and the connexion between them and the Braille characters and manual alphabet was the next step achieved. This, and all the steps, were aided to a great extent by the hearing and speaking companion's sympathetic influence—a kind of continuation of mind, in Illingworth's opinion. After this stage his progress was comparatively quick and easy; he read from easy books in Braille, and people spellled to him in the ordinary way by forming the letters with their right hand on his left.

From Mr. B. H. Payne of Swansea comes the following account of how four blind-deaf pupils were taught:

"We have received four pupils who were deaf-mute and blind, one of them being also without the sense of smell. One was born deaf, the others having lost hearing in childhood. There was no essential difference between the methods employed in their education and those of 'sighted' deaf children. Free-arm writing of ordinary script was taught on the blackboard, the teacher guiding by the right hand, or another pupil guiding it over the teacher's pencilling. The script alphabet was cut on a slate, and the pupil's pencil made to run in the grooves. The one-hand alphabet, used with the left hand, was employed to distinguish the letters so written. The script alphabet was also formed in wire for him. The object was to enable the pupil when he had gained language to write to friends and others who were unacquainted with Braille, but the latter notation was taught to enable him to read or at least to be understood by the talk of the deaf.

Both one- and two-hand alphabets were taught, the teacher forming the letters with one of his own hands upon the pupil's hand. The name of the object presented to the pupil was spelled and written repeatedly. All the combinations of letters were made, and the pupil's abilities were tested by composition and action by performance. The words 'Come with me' were spelled before he was guided to any place, and other sentences were spelled as they would be spoken to a 'hearing' child in appropriate associations. The blind pupil followed with his hands the signs he does not hear, and he was introduced to the spoken language in this way readily learned to sign himself, the art being of advantage in stimulating and in forming the mind, and explaining language to him. One of the pupils was confirmed, and in preparation for the rite over 500 combinations were put to him by his interpreter. His education was continued in Braille. The deaf-born boy developed a fair voice, and could imitate sounds by placing his hand on a speaker's mouth. Two of them had a keen sense of humour, and would often place one hand to his head and the other to his mouth to feel the smile with which a bit of pleasantry was responded to. In connexion with the pupil who was confirmed, the vicar who examined him declared that none of his questions had been answered better even by candidates possessed of all their faculties than they were by this blind-deaf boy."

Mr. W. M. Stone, principal of the Royal Blind School at West Craigmillar, Edinburgh, gives this very interesting information:

"We have five blind-deaf children in this institution, and all are wonderfully clever and intelligent. In all cases the children possessed hearing for a time and had some knowledge—very slight in some cases—of the Braille alphabet. The method of teaching is, first to teach them the names of common objects on their fingers. A well-known object is put in the child's hand and then the word is spelled on the hand,—the child's hand of course. The child learns to associate these signs—he does not hear them—with the object, and so learns the name. Other names are then given and similar names are associated together, and by noticing the difference in the names the child gradually grasps the idea of an alphabet. For instance, if he learns the words cat, bat and mat, he will quickly distinguish that the words are alike except in their initial letters. When in this way language has been acquired he is taught the Braille system of reading for the blind and his progress is now very rapid. This method may appear very complicated and difficult, but in reality it is not so. There are no institutions in Great Britain specially for the blind-deaf, nor are there any in America. I do not know of any on the continent. Our own system is followed here as our own, but we have as our deaf and blind other children, and in some ways are more advanced than seeing and hearing children of their own ages. They not only read, write and do arithmetic, but they do typewriting and much manual work."

Mr. Addison mentions two deaf and blind pupils who were taught by the late Mr. Paterson of Manchester, and a third in the same school later on. Another was taught in the asylum for the blind in Glasgow, though she only lost hearing and became deaf at ten.

Mr. William Wade has written a monograph on the blind-deaf of America, in the preface to which he points out, rightly, that the education of the blind-deaf is not such a stupendous task as people imagine it to be.

"It may not be amiss," he says, "to state the methods of teaching the first steps to a deaf-blind pupil, that the public may see how excellently the one deaf-blind pupil is taught and then have the principle applied to the deaf-deaf pupil, and thus see that what is taught to the deaf-blind pupil is really taught to the deaf-deaf pupil. The deaf-blind pupil is taught by the same method as any other pupil; and, at the same time the name of the object is spelled into its hand by the manual alphabet. (The one-hand alphabet is in vogue in America.) By patient persistence, the pupil comes to recognize the manual spelling as a name for a familiar object, and when the next step is taken—associating familiar acts with the corresponding manual spelling. A continuation of this simple process gradually leads the pupils to the comprehension of language as a means for communication of thoughts. Mr. Wade is right. Given a sympathetic and resourceful teacher with strong individuality, common-sense, patience, and the necessary amount of time, anything and everything in the way of teaching them is not only possible but certain to be achieved. Language, give the deaf and blind a working command of that and everything else is easy.

In the New York Institution for the Deaf ten blind-deaf pupils were educated, up to the year 1901. Nearly all of these lost one or both senses after they had been able to acquire some knowledge with their aid. In the Perkins Institution for the Blind, Boston, five were taught as children, the others educated at Manchester, and conducted by Dr. Samuel G. Howe (p. 274); all honour is due to him for being the pioneer in attempting to teach this class of the community, for she was the first blind-deaf person to be taught. Many other schools for the deaf or blind have admitted one or two pupils suffering from both afflictions. In all, seventy cases are mentioned by Mr. Wade of those who are quite blind and deaf, and others of people who are partially so. The most interesting, of course, of all these is Helen Keller, if we except Laura Bridgman, in whose case the initial attempt to teach the blind-deaf was made. Helen Keller was taught primarily by finger-spelling into her hand, and signing (which she, of course, felt with her hands) where necessary. Her first teacher was Miss Sullivan. The pupil "acquired language by practice and habit rather than by study of rules and definitions." Finger-spelling and books were the two great means of educating her at all times. After her grasp of language had been brought to a high standard, Miss Fuller gave her her first lessons in speech, and Miss Sullivan continued them, the method being that of making the pupil feel the lips and other organs of the teacher. She learnt to speak well, and to tell (with the assistance of finger-spelling) what some people say by feeling their mouth. Her literary style became excellent; her studies included French, German, Latin, Greek, arithmetic, algebra, geometry, history, ancient and modern, and poetry and literature of every description. Of course she had many tutors, but Miss Sullivan was "eyes and ears" at all times, by acting as interpreter, and this patient teacher had the satisfaction of seeing her pupil pass the entrance examination of Harvard University. To all time the success attained in educating Helen Keller will be a monument of what can be accomplished in the most favourable conditions.

(A. H. P.)
DEÁK, FRANCIS (Ferencz), (1803-1870), Hungarian statesman, was born at Sőjtőr in the county of Zala, on the 17th of October 1803. He came of an ancient and distinguished noble family, and was educated for the law at Nagy-Kanizsa, Pépá, Raab and Pest, and practised first as an advocate and ultimately as a notary. His first case was the defence of a notorious robber and murderer. His reputation in his own county was quickly established, and when in 1833 his elder brother Antal, also a man of extraordinary force of character, was obliged by ill-health to relinquish his seat in the Hungarian parliament, the electors chose Ferencz in his stead. He took an active part in the proceedings of the diet at Pressburg and made the acquaintance of Ödön Bebthy and the other liberal leaders. No man owed less to external advantages. He was to all appearance a simple country squire. His true greatness was never exhibited in debate. It was in friendly talk, generally with a pipe in his mouth and an anecdote on the tip of his tongue, that he exercised his extraordinary influence over his fellows. Convinced from the first of his disinterestedness and sincerity, and impressed by his penetrating shrewdness and his instinctive faculty of always seizing the main point and sticking to it, his hearers soon felt an absolute confidence in the deputy from Zala county. Perhaps they were struck by Ferencz’s Peder’s independence, for he was neither a soldier, nor a diplomatist, nor a writer, who appealed to no passion but patriotism, and who avoided power with almost oriental indolence instead of seeking it, became, in the course of a long life, the leader of a great party by sheer force of intellect and moral superiority.

During the diet of 1839-1840 Deák succeeded in bringing about an understanding between a reactionary government, sadly in want of money, and a Liberal opposition determined that the nation should have its political privileges respected. “Let us put all jealousy on one side and allow him the pre-eminence,” wrote Széchenyi of Deák (April 30th, 1840). Deák would not go to the diet of 1833-1844, though he had received a mandate, because his election was the occasion of bloodshed in the struggle between the Clericals who would have ousted him and the Liberals who brought him in. In 1845, however, he accepted the post of minister of justice offered to him by Lajos Kossuth. He never ceased to urge moderation in those stormy days, holding rather with Érővős and Batthyány than with Kossuth, and he went more than once to Vienna to endeavour to effect a compromise between the Radicals and the court. But when the ill-will of the Vienna government became patent, and the sentiments of the king doubtful, he resigned together with Batthyány, but without ceasing to be a member of the diet. It was he who drew up the resolution of the Lower House in reply to the despatch of the Austrian ministry demanding the recall of the Hungarian constitution. It was he who urged the Hungarian cabinet not to depart a hair’s-breadth from their legitimate position. He was one of the parliamentary deputation which waited in vain upon Prince Windischgrätz in his camp. (See HUNGARY: History.) He then retired to his estate at Kehida. After the war of independence he was tried by court-martial, but acquitted.

During his imprisonment he lived in complete confinement. He rejected Schmerling’s proposal that he should take part in the project of judicial reform, but on the other hand he held completely aloof from the widespread, secret revolutionary movements. After 1844 he spent the greater part of his time at Pest, and his little room at the “Queen of England” inn became the meeting-place for those patriots who in those dark days looked to the wisdom of Deák for guidance. He used every opportunity of stimulating the moral strength of the nation and keeping its hopes alive. He invited the nation to contribute to the support of the orphans of Vörösmarty when that great poet died. He drew up the petition of the academy to the government, in which he defended the maintenance of this asylum of the national language against Austrian intervention. He trusted that, as had so often happened in the course of Hungarian history, the weakness and blindness of the court would help Hungary back to her constitutional rights. Armed resistance he considered dangerous, but he was an immutable defender of the continuity of the Hungarian constitution on the basis of the reforms of 1848. His principles alienated him from the Kossuth faction, which looked for salvation to a second war with Austria, engineered from abroad; but he was equally opposed to the attitude of resignation taken up by the followers of Széchenyi, who, according to Deák, always regarded the world from a purely provincial point of view.

The war of 1849 convinced the Austrian government, at last, of the necessity of a reconciliation with Hungary; but the ensuing negotiations were conducted not through Deák, but through the Magyar Conservatives. In 1860 Deák rejected the October diploma (see HUNGARY: History), which was simply a cast-back to the Maria Theresa system of 1747; but, at the request of the government, he went to Vienna to set forth the national demands. On this occasion he insisted on the re-establishment of the constitution in its integrity as a sine qua non. Meanwhile, it became more and more evident that the Conservative party had no standing in the country. The majority of the deputies returned to the diet of 1861 were in favour of asserting their rights by a resolution of the House, instead of petitioning for them by an address to the crown; hence arose the two parties of the Addressers and the Resolutioners. Schmerling’s programme of Ferencz Deák was so inconsiderate and so little suited to the needs of the deputies for Pest, that in favour of an address rather than of a resolution, and his great speech on the subject (May 13th, 1861) converted the majority hostile to an address into a majority for it. The object of the Addressers was to make the responsibility for a rupture rest on the Austrian government. Nevertheless, the court found the address so voted inadmissible; whereupon, on Deák’s motion, the Hungarian diet drew up a second address vigorously defending the rights of the nation, and solemnly protesting against the usurpations of the Austrian government. The speech which Deák made on this occasion was his finest effort. Henceforth all Europe identified his name with the cause of Hungary. The Magyar Conservatives hereupon entered into negotiations with Deák, and the Austrian government, more than ever convinced of the necessity of a reconciliation, was ready to take the first step. If Hungary would take the second and third. Deák now proposed that the sovereign himself should break away from counsellors who had sought to oppress Hungary, and should restore the constitution as a personal act. The worthy response to this loyal invitation was the dismissal of the Schmerling administration, the suspension of the February constitution and the summoning of the coronation diet. Of that diet Deák was the indispensable leader. Under his direction the Addressers and the Resolutioners coalesced, and he was entrusted with the difficult and delicate negotiations with the crown, which aimed at effecting a compromise between the Pragmatic Sanction of 1719, which established the indivisibility of the Habsburg monarchy, and the March decrees of 1848. The committee of which he was president had completed its work, when the war of 1866 broke out and all again became uncertain.

After Königrácza the extreme parties in Hungary hoped to effects far more favourable than anything their leaders ever dreamed; but Deák remained true to himself and to the constitutional principle.

On the 18th of July he went to Vienna, to urge the necessity of forming a responsible Magyar ministry without delay. He offered the post of premier to Count Julius Andrassy, but would not himself take any part in the administration. The diet was resumoned on the 17th of November 1866 and, chiefly through the efforts of Deák, the responsible ministry was formed (February 17th, 1867). There was still one fierce parliamentary struggle, in which Deák defended the Composition (Ausgleich) of 1867, both against the Kossuthites and against the Left-centre, which had detached itself from his own party under the leadership of Kálmán Tisza (q.v.). He, a simple citizen, from pure patriotism, thus mediated between the crown and the people, as the Hungarian palatines were wont to do in years gone by, and it was the wish of the diet that Deák should exercise the functions of a palatine at the solemn ceremony of the coronation. This honour he refused, as he had refused every other reward and distinction.
"It was beyond the king's power to give him anything but a clasp of the hand." His real recompense was the assurance of the prosperity and the tranquility of his country in the future, and the reconciliation of the nation and its sovereign. The consciousness of these great services even reconciled him to the loss of much of his popularity; for there can be no doubt that a large part of the Hungarian nation regarded the Composition of 1867 as a sort of surrender and blamed Déak as the author of it. The Composition was the culminating point of Déak's political activity; but as a party-leader he still exercised considerable influence. He died at midnight of the 28th-29th of July 1876, after long and painful sufferings. His funeral was celebrated with royal pomp on the 3rd of February, and representatives from every part of Hungary followed the "Sage" to the grave. A mausoleum was erected by national subscription, and in 1887 a statue, overlooking the Danube, was erected to his memory.

DEAL, a market town, seaport and municipal borough in the St Augustine's parliamentary division of Kent, England, 8 m. N.E. by N. of Dover on the South-Eastern & Chatham railway. Pop. (1901) 10,851. It consists of three divisions—Lower Deal, on the coast; Middle Deal; and, about a mile inland, though formerly on the coast, Upper Deal, which is the oldest part. Though frequented as a seaside resort, the town derives its importance mainly from its vicinity to the Downs, a fine anchorage, between the shore and the Goodwin Sands, about 8 m. long and 6 m. wide, in which large fleets of windbound vessels may lie in safety. The trade consequently consists largely in the supply of provisions and naval stores, which are conveyed to the ships in need of them by "hovellers," as the boatmen are called all along the Kentish coast; the name is probably a corruption of habeler, anciently applied to light- horsemen from the hobby or small horse which they rode. The Deal hovellers and pilots are famous for their skill. Boat-building and a few other industries are carried on. Among buildings the most remarkable are St Leonard's church in Upper Deal, which dates from the Norman period; the Baptist chapel in Lower Deal, formerly the old Taverne, governor of Deal Castle, in 1664, the military and naval hospital; and the barracks, founded in 1795. The site of the old navy yard is occupied by villas; and the esplanade, nearly four miles long, is provided with a promenade pier. The golf-links are well known. At the south end of the town is Deal Castle, erected by Henry VIII. in 1539, together with the castles of Sandown, Walmer and Sandgate. They were built alike, and consisted of a central keep surrounded by four lunettes. Sandown Castle, which stood about a mile to the east of Deal Castle, was of interest as the prison in which Colonel Hutchinson, the Puritan soldier, was confined, and is said to have died, September 1664. It was removed on becoming endangered by encroachments of the sea. The "captain" of Deal Castle is appointed by the lord warden of the Cinque Ports. The town is governed by a mayor, 6 aldermen and 18 councillors.

Area, 1,111 acres.

Deal is one of the possible sites of the landing-place of Julius Caesar in Britain. Later in the period of Roman occupation the site was inhabited, but apparently was not a port. In the Domesday Survey, Deal (Dole, Dole, Dole), forms part of the possessions of St Martin, Dover, as part of the hundreds of Bewsborough and Cornilo; it seems, however, from early times to have been within the liberty of the Cinque Ports as a member of Sandwich, but was not continuously reckoned as a member until Henry VI., on the occasion of a dispute as to its assessment, finally annexed it to their jurisdiction.

In the time of Henry VIII. Deal was merely a fishing village standing half-a-mile from the sea, but the growth of the English navy and the increase of trade brought men-of-war and merchant ships in increased numbers to the Downs. Deal began to grow in importance, and Lower or New Deal was built along the shore. The prosperity of the town has ever since depended almost entirely on its shipping trade. In 1699 the inhabitants petitioned for incorporation, since previously the town had been under the jurisdiction of Sandwich and governed by a deputy appointed by the mayor of that town; William III. by his charter incorporated the town under the title of mayor, jurats and commonality of Deal, and he also granted a market to be held on Tuesday and Saturday, and fairs on the 25th and 26th of March, and on the 30th of September and 1st of October, with a court of Pie Powder. The Cinque Ports were first represented in the parliament of 1625; the two members returned by Sandwich represented Sandwich, Deal and Walmer, until they were disenfranchised by the act of 1885.

DEAL (1) (A common Teutonic word for a part or portion, cf. Ger. Teil, and the Eng. variant "dole"), a division or part, obsolete except in such phrases as "a great deal" or "a good deal," where it equals quantity or lot. From the verb "to deal," meaning primarily to divide into parts, come such uses as for the giving out of cards to the players in a game, or for a business transaction. (2) (Also a Teutonic word, meaning a plank or board, cf. Ger. Dede, Dutch deel), strictly a term in carpentry and joinery for a sawn plank, usually of pine or fir, 9 in. wide and 2 to 4 ft. long, see J oined. The word is also used more loosely of the timber from which such deals are cut, thus "white deal" is used of the wood of the Norway spruce, and "red deal" of the Scotch pine.

DEAN (Lat. decanus, derived from the Gr. ἄδεα, ten), the style of a certain functionary, primarily ecclesiastical. Whether the term was first used among the secular clergy to signify the priest who had a charge of inspection and superintendence over two parishes, or among the regular clergy to signify the monk who in a monastery had authority over ten other monks, appears doubtful. "Decarius" may be found in early writers used to signify the same thing as "decanus," which shows that the word and the idea signified by it were originally borrowed from the old Roman military system.

The earliest mention which occurs of an "archipresbyter" seems to be in the fourth epistle of St Jerome to Rusticus, in which he says that a cathedral church should possess one bishop, one archipresbyter and one archdeacon. Liberatus also (Breviar. c. xiv.) speaks of the office of archipresbyter in a manner which, to the modern mind, makes it quite easy to understand what the whole of his duties and position was. He and he thinks that those are right who hold that the archipresbyters were the same as the deans of English cathedral churches. E. Stillingfleet (Tiren. part ii. c. 7) says of the archipresbyters that "the memory of them is preserved still in cathedral churches, in the chapters there, where the dean was nothing else but the archipresbyter; and both dean and prebendaries were to be assistant to the bishop in the regulating the church affairs belonging to the city, while the churches were contained therein." Bingham, however, following Liberatus, describes the office of the archipresbyter to have been next to that of the bishop, the head of the presbytery college, and the functions to have consisted in administering all matters pertaining to the church in the absence of the bishop. But this does not describe accurately the office of dean in an English cathedral church. The dean is indeed second to the bishop in rank and dignity, and he is the head of the presbytery college or chapter; but his functions in no wise consist in administering any affairs in the absence of the bishop. There may be some matters connected with the ordering of the internal arrangements of cathedral churches, respecting which it may be considered a doubtful point whether the authority of the bishop or that of the dean is supreme. But the consideration of any such question leads at once to the due theoretical distinction between the two. With regard to matters spiritual, properly and strictly so called, the bishop is supreme in the cathedral as far as —and no further than—he is supreme in his diocese generally. With regard to matters material and temporal, as concerning the fabric of the cathedral, the arrangement and conduct of the services, and the management of the property of the chapter, &c., the dean (not excluding the authority of the other members of the chapter, but speaking with reference to the bishop) is
supreme. And the cases in which a doubt might arise are those in which the material arrangements of the fabric or of the services may be thought to involve doctrinal considerations.

The Roman Catholic writers on the subject say that there are two sorts of deans in the church—the deans of cathedral churches, and the rural deans—as has continued to be the case in the English Church. And the probability would seem to be that the former were the successors and representatives of the monastic decurions, the latter of the inspectors of "ten" parishes in the primitive secular church. It is thought by some that the rural dean is the lineal successor of the chorepiscopus, who in the early church was the assistant of the bishop, discharging most, if not all, episcopal functions in the rural districts of the diocese. But upon the whole the probability is otherwise. W. Beveridge, W. Cave, Bingham and Basnage all hold that the chorepiscopi were true bishops, though Romanist theologians for the most part have maintained that they were simple priests. But if the chorepiscopus has any representative in the church of the present day, it seems more likely that the archdeacon is such rather than the dean.

The ordinary use of the term dean, as regards secular bodies of persons, would lead to the belief that the oldest member of a chapter had, as a matter of right, or at least of usage, become the dean thereof. But Bingham (lib. ii. chap. 18) very conclusively shows that such was at no time the case; as is also further indicated by the maxim to the effect that the dean must be selected from the body of the chapter—"Unus de gremio tantum potest eligi et promoveri ad decanatus dignitatem." The duties of the dean in a Roman Catholic cathedral are to preside over the chapter, to declare the decisions to which the chapter may have in its debates arrived by plurality of voices, to exercise inspection over the choir, over the conduct of the capellany, and over the discipline and regulations of the church; and to celebrate divine service on occasion of the greater festivals of the church in the absence or inability of the bishop. With the exception of the last clause the same statement may be made as to the duties and functions of the deans of Church of England cathedral churches.

Deans had also a place in the judicial system of the Lombard kings in the 8th, 9th and 10th centuries. But the office indicated by that term, so used, seems to have been a very subordinate one; and the name was in all probability adopted with immediate reference to the etymological meaning of the word,—a person having authority over ten (in this case apparently) families. L. A. Muratori, in his Italian Antiquities, speaks of the resemblance between the saltarii or xyleumi and the deconi, and shows that the former had authority in the rural districts, and the latter in towns, or at least in places where the population was sufficiently close for them to have authority over ten families. Nevertheless, a document cited by Muratori from the archives of the canons of Modena, and dated in the year 814, recites the names of several "deaneries" (decania), and thus shows that the authority of the dean extended over a certain circumscription of territory.

In the case of the "dean of the sacred college," the connexion between the application of the term and the etymology of it is not so evident as in the foregoing instances of its use; nor is it by any means clear how and when the idea of seniority was first attached to the word. This office is held by the oldest cardinal—i.e. he who has been longest in the enjoyment of the purple, not he who is oldest in years,—who is usually, but not necessarily or always, the bishop of Ostia and Velletri. Perhaps the use of the word "dean," as signifying simply the eldest member of any corporation or body of men, may have been first adopted from its application to that high dignity. The dean of the sacred college is in the ecclesiastical hierarchy second to the pope alone. His privileges and special functions are very many; a compendious account of the principal of them may be found in the work of G. Moroni, vol. xix. p. 168.

There are four sorts of deans of whom the law of England takes notice. (1) The dean and chapter are a council subordinate to the bishop, assistant to him in matters spiritual relating to religion, and in matters temporal relating to the temporalities of the bishopric. The dean and chapter are a corporation, and the dean himself is a corporation sole. Deans are said to be either of the old or of the new foundation—the latter being those created and regulated after the dissolution of the monasteries by Henry VIII. The deans of the old foundation before the Ecclesiastical Commissioners Act 1841 were elected by the chapter on the king's congé d'élire; and the deans of the new foundation (and, since the act, of the old foundation also) are appointed by the king's letters patent. It was at one time held that a layman might be dean; but since 1662 priest's orders are a necessary qualification. Deaneries are sinecures in the old sense, i.e. they are without cure of souls. The chapter formerly consisted of canons and prebendaries, the dean being the head and an integral part of the corporation. By the Ecclesiastical Commissioners Act 1841, it is enacted that "all the members of the chapter except the dean, in every collegiate and cathedral church in England, and in the cathedral churches of St. David and Llandaff, shall be styled canons." By the same act the dean is required to be in residence eight months, and the canons three months, in every year. The bishop is visitor of the dean and chapter. (2) A dean of peculiar is the chief of certain peculiar churches or chapels. He "hath no chapter, yet is presentative, and hath cure of souls; he hath a peculiar, and is not subject to the visitation of the bishop of the diocese." The only instances of such deaneries are Battle (Sussex), Bocking (Essex) and Stanford (Rutland). The deans of Jersey and Guernsey have similar status. (3) The third dean "hath no cure of souls, but hath a court and a peculiar, in which he holdeth plea and jurisdiction of all such ecclesiastical matters as come within his peculiar. Such is the dean of the arches, who is the judge of the court of the arches, the chief court and consistory of the archbishop of Canterbury, so called of Bow Church, where this court was ever wont to be held." (See Arches, COURT OF.) The parish of Bow and twelve others were within the peculiar jurisdiction of the archbishop in spiritual causes, and exempted out of the bishop of London's jurisdiction. They were in 1845 made part of the diocese of London. (4) Rural deans are clergy whose duty is described as being "to execute the bishop's processes and to inspect the lives and manners of the clergy and people within their jurisdiction." (See Phillimore's Ecclesiastical Law.)

In the colleges of the English universities one of the fellows usually holds the office of "dean," and is specially charged with the discipline, as distinguished from the teaching functions of the tutors. In some universities the head of a faculty is called "dean," and in each of these cases the word is used in a name descriptive of the official and social character of the person.

DEAN, FOREST OF, a district in the west of Gloucestershire, England, between the Severn and the Wye. It extends northward in an oval form from the junction of these rivers, for a distance of 50 miles, with an extreme breadth of 10 miles, and still retains its true forest character. The surface is agreeably undulating, its elevation ranging from 120 to nearly 1100 feet, and its sandy peat soil renders it most suitable for the growth of timber, which is the cause of its being a royal forest from time immemorial. It is recorded that the commanders of the Armada had orders not to leave in it a tree standing. In the reign of Charles I. the forest contained 155,537 trees, and, strained for money, the king granted it to Sir John Wyntour for £10,000, and a fee farm rent of £5000. The grant was cancelled by Cromwell; but at the Restoration only 30,000 trees were left, and Wyntour, the Royalist commander, having got another grant, destroyed all but 200 trees fit for navy timber. In 1680 the act was passed to enclose 11,000 acres and plant with oak and beech for supply of the dockyards; and the present forest, though not containing very many gigantic oaks, has six "walks" covered with timber in various stages of growth.

The forest is locally governed by two crown-appointed deputy gavellers to superintend the woods and mines, and four verderers elected by the freeholders, whose office, since the extermination of the deer in 1850, is almost purely honorary. From time immemorial all persons born in the hundred of St Briavel's, who
DEANE—DEATH

have worked a year and a day in a coal mine, become "free miners," and may work coal in any part of the forest not previously occupied. The forest laws were administered at the Speech House, a building of the 17th century in the heart of the forest, where the verderers' court is still held. The district contains coal and iron mines, and quarries of building-stone, which fortunately hardly minimize its natural beauty. Near Coleford and Westbury pit workings of the Roman period have been discovered, and the Romans drew large supplies of iron from this district. The scenery is especially fine in the high ground bordering the Wye (q.v.), opposite to Symond's Yat above Monmouth, and Tintern above Chepstow. St Bravel's Castle, above Tintern, was the headquarters of the forest officials from an early date and was frequented by King John. It is a moated castle, of which the north-west front remains, standing in a magnificent position high above the Wye.

See H. G. Nicholls, Forest of Dean (London, 1858).

DEANE, RICHARD (1610-1653). British general-at-sea, major-general and regicide, was a younger son of Edward Deane of Temple Guiting or Guting in Gloucestershire, where he was born, his baptism taking place on the 8th of July 1610. His family was strongly Puritan and was related to many of those Buckinghamshire families who were prominent in the parliament party. His uncle or great-uncle was Sir Richard Deane, lord mayor of London, 1628-1629. Of Deane's early life nothing is accurately known, but he seems to have had some sea training, possibly on a ship-of-war. At the outbreak of the Civil War he joined the parliament army as a volunteer in the artillery, a branch of the service with which he was constantly and honourably associated. In 1644 he held a command in the artillery under Essex in Cornwall and took part in the surrender after Lostwithiel. Essex (Letter to Sir Philip Stapleton, Rushworth Collection) calls him "an honest, judicious and stout man," an estimate of Deane borne out by Clarendon's "bold and excellent officer" (book xiv. cap. 27), and he was one of the few officers concerned in the surrender who were retained at the remodelling of the army. Appointed comptroller of the ordnance, he commanded the artillery at Naseby and during Fairfax's campaign in the west of England in 1645. In 1647 he was promoted colonel and given a regiment. In May of that year Cromwell was made lord-general of the forces in Ireland by the parliament, and Deane, as a supporter of Cromwell who had to be reckoned with, was appointed his lieutenant of artillery. Cromwell refused to be thus put out of the way, and Deane followed his example. When the war broke out afresh in 1648 Deane went with Cromwell to Wales. As brigadier-general his leading of the right wing at Preston contributed greatly to the victory. On the entry of the army into London in 1648, Deane superintended the seizure of treasure at the Guildhall and Weavers' Hall the day after Pride's Purge. The House of Commons, and accompanied Cromwell to the consultations as to the "settlement of the Kingdom," with Lenthall and Sir Thomas Wildering, the keeper of the great seal. He is rightly called by Sir J. K. Laughton (in the Dict. of Nat. Biog.) Cromwell's "trusted partisan," a character which he maintained in the active and responsible part taken by him in the events which led up to the trial of the King. He was one of the commissioners for the trial, and a member of the committee which examined the witnesses. He signed the death warrant.

Deane's capacities and activities were now required for the navy. In 1649 the office of lord high admiral was put into commission. The first commissioners were Edward Popham, Robert Blake and Deane, with the title of generals-at-sea. His command at sea was interrupted in 1651, when as major-general he was brought back to the army and took part in the battle of Worcester. Later he was made president of the commission for the settlement of Scotland, with supreme command of the military and naval forces. At the end of 1652 Deane returned to his command as general-at-sea, where Monck had succeeded Popham, who had died in 1651. In 1653 Deane was with Blake in command at the battle off Portland and later took the most prominent and active part in the refitting of the fleet on the reorganization of the naval service. At the outset of the three days' battle off the North Foreland, the 1st, 2nd and 3rd of June 1653, Deane was killed. His body lay in state at Greenwich and after a public funeral was buried in Henry VII.'s chapel at Westminster Abbey, to be disinterred at the Restoration.

DEANE, SILAS (1737-1789), American diplomat, was born in Grotton, Connecticut, on the 24th of December 1737. He graduated at Yale in 1758 and in 1761 was admitted to the bar, but instead of practising became a merchant at Wethersfield, Conn. He took an active part in the movements in Connecticut preceding the War of Independence, and from 1774 to 1776 was a delegate from Connecticut to the Continental Congress. Early in 1776 he was sent to France by Congress, in a semi-official capacity, as a secret agent to induce the French government to lend its financial aid to the colonies. Subsequently he became, with Benjamin Franklin and Arthur Lee, one of the regularly accredited commissioners to France from Congress. On arriving in Paris, Deane at once opened negotiations with Vergennes and Beaumarchais; he succeeded in bringing about the shipment of many vessel loads of arms and munitions of war to America. He also enlisted the services of a number of Continental soldiers of fortune, among whom were Lafayette, Baron Johann De Kalb and Thomas Conway. His carefulness in keeping account of his receipts and expenditures, and the differences between himself and Arthur Lee regarding the contracts with Beaumarchais, eventually led, in November 1777, to his recall to face charges, of which Lee's complaints formed the basis. Before returning to America, however, he signed on the 6th of February 1778 the treaties of amity and commerce and of alliance which he and the other commissioners had successfully negotiated. In America he was defended by John Jay and John Adams, and after stating his case to Congress was allowed to return to Paris (1781) to settle his affairs. Differences with various French officials led to his retirement to Holland, where he remained until after the treaty of peace had been signed, when he settled in England. The publication of some "intercepted" letters in Rivington's Royal Gazette in New York (1781), in which Deane declared his belief that the struggle for independence was hopeless and counselled a return to British allegiance, aroused such animosity against him in America that for some years he remained in England. He died on shipboard in Deal harbour, England, on the 23rd of September 1789 after having embarked for America on a Boston packet. No evidence of his dishonesty was ever discovered, and Congress recognized the validity of his claims by voting $37,000 to his heirs in 1842. He published his defence in An Address to the Free and Independent Citizens of the United States of North America (Hartford, Conn., and London, 1784).

DEATH, the permanent cessation of the vital functions in the bodies of animals and plants, the end of life or act of dying. The term is the English representative of the substantive common Teutonic language, as "dead" is of the adjective, and "die" is of the verb; the ultimate origin is the pre-Teutonic verbal stem daw-; cf. Ger Tod, Dutch dood, Swed. och Dan. død.

For the scientific aspects of the processes involved in life and its cessation see Biology, Physiology, Pathology, and allied articles; and for the consideration of the prolongation of life see Longevity. Here it is only necessary to deal with the more primitive views of death and with certain legal aspects.

Ethnology.—To the savage, death from natural causes is inexplicable. At all times and in all lands, if he reflects upon death at all, he fails to understand it as a natural phenomenon; nor in its presence is he awed or curious. Man in a primitive state has for his dead an almost animal indifference. The researches of archaeologists prove that Quaternary Man cared little what became of his fellow-creature's body. And this lack
of interest is found to-day as a general characteristic of savages. The Gosiros of Venezuela bury their dead, they confess, simply to get rid of them. The Galibis of Guiana, when asked the meaning of their curious funeral ceremony, which consists in dancing on the grave, replied that they did it to stamp down the earth. Fuegians, Bushmen, Veddas, show the same lack of concern and interest in the memory of the dead. Even the Eskimos, conspicuous as they are for their intelligence and sociability, save themselves the trouble of caring for their sick and old by wailing them up and leaving them to die in a lonely hut; the Chukches stone or strangle them to death; some Indian tribes give them over to tigers, and the Battas of Sumatra eat them. This indifference is not dictated by any realization that death means annihilation of the personality. The savage conception of a future state is one that involves no real break in the continuity of life as he leads it. If a man dies without being wounded he is considered to be the victim of the sorcerers and the evil spirits with which they consort. Throughout Asia the death of anyone is ascribed to the magicians of some hostile tribe or to the malicious act of a neighbour. A culprit is easily discovered either by an appeal to a local diviner or in torturing some one into confession. In Australia it is the same. Mr Andrew Lang says that "whenever a native dies, no matter how evident it may be that death has been the result of natural causes, it is at once set down that the defunct was bewitched." The Bechuana and all Kaffir tribes believe that death, even at an advanced age, if not from hunger or violence, is due to witchcraft, and blood is required to expiate or avenge it. Similar beliefs are found among the Papuans, and among the Indians of both Americas. The history of witchcraft in Europe and its attendant horrors, so vividly painted in Lecky's *Rise of Rationalism*, are but echoes of this universal refusal of savage man to accept death as the natural end of life. Even to-day the ignorant peasantry of many European countries, Russia, Greece and elsewhere, believe that all disease is the work of demons, and that medicinal herbs owe their curative properties to their being the materialized forms of benevolent spirits.

This animist tendency is a marked characteristic of primitive Man in every land. The savage explains the processes of inanimate nature by assuming that living beings or spirits, possessed of capacities similar to his own, are within the inanimate object. The growth of a tree, the spark struck from a flint, the devastating floods of a river, mean to him the natural actions of beings within the tree, stone or water. And thus too he explains to himself the phenomena of human life, believing that each man has within him a mannikin or animal which dictates his actions in life. This miniature man is the savage's conception of the soul; sleep and trance being regarded as the temporary, death as the permanent, absence of the soul. Each individual is thus deemed to have a dual existence. This "subliminal" self (in modern terminology) has many forms. The Hurons thought that it possessed head, body, arms and legs, in fact that it was an exact miniature of a man. The Nootkas of British Columbia regard it as a tiny man, living in the crown of the head. So long as it stands erect, its possessor is well, but if it falls from its position the misfortunes of ill-health and madness at once assail him. The ancient Egyptian believed in the soul or "double." The inhabitants of Nias, an island to the west of Sumatra, have the strange belief that to everyone before birth is given the choice of a long and heavy or short and light soul (a parallel belief may be found in early Greek philosophy), and his choice determines the length of life. Sometimes the soul is conceived as a bird. The Bororos of Brazil fancy that in that shape the soul of a sleeper passes out of the body during night-time, returning to him at his awakening. The Bella Coola Indians say the soul is covered with a shell and enclosed in an egg and lives in the nape of the neck. If the shell bursts and the soul flies away, the man must die. If however the bird flies away, egg and all, then he faints or loses his reason. A popular superstition in Bohemia assumes that the soul in the shape of a white bird leaves the body by way of the mouth. Among the Battas of Sumatra rice or grain is sprinkled on the head of a man who returns from a dangerous enterprise, and in the latter case the grains are called *padiruma tondi*, "means to make the soul (tondi) stay at home." In Java the new-born babe is placed in a hen-coop, and the mother makes a clucking noise, as if she were a hen, to attract the child's soul. It is regarded by many savage peoples as highly dangerous to arouse a sleeper suddenly, as his soul may not have time to return. Still more dangerous is it to move a sleeper, for the soul on its return might not be able to find the body. Flies and butterflies are forms which the souls are believed by some races to take, and the Estonians of the island of Oesel think that the gusts of wind which whirl tornado-like through the roads are the souls of old women seeking what they can find.

But more widespread perhaps than any belief, from its simplicity doubtless, is the idea that the body's shadow or reflexion is the soul. The Basutos think that crocodiles can devour the shadow of a man cast on the surface of water. In many parts of the world sorcerers are credited with supernatural powers over death by an attack on his shadow. The sick man is considered to have lost his shadow or a part of it. Dante refers to the shadowless spectre of Virgil, and the folklores of many European countries affords examples of the prevalence of the superstition that a man must be as careful of his shadow as of his body. In the same way the reflexion-soul is thought to be subject to a malice of enemies or attacks of beasts and has been the cause of superstitions which in one form or another exist to-day. From the Fijian and Andaman islander who exhibits abject terror at seeing himself in a glass or in water, to the English or European peasant who covers up the mirrors or turns them to the wall, upon a death occurring, lest an inmate of the house should see his own face and have his own speedy demise thus prognosticated, the idea holds its ground. It was probably the origin of the story of Narcissus, and there is scarcely a race which is free from the haunting dread. Lastly the soul is pictured as being a man's breath (anima), and this again has come down to us in literature, evidenced by the fact that the word "breath" has become a synonym for life itself. The "last breath" has meant more than a mere metaphor. It expresses the savage belief that there departs from the dying in the final expiration a something tangible, capable of separate existence—the soul. Among the Romans custom imposed a sacred duty on the nearest relative, usually the heir, to inhale the "last breath" of the dying. Moreover the classics bear evidence to the sanctity with which sentiment surrounded the last kiss; Cicero, in his speech against Verres, saying "Matres ab extremo complexu liberum exclusae: quae nihil aliud orabant nisi ut filiarem extremum spiritum ore expiceret sibi licit." Virgil, too, refers in the Aeneid, iv, 684, to the custom, which survives to-day as a ceremonial practice among many savage and semi-civilized people.

From the inability of the savage in all ages and in all lands to comprehend death as a natural phenomenon, there results a tendency to personify death, and myths are invented to account for its origin. Sometimes it is a " taboo" which has been broken and gives Death power over man. In New Zealand Maui, the divine hero of Polynesia, was not properly baptized. In Australia a woman was told not to go near a tree where a bat lived: she infringed the prohibition, the bat fluttered out, and death resulted. The Ninghoos were dismissed from Paradise and became mortal because one of them bathed in water which had been "tabooed" (Dalton, p. 13). Other versions of the Death-myth in Polynesia relate that Maui stole a march on Night as she slept, and would have passed right through her to destroy her, but a little bird which sings at sunset woke her, she destroyed Maui, and men lost immortality. In India Yama, the god of Death, is assumed, like Maui, to have been the first to "spy out the people to the other world." In the Solomon Islands (Jour. Anth. Inst., February 1881) "Koevari was the author of death, by resuming her cast-off skin." The same story is told in the Banks Islands. The Greek myth (Hesiód, *Works and Days*, 90) alleged that mortals lived " without ill diseases that give death to men " till the cover was lifted from the box of Pandora. This personification of Death has had as a consequence the introduction into the folklore of many lands of stories, often
humorous, of the tricks played on the Enemy of Mankind. Thus Sisyphus fettered Death, keeping him prisoner till rescued by Ares; in Venetian folklore Beppe ties him up in a bag for eighteen months; while in Sicily an innkeeper cops him up in a bottle, and a monk keeps him in his pouch for forty years. The German parallel is Gambling Hansel, who kept Death up a tree for seven years. Such examples might be multiplied unendingly, but enough has been said to show that the attitude of civilized man towards the sphinx-riddle of his end has been in part dictated and is even still influenced by the savage belief that to die is unnatural.

Low—Registration.—The registration of burials in England goes back to the time of Thomas Cromwell, who in 1538 instituted the keeping of parish registers. Statutory measures were taken from time to time to ensure the preservation of registers of burials, but it was not until 1836 (the Births and Deaths Registration Act) that the registration of deaths became a national concern. Other acts dealing with death registration were subsequently passed, and the whole law for England consolidated by the Births and Deaths Registration Act 1874. By that act, the registration of every death and the preservation of the data are entrusted to the clergyman or such person as the Merchant Taylor and the Registrar-General may by order in council direct. When a deceased person dying within a house contains a house information of the death and the particulars required to be registered must be given concerning death where the deceased dies not in a house. Where written notice of the death, accompanied by a medical certificate of the cause of death, is sent to the registrar, information must nevertheless be given and the register signed within fourteen days after the death by the person giving the notice or some other person as required by the act. Failure to give information of death, or to comply with the registrar's requisitions, entails a penalty not exceeding forty shillings, and making false statements or certificates, or forging or falsifying them, is punishable either summarily within six months, or on indictment within three years of the offence. Before burial takes place the clergyman or other person conducting the funeral or religious service must have the registrar's certificate that the death of the deceased person has been duly registered, or else a coroner's order or warrant. Failing the certificate, the clergyman cannot refuse to bury, but he must forthwith give notice in writing to the registrar. Failure to do so within seven days involves a penalty not exceeding ten pounds. Children must not be registered as still-born without a medical certificate or a signed declaration from some one who would have been required, if the child had been born alive, to give information concerning the birth, that the child was still-born and that no medical man was present at the birth, or a coroner's order. The registration of deaths at sea is regulated by the act of 1874, together with the provisions of the Merchant Shipping Act 1854. See also BIRTH AND BURIAL AND BURIAL ACRO. Registers of death are, in law, evidence of the fact of death, and the entry, or a certified copy of it, will be sufficient evidence without a certificate of burial, although it is desirable that it should also be produced.

Presumption of Death.—The fact of death may, in English law, be proved not only by direct but by presumptive evidence. When a person disappears, so that no direct proof of his whereabouts or death is obtainable, death may be presumed at the expiration of seven years from the period when the person was last heard of. It is always, however, a matter of fact for the jury, and the onus of proving the death lies on the party who asserts it. In Scotland, by the Presumption of Life (Scotland) Act 1891, the presumption is statutory. In those cases where people disappear

under circumstances which create a strong probability of death, the court may, for the purpose of probate or administration, presume the death before the lapse of seven years. The question of survivorship, where two or more persons are shown to have perished by the same catastrophe, as in cases of shipwreck, has been much discussed. It was at one time thought that there might be a presumption of survivorship in favour of the younger as against the older, of the male as against the female, &C. But it is now clear that there is no such presumption (In re Alston, 1892, P. 141). This is also the rule in most states of the American Union. The doctrine of survivorship originated in the Roman Law, which had recourse to certain artificial presumptions, where the particular circumstances connected with deaths were unknown. Some of the systems founded on the civil law, as the French code, have adopted certain rules of survivorship.

Civil Death is an expression used, in law, in contradistinction to natural death. Formerly, a man was said to be dead in law (1) when he entered a monastery and became professed in religious; (2) when he abjured the religion; (3) when he was attainted of treason or felony. Since the suppression of the monasteries these means have been replaced with the definition of death in
civil law, and the first distinction has therefore disappeared, though for long after the original reason had ceased to make it necessary grants of life estates were usually made for the terms of a man's natural life. The act abolishing annualities (1623) did away with civil death by abjuration; and the Forfeiture Act 1870, that on attainer for treason or felony.

For the tax levied on the estate of deceased persons, and sometimes called "death duty," see Succession Duty. For the statistics of the death-rate of the United Kingdom as compared with that of the various European countries see United Kingdom. See also the articles Annuity; Capital Punishment; Cremation Insurance; Medical Jurisprudence, &C.

DEATH-WARNING, a term used in psychical research for an intimation of the death of another person received by other than the ordinary sensory channels, i.e. by (1) a sensory hallucination or (2) a massive sensation, both being of telepathic origin. (See Telepathy.) Both among civilized and uncivilized peoples there is a widespread belief that the apparition of a living person is an omen of death; but until the Society of Psychological Research undertook the statistical examination of the question, there were no data for estimating the value of the belief. In 1885 a collection of spontaneous cases and a discussion of the evidence was published under the title Phantasm of the Living, and though the standard of evidence was lower than at the present time, a substantial body of testimony, including many striking cases, was there put forward. In 1889 a further inquiry was undertaken, known as the " Census of Hallucinations," which provided information as to the percentage of individuals in the general population who, at some period of their lives, while they were in a normal state of health, had had "a vivid impression of seeing or being touched by a living being or inanimate object, or of hearing a voice; which impression, so far as they could discover, was not due to any external cause." To the census question about 17,000 answers were received, and after making all deductions it appeared that death coincidences numbered about 30 in 1300 cases of recognized apparitions; or about 1 in 43, whereas if chance alone operated the coincidences would have been expected to be about 1 in 10,000. As a result of the inquiry the committee held it to be proved that "between deaths and apparitions of the dying person a connexion exists which is not due to chance alone." From an evidential point of view the apparition is the most valuable class of death-warning, inasmuch as recognition is more difficult in the case of an auditory hallucination, even where it takes the form of spoken words; moreover, auditory hallucinations coinciding with deaths may be mere knocks, ringing of bells, &c. tactile hallucinations are still more difficult of recognition; and the hallucinations of smell which are sometimes found as death-warnings rarely have anything to associate them specially with the dead person. Occasionally the death-warning is in the form of an apparition of some other person; it may also take the form of a temporary feeling of intense depression or other massive sensation.
DEATH-WATCH—DEBENTURES

BIBLIOGRAPHY.—P. Morcom, Gurney and Myers, Phantoms of the Living (1885); for the Census Report see Proceedings of the Society for Psychical Research, part xxxvi.; see also P. Morcom, Apparitions and Thought Transfer. For a criticism of the results of the Census see E. Parish, Hallucinations and Visualizations, an essay on telepathism and the telepathical Beweismaterials, and Mrs Siddwick’s refutation in Proc. S.P.R. part xxxiii. 589–601. The Journal of the S.P.R. contains the most striking spontaneous cases received from time to time by the society.

DEATH-WATCH, a popular name applied to insects of two distinct families, which burrow and live in old furniture and produce the mysterious “ticking” vulgarly supposed to foretell the death of some inmate of the house. The best known, because the largest, is a small beetle, Anobium striatum, belonging to the family Ptinidae. The “ticking,” in reality a sexual call, like the chirp of a grasshopper, is produced by the beetle rapidly striking its head against the hard and dry woodland. In the case of the smaller death-watches, some of the so-called book-louse of the family Psocidae, the exact way in which the sound is caused has not been satisfactorily explained. Indeed the ability of such small and soft insects to give rise to audible sounds has been seriously doubted; but it is impossible to ignore the positive evidence on the point. The names Atropos divinatoria and Clothilla pulsatoria, given to two of the commoner forms, bear witness both to a belief in a causal connexion between these insects and the ticking, and to the superstition regarding the fateful significance of the sound.

DE BARY, Heinrich Anton (1831–1888), German botanist, was of Belgian extraction, though his family had long been settled in Germany, and was born on the 26th of January 1831, at Frankfort-on-Main. From 1849 to 1853 he studied medicine at Heidelberg, Marburg and Berlin. In 1853 he settled at Frankfort as a surgeon. In 1854 he became privat-docent for botany in Tübingen, and professor of botany at Freiburg in 1855. In 1857 he migrated to Halle, and in 1872 to Sondershausen, where he was the first rector of the newly constituted university, and where he died on the 19th of January 1888.

Although one of his largest and most important works was on the Comparative Anatomy of Fers and Phycomycetes (1877), and notwithstanding his admirable acquaintance with systematic and field botany generally, de Bary will always be remembered as the founder of modern mycology. This branch of botany he completely revolutionized in 1866 by the publication of his celebrated Morphologie und Physiologie d. Pilze, &c., a classic which he rewrote in 1884, and which has had a wide influence on biology. His clear appreciation of the real significance of symbiosis and the dual nature of lichens is one of his most striking achievements, and in many ways he showed powers of generalizing in regard to the evolution of organisms, which alone would have made him a distinguished man. It was as an investigator of the then little-known fungi, however, that de Bary stands out first and foremost among the biologists of the 19th century. He not only laid bare the complex facts of the life-history of many forms, e.g. the Ustilagineae, Peronosporae, Uredinae and many Ascomycetes, treating them from the developmental point of view, in opposition to the then prevailing anatomical method, but he insisted on the necessity of tracing the evolution of each organism from spore to spore, and by his methods of culture and accurate observation brought to light numerous facts previously undreamt of. These his keen perception and insight continually employed as the basis for hypotheses, which in turn he tested with an experimental skill and critical faculty rarely equalled and probably never surpassed. One of his most fruitful discoveries was the true meaning of infection as a morphological and physiological process. He traced this step by step in Physpodilia, Cystopus, Puccinia, and other Fungi, and so placed before the world in a clear light the significance of parasitism. He then showed by his own experiments as a parasitopolist and saprophyte; these were by no means clear in 1860–1870, though he himself had recognized them as early as 1853, as is shown by his work, Die Brandpilze.

These researches led to the explanation of epidemic diseases, and de Bary’s contributions to this subject were fundamental, as witness his classical work on the potato disease in 1861. They also led to his striking discovery of heterocoeism or metacoecism in the Uredineae, the truth of which he demonstrated in wheat rust experimentally, and so clearly that his classical example (1863) has always been confirmed by subsequent observers, though much more has been discovered as to details. It is difficult to estimate the relative importance of de Bary’s astounding accuracy work on the sexuality of the Fungi. He not only described the phenomena of sexuality in Peronosporae and Ascomycetes—Eurotium, Erysiphe, Peziza, &c.—but also established the existence of parthenogenesis and apomony on this basis that it is doubtful if all the combined workers who have succeeded him, and who have brought forward containing hypotheses in opposition to his views, have succeeded in shaking the doctrine he established before modern cytological methods existed.

In one case, at least (Pyromonas confusaria), the most skilful in controversy, with even more, have shown that de Bary described the sexual organs and process accurately. It is impossible here to mention all the discoveries made by de Bary. He did much work on the Chytridiae, Ustilagineae, Exosaeceae and Phalloideae, as well as on that remarkable group the Myxomycetes, or, as he himself termed them, Pyecelllokok, almost every step of which was of permanent value, and started lines of investigation which have proved fruitful in the hands of his pupils. Nor must we overlook the important contributions to algalogy contained in his earlier monograph on the Conjugatae (1888), and investigations on Nostocaceae (1893), Chara (1871), Acanthobularia (1869), &c. de Bary seems to have held aloof from the Bacteriæ for many years, but it was characteristic of the man that, after working at them in order to include an account of the group in the second edition of his book in 1884, he found opportunity to bring the whole subject of bacteriology under the influence of his genius, the outcome being his brilliant Lectures on Bacteriology in 1885. In de Bary’s personal influence was so intense. Every one of his numerous pupils was enthusiastic in admiration of his kind nature and genial criticism, his humorous sarcasm, and his profound insight, knowledge and originality.

DEBENTURES and DEBENTURE STOCK. One of the many advantages incident to incorporation under the English Companies Acts is found in the facilities which such incorporation affords a trading concern for borrowing on debentures or debenture stock. More than five hundred millions of money are now invested in these forms of security. Borrowing was not specifically dealt with by the Companies Acts prior to the act of 1900, but that it was contemplated by the legislature is evident from the act of 1862 for a company, having a register of mortgages and charges. The policy of the legislature in this, as in other matters connected with trading companies, was apparently to leave the company to determine whether borrowing should or should not form one of its objects.

The first principle to be borne in mind is that a company cannot borrow unless it is expressly or impliedly authorized to do so by its memorandum of association. In the case of a trading company borrowing is impliedly authorized as a necessary incident of carrying on the company’s business. Thus a company established for the conveyance of passengers and luggage by omnibus, a company formed to buy and run vessels between England and Australia, and a company whose objects included discounting approved commercial bills, have all been held to be trading companies with an incidental power of borrowing as such to a reasonable amount. A building society, on the other hand, has not inherent power of borrowing (though a limited statutory power was conferred on such societies by the Building Societies Act 1874); nor has a society formed not for gain but to promote art, science, religion, charity or any other useful object. Public companies formed to carry out some undertaking of public utility, such as docks, water works, or gas works, and
DEBENTURES

Governed by the Companies Clauses Acts, have only limited powers of borrowing.

An implied power of borrowing, even when it attaches, is too inconvenient to be relied on in practice, and an express power is always now inserted in a joint stock company's memorandum of association. This power is in the most general terms. It is left to the articles to define the amount to be borrowed, the nature of the security, and the conditions, if any,—such as the sanction of a general meeting of shareholders,—on which the power is to be exercised. Under the Companies Act 1908, § 87, a company cannot exercise any borrowing power until it has fulfilled the conditions prescribed by the act entitling it to commence business: one of which is that the company must have obtained its "minimum subscription." A person who is proposing to lend money to a company must be careful to acquaint himself with any statutory regulations of this kind, and also to see (a) that the memorandum and articles of association authorize borrowing, and (b) that the borrowing limit is not being exceeded, for if it should turn out that the borrowing was in excess of the company's powers and ultra vires, the company cannot be bound, and the borrower's only remedy is against the directors for breach of warranty of authority, or to be surrogated to the rights of any creditors who may have been paid out of the borrowed money.

A company proposing to borrow usually issues a prospectus, similar to the ordinary share prospectus, stating the amount of the issue, the dates for payment, the particulars of the property to be comprised in the security, the terms as to redemption, and so on, and inviting the public to subscribe. Underwriting is also resorted to, as in the case of shares, to ensure that the issue is taken up. There is no objection to a company issuing debentures or debenture stock at a discount, as there is to its issuing its shares at a discount. It must borrow on the best terms its credit will enable it to obtain. A prospectus inviting subscriptions for debentures or debenture stock comes within the terms of the Directors' Liability Act 1880 (re-enacted in Companies Act 1908, § 84), and persons who are parties to it have the onus cast upon them, should the prospectus contain any misstatements, of showing that, at the time when they issued the prospectus, they had reasonable grounds to believe, and did in fact believe, that the statements in question were true; otherwise they will be liable to pay compensation to any person injured by the misstatements. A debenture prospectus is also within the terms of the Companies Act 1908. It must be filed with the registrar of joint stock companies (§ 86) and must contain all the particulars specified in § 81 of the act.

(See Company.)

The usual mode of borrowing by a company is either on debentures or debenture stock. Etymologically, debenture is merely the Latin word debentur.—The first word in a document in common use by the crown in early times admitting indebtedness to its servants or soldiers. This was the germ of a security which has now, with the expansion of joint stock company enterprise, grown into an instrument of considerable complexity.

Debentures may be classified in various ways. From the point of view of the security they are either (1) debentures (simply); (2) mortgage debentures; (3) debenture bonds. In the debenture the security is a floating charge. In the mortgage debenture there is also a floating charge, but the property forming the principal part of the security is conveyed by the company to trustees under a trust deed for the better of the debenture-holders. In the debenture bond there is no security proper: only the covenant for payment by the company. For purposes of title and transfer, debentures are either "registered," or "to bearer" (for purposes of payment, they are either "terminable" or "perpetual") (See Companies Act 1908, § 103).

The Floating Debenture.—The form of debenture chiefly in use at the present day is that secured by a floating charge. By it the company covenants to pay to the holder thereof the sum secured by the debenture on a specified day (usually ten or fifteen years after the date of issue), or at such earlier date as the principal moneys become due under the provisions of the security, and in the meantime the company covenants to pay interest on the principal moneys until payment, or until the security becomes enforceable under the conditions; and the company further charges its undertaking and all its property, including its uncalled capital, with the payment of the amount secured by the debentures. Uncalled capital if included must be expressly mentioned, because the word "property" by itself will not cover uncalled capital which is only property potentially, i.e. when called up. This is the body of the instrument; on its back is endorsed a series of conditions, constituting the terms on which the debenture is issued. Thus the debenture-holders are to rank pari passu with one another against the security; the debenture is to be transferable free from equities between the company and the original holder; the charge is to be a floating charge, and the debenture-holders' moneys are to become immediately repayable and the charges enforceable in certain events: for instance, if the interest is in arrear for (say) two or three months, or if a winding-up order is made against the company, or a resolution for winding up is passed. Other events indicative of insolvency are sometimes added in which payment is to be accelerated. The conditions also provide for the mode and form of transfer of the debentures, the death or bankruptcy of the holder, the place of payment, &c. The most characteristic feature of the security—the floating charge—grew naturally out of a charge on a company's undertaking as a going concern. Such a charge could only be made practicable by leaving the company free to deal with and dispose of its property in the ordinary course of its business—to sell, mortgage, lease, and exchange it as if no charge existed; and this is how the security works. The debenture-holders give the directors an implied licence to deal with and dispose of the property comprised in the security until the happening of any of the events upon which the debenture-holders' money becomes under the debenture conditions immediately repayable. Pinding this the charge is dormant. The licence extends, however, only to dealings in the ordinary course of business. Payment by a company of its just debts is always in the ordinary course of business, but satisfaction by execution levied in invitus is not. This floating form of security is found very convenient both to the borrowing company and to the lender. The company is not embarrassed by the charge, while the lender has a security covering the whole assets for the time being, and can intervene at any moment by obtaining a receiver if his security is imperilled, even though none of the events in which the principal moneys are made payable have happened. If any of them has happened, for instance default in payment of interest, or a resolution by the company to wind up, the payment of the principal moneys is accelerated, and a debenture-holder can at once commence an action to obtain payment and to realize his security. At times a proviso is inserted in the conditions endorsed on the debenture, that the company is not to create any mortgage or charge ranking in priority to or pari passu with that contained in the debentures. Very nice questions of priority have arisen under such a clause. A floating charge created by a company within three months of its being wound up will now be invalid under § 12 of the Companies Act 1908 unless the company is shown to have been solvent at the time, but there is a saving clause for cash paid under the security and interest at 5%.

Trust Deeds. — When the amount borrowed by a company is large, the company commonly executes a trust deed by way of further security. The object of such a trust deed is twofold: (1) it conveys specific property to the trustees of the deed by way of legal mortgage (the charge contained in the debentures is only an equitable security), and it further charges all the remainder of the company's property to the trust deed; (2) it gives the holders of debenture-holders, with appropriate provisions for enabling them, in certain events similar to those expressed in the debenture conditions, to enforce the security, and for that purpose to enter into possession and carry on the business, or to sell it and distribute the proceeds; (2) it organizes the debenture-holders and constitutes in the trustees of the deed a body of experienced business men who can watch over the interests of the debenture-holders and take steps for their protection if necessary. In particular it provides machinery for the calling of meetings of debenture-holders by the trustees,
and empowers a majority of (say) two-thirds or three-fourths in number and value at such meeting to bind the rest to any compromise or arrangement with the company which such majorities may deem beneficial. This is found a very useful power, and may save recourse to a scheme or arrangement first sanctioned under the machinery of the Joint Stock Companies Arrangement Act 1870 (Companies Act 1908, § 120).

Registration of Mortgages and Charges.—A company is bound, under the Companies Act 1862, to keep a register of mortgages and charges, but the register is only open for the inspection of persons who have actually become creditors of the company, not of persons who may be thinking of giving it credit, and the legislature recognizing its inadequacy provided in the Companies Act 1900 (§ 4 of act of 1908) for a public register at Somerset House of all mortgages and charges of certain specified classes by a company. If not registered within twenty-one days from their creation such mortgages and charges are made void—so far as they are securities—against the liquidator and any creditor of the company, but the debenture-holders retain the right of unsanctioned creditors. An extension of the time for registering may be granted by the court, but it will only be without prejudice to the rights of third persons acquired before actual registration. These provisions for registration as amended are contained in the Companies Act 1908 (§ 93).

Debentures Registered and to Bearer.—Debentures are, for purposes of title and transfer, of two kinds:—(1) registered debentures, and (2) debentures to bearer. Registered debentures are transferable only in the books of the company. Debentures to bearer are negotiable instruments and pass by delivery. Coupons for interest are attached. Sometimes debentures to bearer are made exchangeable for registered debentures and vice versa.

Redemption.—A company generally reserves to itself a right of redeeming the security before the date fixed by the debenture for repayment; and accordingly a power for that purpose is commonly inserted in the conditions. But as debenture-holders, who have got a satisfactory security, do not wish to be paid off, the right of redemption is often qualified so as not to arise till (say) five years after issue, and a premium of 5% is made payable by way of bonus to the redeemed debenture-holder. Sometimes the number of debentures to be redeemed each year is limited. The selection is made by drawings held in the presence of the directors. A sinking fund is a convenient means frequently resorted to for redemption of a debenture debt, and is especially suitable where the security is of a wasting character, leaseholds, mining property or a patent. Such a fund is formed by the company setting apart a certain sum each year out of the profits of the company after payment of interest on the debentures. Redeemed debentures may in certain cases be reissued; see Companies Act 1908 (§ 104).

Debenture Stock.—Debenture stock bears the same relation to debentures that stock does to shares. "Debenture stock," as Lord Lindley states (Companies, 5th ed., 195), "is merely borrowed capital consolidated into one mass for the sake of convenience. Instead of each debenture-holder having a separate mortgage, he has a certificate entitling him to a certain sum, being a portion of one large loan." This sum is not uniform, as in the case of debentures, but variable. One debenture-stockholder, for instance, may hold £20 of the debenture stock, another £20,000. Debenture stock is usually issued in multiples of £10 or sometimes of £1, and is made transferable in sums of any amount not involving a fraction of £1. It is this divisibility of stock, whether debenture or ordinary stock, into quantities of any amount, which constitutes in fact its chief characteristic, and its convenience from a business point of view. It facilitates dealing with the stock, and also enables investors with only a small amount to invest to become stockholders. The property comprised in this security is generally the same as in the case of debentures. Debenture stock created by trading companies differs in various particulars from debenture stock created by public companies governed by the Companies Clauses Act. The debenture stock of trading companies is created by a contract made between the company and trustees for the debenture-stockholders. This contract is known as a debenture-stockholders trust deed, and is analogous in its provisions to the trust deed above described as used to secure debentures. By such a deed the company acknowledges its indebtedness to the trustees, as representing the debenture-stockholders, to the amount of the sum advanced, covenants to pay it, and conveys the property by way of security to the trustees with all the requisite powers and provisions for enabling them to enforce the security on default in payment of interest by the company or on the happening of certain specified events evidencing insolvency. The company further, in pursuance of the contract, enters the names of the subsisting stockholders in a register, and issues certificates for the amount of their respective holdings. These certificates have, like debentures, the conditions of the security inscribed on their back. Debenture stock is also issued to bearer. A deed securing debenture stock requires an ad valorem stamp.

Debenture Scrip.—Debentures and debenture stock are usually made payable in instalments, for example 10% on application, 10% on allotment and the remainder at intervals of a few months. Until these payments are complete the securities are not issued, but to enable the subscriber to deal with his security pending completion the company issues to him an interim scrip certificate acknowledging his title and exchangeable on payment of the remaining instalments for debentures or debenture stock certificates. If a subscriber for debentures made default in payment the company could not compel him specifically to perform his contract, the theory of law being that the company could get the loan elsewhere, but this inconvenience is now removed (see § 105 of the Companies Act 1908).

Remedies.—When debenture-holders' security becomes enforceable there are a variety of remedies open to them. These fall into two classes:—(1) remedies available without the aid of the court; (2) remedies available only with the aid of the court.

1. If there is a trust deed, the trustees may appoint a receiver of the property comprised in the security, and they may also sell under the powers contained in the deed, or under § 25 of the Conveyancing Act 1881. Sometimes, where there is no trust deed, similar powers—to appoint a receiver and to sell—are inserted in the conditions inscribed on the debentures.

2. The remedies with the aid of the court are:—(a) an action by one or more debenture-holders on behalf of all for a receiver and to realize the security; (b) an originating summons for sale or other relief, under Rules of Supreme Court, 1883, O. lv. r. 53; (c) an action for foreclosure where the security is deficient (all the debenture-holders must be parties to this proceeding); (d) a winding-up petition. Of these modes of proceeding, the first is by far the most common and most convenient. Immediately on the issue of the writ in the action the plaintiff applies for the appointment of a receiver to protect the security, or if the security comprises a going business, a receiver and manager. In due course the action comes on for judgment, usually on agreed minutes, when the court directs the accounts and inquiries are the holders of the debentures, who is due what, what property is comprised in the security, and gives leave to any of the parties to apply in chambers for a sale. If the company has gone into liquidation, leave must be obtained to commence or continue the action, but such leave in the case of debenture-holders is ex debito justitiae. A debenture-holder action when the company is in winding up is always now transferred to the judge having the control of the winding-up proceedings. The administration of a company's assets in such actions by debenture-holders (debenture-holders' liquidations, as they are called) has of late encroached very much on the ordinary administration of winding up, and it cannot be denied that great hardship is often inflicted by the floating security on the company's unsecured creditors, who find that everything belonging to the company, uncalled capital included, has been pledged to the debenture-holders. The conventional answer is that such creditors might and ought to have inspected the company's register of mortgages and charges. The matter was fully considered by the departmental board of trade committee which reported in July 1906,
but the committee, looking at the business convenience of the floating charge, saw no reason for recommending an alteration in the law.

Reconstruction.—When a company reconstructs, as it often does in these days, the rights of debenture-holders have to be provided for. Reconstructions are mainly of two kinds—(1) by arrangement, under the Joint Stock Companies Arrangement Act 1870, amended in 1900 and 1907, incorporated in act of 1908 (§ 120), and (2) by sale and transfer of assets, either under § 192 of the act of 1908, or under a power in the company's memorandum of association. By the procedure provided under (1) a petition for the sanction of the court to a scheme is presented, and the court thereupon directs meetings of creditors, including debenture-holders, to be held. A three-fourths majority in value of debenture-holders present at the meeting in person or by proxy binds the rest. Debenture-holders claiming to vote must produce their debentures at or before the meeting. Under the other mode of reconstruction—sale and transfer of assets—there is usually a novation, and the debenture-holders accept the security of the new company in the shape of debentures of equivalent value or—occasionally—of fully paid preference shares.

A point in this connexion, which involves some hardship to debenture-holders, may here be adverted to. It is a not uncommon practice for a solvent company to pass a resolution to wind up voluntarily for the purpose of reconstructing. The effect of this is to accelerate payment of the security, and the debenture-holders have to accept their principal and interest only, parting with a good security and perhaps a premium which would have accrued to them in a year or two. The company is thus enabled by its own act to redeem the reluctant debenture-holder on terms more advantageous to itself. To obviate this hardship, it is now a usual thing in a debenture-holders' trust deed to provide—the committee of the London Stock Exchange indeed require it—that a premium shall be paid to the debenture-holders in the event of the security becoming enforceable by a voluntary winding up with a view to reconstruction.

Public Companies.—Public companies, i.e. companies incorporated by special act of parliament for carrying on undertakings of public utility, form a class distinct from trading companies. The borrowing powers of these companies, the form of their debenture or debenture stock, and the rights of the debenture-holders or debenture-stockholders, depend on the joint operation of the companies' own special act and the Companies Clauses Acts 1845, 1863 and 1869. The provisions of these acts as to borrowing, being express, exclude any implicit power of borrowing. The first two of the above acts relate to mortgages and bonds, the last to debenture stock. The policy of the legislature in all these acts is the same, namely, to give the greatest facilities for borrowing, and at the same time to take care that undertakings of public utility which have come to legislative sanction shall not be broken up or destroyed, as they would be if the mortgagees or debenture-holders were allowed the ordinary rights of mortgagees for realizing their security by seizure and sale. Hence the legislature has given them only "the fruit of the tree," as Lord Cairns expressed it. The debenture-holders or the debenture-stockholders may take the earnings of the company's undertaking by obtaining the appointment of a receiver, but that is all they can do. They cannot sell the undertaking or disorganize it by levying execution, so long as the company is a going concern; but this protecting principle of public policy will not be a bar to a debenture-holder, in his character of creditor, presenting a petition to wind up the company, if it is no longer able to fulfil its statutory objects. Railway companies have further special legislation, which will be found in the Railway Companies Powers Act 1864, the Railways Construction Facilities Act 1864 and the Railway Securities Act 1866.

Municipal Corporations and County Councils.—These bodies are authorized to borrow for their proper purposes on debentures and debenture stock with the sanction of the Local Government Board. See the Municipal Corporations Act 1882, the Local Authorities' Loans Act 1875, and the Local Government (England and Wales) Act 1888.

United States.—In the United States there are two meanings of debenture—(1) a bond not secured by mortgage; (2) a certificate that the United States is indebted to a certain person or his assigns in a certain sum on an audited account, or that it will refund a certain sum paid for duties on imported goods, in case they are subsequently exported.

DEBORAH (Heb. for "bee"), the Israelite heroine in the Bible through whose encouragement the Hebrews defeated the Canaanites under Sisera. The account is preserved in Judges iv.—v., and the ode of victory (chap. v.), known as the "Song of Deborah," is held to be one of the oldest surviving specimens of Hebrew literature. Although the text of this Te Deum has suffered (especially in vv. 8-15) its value is without an equal for its historical contents. It is not certain that the poem was actually composed by Deborah (v. 1); verse 7, which can be rendered "until thou didst arise, O Deborah," is indecisive. The poem consists of a series of rapidly shifting scenes; the words are often obscure, but the general drift of the whole can be easily followed. After the enumeration of the defeat of the approach of Yahweh from his seats in Seir and Edom in the (for the help of his people—the language is reminiscent of Ps. Liv. 8) (especially Hab. iii. 3 seq. 12 seq. In the days of Shagar the son of Anath the land had been insecure, the people were disarmed, and neither shield nor spear was to be seen among their forty thousand (cf. 1 Sam. xiii. 19-22, and for the number Josh. iv. 15). Then follows, apparently, a summons to magnify Yahweh. After an apostrophe to Deborah and Barak, the son of Abinoam, the meeting of the clans is vividly portrayed. Ephraim, with Benjamin behind him (for the wording, cf. Hos. v. 8), Machir (here the tribe of Manasseh) and Zebulun, Issachar and Naphtali, pour down into the valley of the Kishon. Not all the tribes were represented. Reuben was wavering, Gilead (i.e. Gadm) remained beyond the Jordan, and Dan's interests were apparently with the sea-going Phenicians (see Dan); their conduct is contrasted with the reckless bravery of Zebulun and Naphtali. Judah is nowhere mentioned; it lay outside the confederation. The Canaanite kings unite at Taanach by Megiddo, an ancient battlefield probably to be identified with Lejjit. The heavens heard the fight against Sisera (cf. the appeal in Josh. x. 12 seq.), a storm rages, and the enemy are swept away in the flood. Meros, presumably on the line of flight, is bitterly cursed for its inaction: "they came not to the help of Yahweh." In vivid contrast to this is the conduct of one of the Kenites: "blessed of all women is Jael, of all the nomad women is she blessed." The poem recounts how the fleeing king craves water, she gives him milk, and (as he drinks) she fells him (perhaps with a tent-peg); "at her feet he sank down, he fell, he lay, where he sank he lay overcome." The last scene paints the mother of Sisera impatiently waiting the king. Her attendants confidently picture him dividing the booty—a maiden or two for each man, and richly embroidered cloth for himself. With inimitable skill the poet suddenly drops the curtain—"so perish thine enemies, all of thine enemies, Yahweh! But let them that love him be as the sun when it rises in its might."

The historical background of this great event is unknown. The Israelite confederation consists of central Palestine with the (east-Jordanic) Machir, and the northern tribes with the exception of Dan and Asher. This has suggested to some an invasion from the coast, or from the north by way of the coast, since had Dan and Asher fallen into the hands of the enemy, this would probably have been referred to in some way. Sisera is scarcely a Semitic name; a "Hittite" origin has been suggested.1 Shagar son of Anath seems equally foreign; the latter is the name of a Syrian goddess and the former recalls Sangara, a Hittite chief of Carchemish in the 9th century. The context suggests that

1 The term "Hittite" is here used as a loose but convenient designation for closely related groups of N. Syria; see HITTITES.
Shamgar is a foreign oppressor (ver. 6), but he appears to have been converted subsequently into one of the "judges" of Israel (12:1), perhaps with the idea of bringing their total up to twelve. This verse version (iv.) contains confusing and conflicting details. Deborah, whose home is placed under "Deborah's palm" between Ramah and Bethel, summons Barak from Kadesh-Naphthali to collect Naphthali and Zebulun, 10,000 strong, and to meet Sisera (who is here the general of a certain Jabin, king of Hazor) at Mt. Tabor. But Sisera marches south to Kishon, and after his defeat flees north through Israelite territory, past Hazor to the neighbourhood of Kadesh. His death, moreover, is differently described (iv. 21, v. 25-27), and Jael "who with inhospitable guile smote Sisera sleeping" (Milton) is guilty of an act which has possibly originated from a misunderstanding of the poem. In the prose narrative Jabin has nothing to do with the fight, whereas in Josh. xi. he is at the head of an alliance of north Canaanite kings who were defeated by Joshua at the waters of Merom. It would seem that certain elements which are inconsistent with the representation in Judg. v. belonged originally to the other battle. Kadesh, for example, might be a natural rallying-place for an attack upon Hazor, and the designation "Jabin" in this instance is probably applied to the attempt to harmonize the two distinct stories. Moreover, Deborah, who is associated with the tribe of Issachar (v. 15), appears to have been confused with Rebekah's nurse, whose tomb lay near Bethel (Gen. xxxv. 5). Some more northly place seems to be required, and it has been pointed out that the name corresponds with Daberath (modern Dabûrîyeh) at the foot of Tabor, on the border of Zebulon and Issachar. At all events, to represent her as a prophetess, judging the people of Israel (iv. 4 seq.), ill accords with both the older account (v.) and the general situation reflected in the earlier narratives in the book of Judges.

For fuller details see G. A. Cooke, History and Songs of Deborah (1892), the commentaries on Judges and the histories of Israel. Cheyney, Crew & Bickell, pp. 440-464, offers many new textual emendations. Paton (Syria and Palestine, p. 138 sqq.) suggests that the battle was against the Hittites (Sisera, a successor of Shamgar). See also L. W. Batten, Journ. Bibl. Lit. (1905) pp. 31-40 (who regards Judg. v. and Josh. xi. as duplicates); Winkler, Gesch. Israelis, ii. 125-135; Kedinscher, u. d. Alle Test. (1) p. 218; and Ed. Meyer, Israeliten, pp. 272 sqq., 487 sqq.

DEBRECZEN, a town of Hungary, capital of the county of Hajdu, 138 m. E. of Budapest by rail. Pop. (1900) 73,351. It is the principal Protestant centre in Hungary, and bear the name of "Calvinistic Rome." Debreczen is one of the largest towns of Hungary, and is situated in the midst of a sandy but fertile plain. It consists of the inner old town, and several suburbs, which stretch out irregularly into the plain. The walls of the old town have given place to a broad boulevard and several open commons, beautifully laid out. The most prominent of its public buildings is the principal Protestant church, built at the beginning of the 17th century, which ranks as the largest in the country, but has no great architectural pretensions. In its immediate neighbourhood is the Protestant College, for theology and law, which is one of the most frequented institutions of its kind in Hungary, being attended by over two thousand students. This college was founded in 1531, and possesses a rich library and other scientific collections. In the town hall, the Franciscan church, the Piarist monastery and college, and the theatre are also worthy of mention. Amongst its educational establishments it includes an agricultural academy. The industries of the town are various, but none is of importance enough to give it the character of a manufacturing centre. Its tobacco-pipes, sausages and soap are widely known. It carries on an active trade in cattle, horses, corn and honey, while four well-attended fairs are held annually. The municipality of Debreczen owns between three hundred and four hundred square miles of the adjoining country, which possesses all the characteristics of the Hungarian puszta, and on which roam large herds of cattle. The town is of considerable antiquity, but owes its development to the refugees who fled from the villages plundered by the Turks in the 15th century. In 1552 it adopted the Protestant faith, and it had to suffer in consequence, especially when it was captured in 1686 by the imperial forces. In 1693 it was made a royal free city. In 1848-1849 it formed a refuge for the national government and legislature when Budapest fell into the hands of the Austrians; and it was in the great Calvinist church that, on Kosuth's motion (April 14th, 1849) the resolution was passed declaring the house of Habsburg to have forfeited the crown of St Stephen. On the 3rd of July the town was captured by the Russians.

DEBT (Lat. debitum, a thing owed), a definite sum due by one person to another. It may be created by contract, by statute or by judgment. Putting aside those created by statute, recoverable by civil process, debts may be divided into three classes, (1) judgment debts, (2) specialty debts, and (3) simple contract debts. As to judgment debts, it is sufficient to say that, when by the judgment of a court of competent jurisdiction an order is made that a sum of money be paid by one of two parties to another, such a debt is not only enforceable by process of court, but it can be sued upon as if it were an ordinary debt. A specialty debt is created by deed or instrument under seal. That is to say, the debtor undertakes to pay the creditor by law over simple contract debts in the event of the bankruptcy or death of the debtor, but this was abolished by the Administration of Estates Act of that year. The main difference now is that a specialty debt may, in general, be created without consideration, as for example by a bond (a gratuitous promise under seal), and that a right of action arising out of a specialty debt is not barred if exercised any time within twenty years, whereas a right of action arising out of a simple contract debt is barred unless exercised within six years. (See Limitation, Statutes Of.) Any other debt than a judgment or specialty debt, whether evidenced by writing or not, is a simple contract debt. There are also certain liabilities or debts which, for the convenience of the remedy, have been made to appear as though they sprang from contract, and are sometimes termed quasi-contracts. Such would be an admission by one who is in account with another that there is a balance due from him. Such an admission implies a promise to pay when requested and creates an actionable liability ex contractu. Or, when one person is compelled by law to discharge the legal liabilities of another, he becomes the creditor for the person for the money so paid. Again, when a person has received money under circumstances which disentitle him to retain it, such as receiving payment of an account twice over, it can generally be recovered as a debt. At English common law debts and other choses in action were not assignable (see Crosse), but by the Judicature Act 1873 any absolute assignment of any debt or other legal chose in action, of which express notice in writing is given to the debtor, trustee or other person from whom the assignor would have been entitled to receive or claim such debt, is effectual in law. Debts do not, as a general rule, carry interest, but such an obligation may arise either by agreement or by mercantile usage or by statute. The discharge of a debt may take place either by payment of the amount due, by accord and satisfaction, i.e. acceptance of something else in discharge of the liability, by set-off (q.v.), by release or under the law of bankruptcy (q.v.). It is the duty of the debtor to pay a debt without waiting for any demand, and unless there is a place fixed on either by custom or agreement, he must seek out his creditor for the purpose of paying him unless he is "beyond the seas." Payment by a third person to the creditor is no discharge of a debt, as a general rule, unless the debtor subsequently ratifies the payment. When a debtor tenders the amount due to his creditor and the creditor refuses to accept, the debt is not discharged, but if the debtor is subsequently sued for the debt and continues willing and ready to pay, and pays the amount tendered into court, he can recover his costs in the action. A creditor is not bound to give change to the debtor, whose duty it is to make tender in lawful money the whole amount due, or more, without asking for change. (See Payment.) A debtor takes the risk if he makes payment through the post, unless the creditor has requested or authorized that mode of
payment. The payment of a debt is sometimes secured by one person, called a surety, who makes himself collaterally liable for the debt of the principal. (See GUARANTEE.) The ordinary method of enforcing a debt is by action. Where the debt does not exceed £100 the simplest procedure for its recovery is that of the county court, but if the debt exceeds £100 the creditor must proceed in the high court, unless the cause of action has arisen within the jurisdiction of certain inferior courts, such as the mayor's court of London, the Liverpool court of passage, &c. When judgment has been obtained it may be enforced either by process (under certain conditions) against the person of the debtor, by an execution against the debtor's property, or, with the assistance of the court, by attaching any debt owed to the debtor by a third person. Where a debtor has committed any act of bankruptcy a creditor or creditors whose aggregate claims are not less than £30 may proceed against him in bankruptcy (q.v.). Where the debtor is a company or corporation registered under the companies acts, the creditor may petition to have it wound up. (See COMPANY.)

Imprisonment for debt, the evils of which have been so graphically described by Dickens, was abolished in England by the Debtor's Act 1869, except in the case of bankrupts. In cases of committal by writ or otherwise, for solicitors and certain other cases, but in cases where a debt or instalment is in arrear and it is proved to the satisfaction of the court that the person making default either has or has had since the date of the order or judgment the means to pay the sum in respect of which he has made default and has refused or neglected to pay, he may be committed to prison at the discretion of the judge for a period of not more than forty-two days. In practice, a period of twenty-one days is usually the maximum period ordered. Such an imprisonment does not operate as a satisfaction or extinguishment of the debt, and no second order of commitment can be made against him for the same debt, although the court has made an order or judgment for the payment of the debt by instalments a power of committal arises on default of payment of each instalment. In Ireland imprisonment for debt was abolished by the Debtor's Act (Ireland) 1872, and in Scotland by the Debtor's (Scotland) Act 1880. In France it was abolished in 1867, in Belgium in 1871, in Switzerland and Norway in 1874, and in Italy in 1872. In that year the Swiss parliament for debt was abolished under the common law, but it has been abolished in every state, except in certain cases, as where there is any suspicion of fraud or where the debtor has an intention of removing out of the state to avoid his debts. (See also CONTRACT; BANKRUPTCY.)

DEBUSSY, CLAUDE ACHILLE (1862- ), French composer, was born at St Germain-en-Laye on the 22nd of August 1862, and educated at the Paris Conservatoire under Marmontel, Lavignac, Massenet and Guiraud. There between 1874 and 1884 he gained many prizes for solfège, pianoforte playing, accompanying, counterpoint and fugue, and, in the last-year named, the coveted Grand Prix de Rome by means of his cantata L'Enfant prodigue. In this composition already were to be noticed the germs of unusual and "new" talent, though in the light of later developments it is not very easy to discern them, for then Debussy had not come under the influence which ultimately turned his mind to the system he afterwards used, not only with peculiar distinction but also with particular individual and complete success. Nevertheless, the mind had clearly been prepared by nature for the reception of this influence when it should arise; for, in order to fulfil that condition of the Prix de Rome which entails the submitting periodically of compositions to the judges, Debussy sent to them his symphonic suite Prélèvement, to which the judges took exception on the ground of its formlessness. Following in the wake of Prélèvements came La domoiseille élue for solo, female voice and orchestra—a setting of a French version of Rossetti's "The Blessed Damozel"—which in the eyes of the judges was even more unorthodox than its predecessor, though, be it said, fault was found as much with the libretto as with the music. Both works were denied the customary public performance.

The Rome period over, Debussy returned to Paris, whence shortly he went to Russia, where he came directly under the influence referred to above. In Russia he absorbed the native music, especially that of Moussorgsky, who, recently dead, had left behind him the reputation of a "musical nihilist," and on his return to Paris Debussy devoted himself to composition, the stream of his muse being even in 1908 as fluent as twenty years before. To him public recognition was slow in coming, but in 1893 the Société Nationale de Musique performed his Dôme de l'âge ébloui, in 1894 the Yesaye Quartet introduced the string quartet, while in the same year the Prélude à l'apres-midi d'un faune was heard, and brought Debussy's name into some prominence. As time passed the prominence grew, until the climax of Debussy's creative career was reached by the production at the Opéra Comique on the 30th of April 1902 of his masterpiece Pelléas et Mélisande. Herein lay the whole strength of Debussy's system, the perfection of his appeal to the mind and imagination as well as to the emotions and senses. Since its production the world has been enriched by La Mer, and by the Ariettes oublées, but the lyric drama remains on its own lofty pedestal, a monument of elusive and subtle beauty, of emphatic originality and of charm. In an Apologia Debussy has declared that in composing Pelléas he "wanted to dispense with parasitic musical phrases. Melody is, if I may say so, almost anti-lyric, and powerless to express the constant change of emotion or life. Melody is suitable only for the chanson, which confers a fixed sentiment. I have never been willing that my music should hinder, through technical exigencies, the change of sentiment and passion felt by my characters. It is effaced as soon as it is necessary that these should have perfect liberty in their gestures or in their cries, in their joy, or in their sorrow."

The list of Debussy's works is a lengthy one. Several of them have been referred to already. Among the others, of which the complete list is too long to print here, are the dances for chromatic harp or pianoforte; Images; incidental music to King Lear; the Petite Suite; Trois Nocturnes; innumerable songs, as Proses lyriques (text by Debussy); two series of Verlaine's Pêlles galantes; Cinq Poèmes de Baudelaire; many pianoforte pieces. In 1891 Debussy was appointed critic of the Revue Blanche. In his first notice he expressed his faith thus: "I shall endeavor to trace in a musical work the many different emotions which have helped to give it birth, also to demonstrate its inner life. This, surely, will be accounted of greater interest than the game which consists in dissecting it as if it were a curious timepiece."

As to the theories, so much debated, of this remarkable musician—probably in the whole range of musical history there has not appeared a more difficult theorist to "place." Unquestionably Debussy has introduced a new system of colour into music, which has begun already to exert widespread influence.

Roughly, Debussy's system may be summarized thus:

- His scale basis is of six whole tones (enharmonic), as (1) middle C, D, E, Gb, Ab, Bb, which are of excellent sound when superimposed in the form of two augmented unrelated triads.

- By directly
  - A#  G#  F#  D  D
  - Ab  E  E  C  C

- Used frequently incomplete (i.e. by the omission of one note) by Debussy.

Now, upon the basis of an augmented triad a tune may be played above it provided that it be based upon the six-tone scale, and a fugue may be written, the re-entry of the subject of which may be made upon any note of the scale, and the harmony will be complete. To associate this scale with the ordinary diatonic scale let a major qth be taken, e.g.: one may conventionally:

- Flatten or sharpen the fifth of this (A becoming # or b as desired): if both the flattened and sharpened fifths be taken in the one chord this chord is arrived at:
which is composed of the notes of the aforesaid scale (1), and
Debussy therefore proves his case to belong to the “primitifs.”
It will be noticed that chords of the 9th in sequence and in all
forms occur in Debussy’s music as well as the augmented triad
harmonics, where the melodic line is based on the tontal scale.
This, in all likelihood, is the outcome of Debussy’s instinctive
feeling for the association of his so-called discovery with the
ordinary scale. The “secret,” it may be added, comes not
from Annamese music as has been frequently stated, but probably
from Russia, where certainly it was used before Debussy’s rise.
(R. H. L.)

**DECADE** (from Gr. δέκα, ten), a group or series containing ten
members, particularly a period of ten years. In the new calendar
made at the time of the French Revolution in 1793, a decade
of ten days took the place of the week. The word is also used of the
divisions containing ten books or parts into which the history
of Livy was divided.

**DECAEN, CHARLES MATHEU BIDORE.** Count (1769–
1832), French soldier, was born at Caen on the 13th of April
1769. He was educated for the bar, but soon showed a strong
preference for the military career, in which he quickly made his
way during the wars of the French Revolution under Kleber,
Marceau and Jourdan, in the Rhenish campaigns. In 1799 he
became general of division, and contributed to the success of
the famous attack by General Richepanse on the Austrian flank
and rear at Hohenlinden (December 1800). Becoming known for
his Anglophobe tendencies, he was selected by Napoleon early in
the year 1802 for the command of the French possessions in the
East Indies. The secret instructions issued to him bade him
prepare the way, so that in due course (September 1804 was
hurried at as the suitable time) everything might be ready for an
attack on the British power in India. Napoleon held out to him
the hope of acquiring lasting glory in that enterprise. Decaen
set sail with Admiral Linois early in March 1805 with a small
expeditionary force, touched at the Cape of Good Hope (then in
Dutch hands), and noted the condition of the fortifications there.
Upon arriving at Pondicherry he found matters in a very critical
condition. Though the outbreak of war in Europe had not yet
been heard of, the hostile preparations adopted by the Marquis
Wellesley caused Decaen to withdraw promptly to the Isle of
France (Mauritius), where, during eight years, he sought to harass
British trade and prepare for plans of alliance with the Maharatta
princes of India. They all came to naught. Linois was captured
by a British squadron, and ultimately, in 1811, Mauritius itself
fell to the Union Jack. Returning to France on honourable
terms, Decaen received the command of the French troops in
Tahiti. The rest of his career calls for no special mention.
He died of the cholera in 1832.

See M. L. E. Gautier, *Biographie du général Decaen* (Caen,
1850).

**DECALOGUE** (in patristic Gr. ἡ δεκάλογος, sa. βιβλία
or νομοθεσία), another name for the biblical Ten Commandments,
in Hebrew the Ten Words (Deut. iv. 13, x. 4; Ex. xxxiv. 28),
written by God on the two tables of stone (Ex. xxiv. 12, xiii.
16), the so-called Tables of the Revelation (E. V. “tables of testi-
momy,” Ex. xxxiv. 29), or Tables of the Covenant (Deut. iv. 9, 11,
15). These tables were broken by Moses (Ex. xxxii. 19), and
and upon them were written the words of the covenant by Moses (xxxiv. 27 sqq.) or, according to another
view, by God himself (Deut. iv. 13, ix. 10). They were
deposited in the Ark (Ex. xxv. 21; 1 Kings viii. 9).

In Deuteronomy the inscription on these tables, which is briefly called the
covenant (iv. 13), is expressly identified with the words spoken by
Jehovah (Yahweh) out of the midst of the fire at Mt Sinaí or
Horeb (according to the Deuteronomic tradition), in the ears of
the whole people on the “day of the assembly,” and rehearsed
in v. 61. In the narrative of Exodus the relation of the “ten
words” of xxxiv. to the words spoken from Sinai, xx. 2-17, is
not so clearly indicated, and it generally agreed that the
Pentateuch presents divergent and irreconcilable views of the
Sinaic covenant.

As regards the Decalogue, as usually understood, and embodied
in the parallel passages in Ex. xx. and Deut. v., certain pre-
liminary points of detail have to be noticed. The variations
in the parallel texts are partly verbal, partly stylistic (e.g.
“Remember the Sabbath day,” Ex.; but “observe,” &c.,
Deut.), and partly consist of amplifications or divergent explana-
tions. Thus the reason assigned for the institution of the Sabbath
in Exodus is drawn from the creation, and agrees with Gen. ii. 3.
In Deuteronomy the command is based on the duty of humanity
to servants and the memory of Egyptian bondage. Again, in the
tenth commandment, as given in Exodus, “house” means house
and household, including the wife and all the particulars which
are enumerated in ver. 17. In Deuteronomy, Thou shalt not covet
thy neighbour’s wife,” comes first, and “house” following in
association with field is to be taken in the literal restricted sense,
and another verb (“thou shalt not desire”) is used.

The construction of the second commandment in the Hebrew
text can be detected, but the nature seems to be, “Thou
shall not make unto thee a graven image; and (to no visible
shape in heaven, &c., shalt thou bow down, &c.” The third
commandment might be rendered, “Thou shalt not utter the
name of the Lord Thy God vainly,” but it is possible that the
meaning is that Yahweh’s name is not to be used for purposes
of sorcery.

The order of the commandments relating to murder, adultery and
stealing varies in the Vatican text of the Septuagint, viz. adultery,
stealing, murder, in Ex.; adultery, murder, stealing, in Deut.
The latter is supported by several passages in the New Testament
(Rom. xiii. 9; Mark x. 19, A.V.; Luke xviii. 20; contrast Matt. xix. 18),
and by the “Nash Papyrus.” It may be added that the double system
of accentuation of the Decalogue in the Hebrew Bible seems to
preserve traces of the ancient uncertainty concerning the numeration.

**Divisions of the Decalogue.**—The division current in England and
Scotland, and generally among the Reformed (Calvinistic)
churches and in the Orthodox Eastern Church, is known as the
Philonian division (Philo, de Decalogu, §12). It is sometimes called
by the name of Origen, who adopts it in his *Homilies on Exodus.
On the whole, the scheme seems to have been taken
ex. xx. 2, has been taken
as part of the first commandment. The Church of Rome and
the Lutherans adopt the Augustinian division (Aug., *Quaest. super
Exod., Ixxi.), combining into one the first and second command-
ments of Philo, and splitting his tenth commandment into two.
To gain a clear distinction between the ninth and tenth com-
domments on this scheme it has usually been felt to be necessary
to follow the Deuteronomic text, and make the ninth command-
ment, Thou shalt not covet thy neighbour’s wife. As few scholars will
now claim priority for the text of Deuteronomy, this division may
be viewed as exploded. But there is a third scheme (the Talmudic
law, still current among the Jews, and not unknown to early Christian
writers, which is still a rival of the Philonic view, though less
satisfactory. Here the preface, Ex. xx. 2, is taken as the first
“word,” and the second embraces verses 3-6.

See further Nestle, *Expository Times* (1897), p. 427. The decision
between Philo and the Talmud must turn on two questions. Can
the Hebrew text be rendered “precept” instead of “law,” and
toward the prohibition of polytheism and the prohibition of idolatry as
one commandment? Now, though the Hebrew certainly speaks of
ten words, “not of ten precepts,” it is most unlikely that the first
word is to be different in character from those that follow. But the
statement “I am the Lord Thy God” is either no precept at all, or
only enjoins by implication what is expressly commanded in the
following precepts. The use of the second word is in the tenth
conic, originalis.

1 In a Hebrew fragment, 2nd century A.D., in the
University Library, Cambridge, containing the Decalogue with
several variant readings; see S. A. Cook, *Proced. Soc. Bibl. Archae-
ology* (1907), p. 45; P. C. Burkitt, *Journal Quarterly Review* (1903),

2 So, for example, Augustine, *Lc., Thomas, Summa (Prima
Secundae, qu. c. art. 4), and recently Sonntag and Kurtz, Purely
arbitrary is the idea of Lutheran writers (Gerhard, *Loc. xii. 4, 6).
The ninth commandment forbids *concipicionem actualit*, the
tenth conc. originalis.
DECALOGE

words "Thou shalt have no other gods before me." Thus to take the preface as a distinct word is not reasonable unless there are cogent grounds for uniting the commandments against polytheism and idolatry. But that is far from being the case. The first precept of the Decalogue does not merely show the moral aspect, it has a spiritual and transcendental nature. Accordingly Kuenen does not deny that the prohibition of images contains an element additional to the precept of monolatry, but, following De Goeje, regards the words "from henceforth thou shalt not make unto thee a graven image" as an insertion in the original Decalogue. Unless this can be made out, the Philonic scheme is clearly best, and as such it is now accepted by most scholars.

How were the ten words disposed on the two tables? The natural arrangement (which is assumed by Philo and Josephus) would be five and five. And this, as Philo recognized, is a division appropriate to the sense of the precepts; for antiquity did not look upon piety towards parents as a mere precept of probity, part of one's duty towards one's neighbour. The authority of parents and rulers is viewed in the Old Testament as delegated divine authority, and the violation of it is akin to blasphemy (cf. Ex. xxi. 17 and Lev. xx. 9 with Lev. xxiv. 15, 16, and note the formula of treason, 1 Kings xxi. 13).

We have thus five precepts of piety on the first table, and five of probity, in negative form, on the second, an arrangement which is accepted by the best recent writers. But the current view of the Western Church since Augustine has been that the precept to honour parents heads the second table. The only argument of weight in favour of this view is that it makes the amount of writing on the two tables less unequal, while we know that the second table as well as the first was written on both sides (Ex. xxi. 12). But we shall presently see that there may be another way out of this difficulty.

Date.—It is much disputed what the original compass of the Decalogue was. Did the whole text of Ex. xx. 2-17 stand on the tables of stone? The answer to this question must start from the reason annexed to the fourth commandment, which is different in Deuteronomy. But the express words "and he added no more," in Deut. v. 22, show that there is no conscious omission by the Deuteronomic speaker of part of the original Decalogue, which cannot therefore have included the reason annexed to Exodus. On the other hand the reason annexed in Deuteronomy is rather a parenetic addition than an original element dropped in Exodus. Thus the original fourth commandment was simply "Remember the Sabbath day to keep it holy." When this is granted it must appear not improbable that the elucidations of other commandments may not have stood on the tables, and that Nos. 6-9 have survived in their original form. Thus in the second commandment, "Thou shalt not bow down to any visible form," &c., is a sort of explanatory addition to the precept "Thou shalt not make unto thee a graven image." And so the promise attached to the fifth commandment was probably not on the tables, and the tenth commandment may have simply been, "Thou shalt not covet thy neighbour's house," which includes all that is expressed in the following clauses. Such a view gets over the difficulty arising from the unequal length of the two halves of the Decalogue.

It is quite another question whether there is any idea in the Decalogue which can be as old as Moses. It is urged by many critics that Moses cannot have prohibited the worship of Yahweh by images; for the subsequent history shows us a descendant of Moses as priest in the idolatrous sanctuary of Dan. There were teraphim in David's house, and the worship of Yahweh under the image of a calf was the state religion of the kingdom of Ephraim. Even Moses himself is said to have made a brazen serpent which, down to Hezekiah's time, continued to be worshipped at Jerusalem. It is argued from these facts that image-worship went on unchallenged, and that this would not have been possible had Moses forbidden it. The argument is supported by others of the literary and historical problems of the chapters which narrate the law-giving on Mt. Sinai are extremely intricate, it is generally agreed that Ex. xx. cannot be ascribed to the oldest source, and if, in accordance with many critics, this chapter is ascribed to the Elohist or Priestly school, its incorporation can scarcely be older than the middle of the 8th century, and is probably later. With this, the condemnation of adultery in Gen. xxi. 17 (contrast xii. 10-20, xxvi. 6-11) is in harmony, and the prohibition of the worship of the heavenly bodies is aimed at a form of idolatry which is frequently alluded to in the times of the later kings. The lofty ethics (e.g. tenth commandment) is in itself no sound criterion, whilst the external form of the laws, though characteristic of later codes, need not be taken as evidence of importance. But the general result of a study of the Decalogue as a whole, in connexion with Israelite political history and religion, strongly supports, in fact demands, a post-Mosaic origin, and modern criticism is chiefly divided only as to the approximate date to which it is to be ascribed. The time of Manasseh (cf. especially its contact with Micah vi. 6-8) has found many adherents, but an earlier period, about 750 B.C. (time of Amos and Hosea), is often held to satisfy the main conditions; the former, however, is probably nearer the mark.

The Decalogue of Exodus xxxv.—In the book of Exodus the words written on the tables of stone are nowhere expressly identified with the ten commandments of chap. xx. In xxv. 16, xxxi. 18, xxiii. 15, we simply read of "the testimony" inscribed on the tables, and it seems to be assumed that its contents must be already known to the reader. The expression "ten words" first occurs in xxxiv. 28, in a passage which relates the restoration of the tables after they had been broken. But these "ten words" are called "the words of the covenant," and so can hardly be different from the words mentioned in the preceding verse as those in accordance wherewith the covenant was made with Israel. And again, the words of ver. 27 are necessarily the commandments which immediately precede in vv. 12-26. Accordingly many recent critics have sought to show that Ex. xxxiv. 12-26 contains just ten precepts forming a second decalogue.

These consist not of precepts of social morality, but of several laws of religious observance closely corresponding to the religious and ritual precepts of Ex. xi-xiii. The number ten is not clearly made out, and the individual precepts are somewhat variously assigned. They prohibit (1) the worship of other gods, (2) the making of molten images; they ordain (3) the observance of the feast of unleavened bread, (4) the feast of weeks, (5) the feast of ingathering at the end of the year, and (6) the seventh-day rest; to Yahweh belong (7) the firstlings, and (8) the first-fruits of the land; they forbid also (9) the offering of the blood of sacrifice with leaven, (10) the leaving-over of the fat of a feast until the morning, and (11) the seething of a kid in its mother's milk. This scheme ignores the command to appear thrice in the year before Yahweh which recapitulates Nos. 3-5, and the decade is obtained by omitting No. 6, which some hold to be out of place. Others include "none shall appear before me empty-handed" (xxxiv. 20), and unite Nos. 4-5, 9 and 10. C. F. Kent (Beginnings of Heb. Hist. pp. 183 sqq.) obtains a decalogue from scattered precepts in Ex. xxi-xiii., which corresponds with Nos. 1-5 (in one), 9 and 10 (in one), 11 above, and adds (a) the building of an altar of earth (xx. 24), (b) offering from the harvest and wine-press (xxii. 29), (c) firstlings of animals (xxii. 29 sqq.; cf. No. 7, and xxxiv. 19); (d) prohibition against eating torn flesh (xxii. 35). The so-called Yahwist Decalogue in xxxiv. presupposes a rather more primitive stage in society, partly nomadic and partly agricultural; No. 6 is suitable only for agriculturists and cannot have originated among nomads. The whole may be summed up in a sentence:—"Worship Yahweh and Yahweh alone, without images, let the worship be simple and in accord with the old usage; forbear to introduce the practices of your Canaanite neighbours." (Harper,) It would seem to represent more precisely a Judaean standpoint (cf. the simpler customs of the Rechabites, q.v.).

2 So Hitzig ("Östern und Pfingsten im zweiten Dekalog," Heidelberg, 1888), independently of a previous suggestion of Goeth's in 1783, who in turn appears to have been anticipated by an early Greek writer (cf. Zeit. für Altertumskunde, 1904, pp. 134 sqq.).

DE CAMP—DECAPOLIS

If such a system of precepts was ever viewed as the basis of the covenant with Israel, it must belong to a far earlier stage of religious development than that of Ex. xx. This is the position adopted by Wellhausen, who says that severe decalogue stands to that of Ex. xx. as the order of one group of laws to his contemporaries, whose whole religious law lay in the observance of sacred feasts. To those accustomed to look on the Ten Words written on the tablets of stone as the very foundation of the Mosaic law, it is hard to realize that in ancient Israel there were two opinions as to what these "Words" were. The hypothesis that Ex. xxxiv. 10-26 originally stood in a different connexion, and was misplaced at some stage in the redaction of the Hexateuch, does not help us, since it would still have to be admitted that the editor to whom we owed the present form of the chapter identified this little code of religious observances with the Ten Words. Were this the case the editor, to quote Wellhausen, "introduced the most serious internal contradiction found in the Old Testament."

The Decalogue in Christian Theology.—Following the New Testament, in which the "commands" summed up in the law of love are identified with the precepts of the Decalogue (Mark x. 19; Rom. xiii. 5; cf. Mark xii. 28 [Old Testament]), the ancient Church emphasized the personal relation of the ten commandments to the personal knowledge of divine will. The Decalogue is characteristic of the Decalogue in ceremonial precepts, though the observance of the Sabbath was to be taken in a spiritual sense (Augustine, De spiritu et littera, xiv.; Jerome, De celebratone Paschae). The medieval theologians followed in the same line, recognizing all the precepts of the Decalogue as moral precepts de lege naturae, though the law of the Sabbath is not of the law of nature, in so far as it prescribes a determinate day of rest (Thomas, summar., i. 109 II. de, qu. c. art. 3; Duns, Super sententiaris, lib. iii. dist. 37). The most important medieval exposition of the Decalogue is that of Nicolaus de Lyra; and the 15th century, in which the Decalogue acquired special importance in the confessional, was prolific in treatises on the subject (Antoninus of Florence, Gerson, &c.).

Important theological controversies on the Decalogue begin with the Reformers. The question between the Lutheran (Augustinian) and Reformed (Philonic) divisions of the ten commandments was mixed up with controversy as to the legitimacy of sacred images not designed to be worshipped. The Reformed theologians took the stricter view. The identity of the Decalogue with the eternal law of nature was maintained in both churches, but it was an open question whether the Decalogue, as such (that is, as a law given by Moses to the Israelites), is of perpetual obligation. The Socinians, on the other hand, regarded the Decalogue as abrogated by the more perfect law of Christ; and this view, especially in the shape that the Decalogue is a civil and not a moral law (J. D. Michaelis), was the current one in the period of 18th-century rationalism. The distinction of a permanent and a transitory element in the law of the Sabbath is found, not only in Luther and Melanchthon, but in Calvin and other theologians of the Reformed church. The main controversy which arose on the basis of this distinction was whether the prescription of one day in seven is of permanent obligation. It was admitted that such obligation must be not natural but positive; but it was argued by the Calvinists that the proportion of time in which this obligation is agreeable to nature, based on the creation of six days, and in no way specially connected with anything Jewish. Hence it was regarded as a universal positive law of God. But those who maintained the opposite view were not excluded from the number of the orthodox. The latter conception found a place in the Socian school.

1 The last three sentences of this paragraph are taken almost bodily from Robertson Smith's later views (Old Testament in the Jewish Church, pp. 335 seq.).

DE CAMP, JOSEPH (1838—1904). American portrait and figure painter, was born in Cincinnati, Ohio, in 1838. He was a pupil of Frank Duveneck and of the Royal Academy of Munich; became a member of the society of Ten American Painters, and a teacher in the schools of the Pennsylvania Academy of Fine Arts, Philadelphia, and the Boston Museum of Fine Arts; and painted important mural decorations in the Philadelphia city hall.

DECAMPS, ALEXANDRE GABRIEL (1803-1860). French painter, was born in Paris on the 3rd of March 1803. In his youth he travelled in the East, and reproduced Oriental life and scenery with a bold fidelity to nature that made his works the puzzle of conventional critics. His powers, however, soon came to be recognized, and he was ranked along with Delacroix and Vernet as one of the leaders of the French school. At the Paris Exhibition of 1835 he received the grand or council medal. Most of his life was passed in the neighbourhood of Paris. He was passionately fond of animals, especially dogs, and indulged in all kinds of field sports. He died on the 22nd of August 1860 in consequence of being thrown from a vicious horse while hunting at Fontainebleau.

The style of Decamps was characteristically and intensely French. It was marked by vivid dramatic conception, by a manipulation bold and rapid, sometimes even to roughness, and especially by original and startling use of decided contrasts of colour and bright and shade. His subjects embraced an unusually wide range. He availed himself of his travels in the East in dealing with scenes from Scripture history, which he was probably the first of European painters to represent with their true and natural local background. Of this class were his "Joseph sold by his Brethren," "Moses taken from the Nile," and his scenes from the life of Samson, nine vigorous sketches in charcoal and white. Perhaps the most impressive of his historical pictures is his "Defeat of the Cambri," representing with wonderful skill the conflict between a horde of barbarians and a disciplined army. Decamps produced a number of genre pictures, chiefly of scenes from French and Algerine domestic life, the most marked feature of which is humour. The same characteristic attaches to most of his numerous animal paintings. He painted dogs, horses, &c., with great fidelity and sympathy; but his favourite subject was monkeys, which he depicted in various studies and sketches with a grotesque humour that could scarcely be surpassed. Probably the best known of all his works is "The Monkey Connoisseurs," a clever satire of the jury of the French Academy of Painting, which had rejected several of his earlier works on account of their divergence from any known standard. The pictures and sketches of Decamps were first made familiar to the English public through the lithographs of Eugène le Roux.

See Moreau's Decamps et son œuvre (Paris, 1890).

DECAPOLIS, a league of ten cities (Δήκα πόλεις) with their surrounding district, situated with one exception on the eastern side of the upper Jordan and the Sea of Tiberias. Being essentially a confederation of cities it is impossible precisely to fix Decapolis as a region with definite boundaries. The names of the original ten cities are given by Fliny; these are as follows: Damascus, Philadelphia, Raphana, Scythopolis (= Beth-Shan, now Beisan); west of Jordan; Gadara, Hippus, Dios, Pella, Gerasa, and Kanatha. Of these Damascus alone retains its importance. Scythopolis (as represented by the village of Beisan) is still inhabited; the ruins of Pella, Gerasa and Kanatha survive, but the other sites are unknown or disputed. Scythopolis, being in command of the communications with the sea and the Greek cities on the coast, was the most important member of the league. The league subsequently received additions and some of the original ten dropped out. In Ptolemy's enumeration Raphana has no place, and nine, such as Kapitolias, Edrei, Bosra, &c., are added. The purpose of the league was no doubt mutual defence against the marauding Bedouin tribes that surrounded them. These were hardly if at all checked by the Semitic kinglys to whom the Romans delegated the government of eastern Palestine.

It was probably soon after Pompey's campaign in 64-63 B.C. that the Decapolis league took shape. The cities comprising it
were united by the main roads on which they lay, their respective spheres of influence touching, if not overlapping, one another. A constant communication was maintained with the Mediterranean ports and with Greece, and there was a vigorous municipal life which found expression in literature, in athletic contests, and in a thriving commerce, thus carrying a truly Hellenic influence into Perea and Galilee. From Josephus we learn that the cities were severely subject to the governor of Syria and taxed for imperial purposes; some of them afterwards came under Herod's jurisdiction, but reserved the substantial rights granted them by Pompey.

The best account is in G. A. Smith's "Historical Geography of the Holy Land," chap. xxviii.

DECASTY (Gr. δεστύ, ten, and στόνος, column), the architectural term given to a column where the front portico has ten columns; as in the temple of Apollo Didymeus at Miletus, and the portico of University College, London. (See Temple.)

DECATUR, STEPHEN (1779-1820), American naval commander, was born at Simplicieu, Maryland, on the 5th of January 1779, and entered the United States navy as a midshipman in 1798. He was promoted lieutenant a year later, and in that rank saw some service in the short war with France. In 1803 he was in command of the "Enterprise," which formed part of Commodore Preble's squadron in the Mediterranean, and in February 1804 led a daring expedition into the harbour of Tripoli for the purpose of burning the U.S. frigate "Philadelphia," which had fallen into Tripolitan hands. He succeeded in his purpose and made his escape under the fire of the batteries with a loss of only one man wounded. This brilliant exploit earned him his captain's commission and a sword of honour from Congress. Decatur was subsequently engaged in all the attacks on Tripoli between 1804 and 1805. In the War of 1812 his ship the "United States" captured H.M.S. "Macedonian," after a desperate fight, and in 1813 he was appointed commodore to command a squadron of the Mediterranean fleet. He blocked the British in a. In an attempt to break out in February 1815, Decatur's flagship the "President" was cut off and after a spirited fight forced to surrender to a superior force. Subsequently he commanded in the Mediterranean against the corsairs of Algiers, Tunis and Tripoli with great success. On his return he was made a navy commissioner (November 1815), an office which he held until his death, which took place in a duel with Commodore James Barron at Bladensburg, Md., on the 22nd of March 1820.

See Mackenzie, Life of Decatur (Boston, 1846).

DECAZES, a city and the county-seat of Macon county, Illinois, U.S.A., in the central part of the state, near the Sangamon river, about 39 m. E. of Springfield. Pop. (1890) 16,841; (1900) 20,754, of whom 1939 were foreign-born; (1910 census) 31,140. Decatur is served by the Cincinnati, Hamilton & Dayton, the Illinois Central, the Wabash (which maintains cars there), and the Vandia railways, and is connected with Danville, Saint Louis, Springfield, Peoria, Bloomington and Champaign by the Illinois Traction System (electric). Decatur has three large parks and a public library; and S.E. of Fairview Park, with a campus of 35 acres, is the James Millikin University (co-educational; Cumberland Presbyterian), founded in 1901 by James Millikin, and opened in 1903. The university comprises schools of liberal arts, engineering (mechanical, electrical, and civil), domestic economy, fine and applied arts, commerce and finance, library science, pedagogy, music, and a preparatory school; in 1907-1898 it had 936 students, 440 being in the school of music. Among the city's manufactures are iron, brass castings, agricultural implements, flour, Indian corn products, soda furnaces, plumbers' supplies, coffins and caskets, bar and store fixtures, gas and electric light fixtures, street cars, and car trucks. The value of the city's factory products increased from 85,703,677 in 1895, 88,667,302 in 1905, to 68,8% in 1910. The city is also an important shipping point for agricultural products (especially grain), and for coal taken from the two mines in the city and from mines in the surrounding country. The first settlement in Decatur was made in 1826, and the place was incorporated in 1836. On the 22nd of February 1836 a convention of Illinois editors met at Decatur to determine upon a policy of opposition to the Kansas-Nebraska Bill. They called a state convention, which met at Bloomington, and which is considered to have taken the first step toward founding the Republican party in Illinois.

DECAZES, ÉLBIE, DUC (1758-1866), French statesman, was born at Saint Martin de Laye in the Gironde. He studied law, became a judge in the tribunal of the Seine in 1806, was attached to the cabinet of Louis Bonaparte in 1807, and was counsel to the court of appeal at Paris in 1811. Immediately upon the fall of the empire he declared himself a Royalist, and remained faithful to the Bourbons through the Hundred Days. He made the personal acquaintance of Louis XVIII during that period through Baron Louis, and the king rewarded his energy and tact by appointing him prefect of police at Paris on the 7th of July 1815. His marked success in that difficult position won for him the ministry of police, in succession to Fouche, on the 24th of September. In the interval he had been elected deputy for the Seine (August 1815) and both as deputy and as minister he led the moderate Royalists. His formula was "to royalize France and to nationalize the monarchy." The Moderates were in a minority in the chamber of 1815, but Decazes persuaded Louis XVIII. to dissolve the house, and the elections of October 1816 gave them a majority. During the next four years Decazes was called upon to play the leading rôle in the government. At first, as minister of police he had to suppress the insurrections provoked by the ultra-Royalists (the White Terror); then, after the resignation of the duc de Richelieu, he took the actual direction of the ministry, although the nominal president was General J. J. P. A. Dessolle (1767-1828). He held at the same time the portfolio of the interior. The cabinet, in which Baron Louis was minister of finance, and Marshal Gouvion Saint-Cyr remained minister of war, was entirely Liberal; and its first act was to suppress the ministry of police, as Decazes held that it was incompatible with the principle of individual liberty. The ministry of the Chamber of Peers, where the Ultra-Royalists were in a majority, and to overcome it he got the king to create sixty new Liberal peers. He then passed the laws on the press, suppressing the censorship. By reorganization of the finances, the protection of industry and the carrying out of great public works, France regained its economic prosperity, and the ministry became popular. But the powers of the Grand Alliance had been watching the growth of Liberalism in France with increasing anxiety. Metternich especially ascribed this mainly to the 'weakness' of the ministry, and when in 1819 the political elections still further illustrated this trend, notably by the election of the celebrated Abbé Grégoire, it began to be debated whether the time had not come to put in force the terms of the secret treaty of Aix-la-Chapelle. It was this threat of foreign intervention, rather than the clamour of the "Ultras," that forced Louis XVIII. to urge a change in the electoral law that should render such a "sousdud" as Grégoire's election impossible for the future. Dessolle and Louis, refusing to embark on this policy, now resigned; and Decazes became head of the new ministry, as president of the council (November 1819). But the exclusion of Grégoire from the chamber and the changes in the franchise embittered the Radicals without conciliating the "Ultras." The news of the revolution in Spain in January 1820 added fuel to their fury; it was the foolish and criminal policy of the royal favourite that had once more unchained the demon of revolution. Decazes was denounced as the new Sejanus, the modern Catiline; and when, on the 13th of February, the duke of Berry was murdered, clamorous tongues loudly accused him of being an accomplice in the crime. Decazes, indeed, foreseeing the storm, at once placed his resignation in the king's hands. Louis at first refused. "They will attack," he exclaimed, "not your system, my dear son, but mine." But in the end he was forced to yield to the importunity of his son-in-law (February 17th); and Decazes, raised to the rank of duke, passed into honourable exile as ambassador to Great Britain.

This ended Decazes's meteoric career of greatness. In December 1821 he returned to sit in the House of Peers, when
DECAZEVILLE—DECEMBER

Le continued to maintain his Liberal opinions. After 1830 he adhered to the monarchy of July, but after 1848 he remained in retirement. He had organized in 1826 a society to develop the coal and iron of the Aveyron, and the name of Decazeville was given in 1829 to the principal centre of the industry. He died on the 24th of October 1860.

His son, Louis Charles Élie Decazes, duc de Glèbckberg (1819-1886), was born at Paris, and entered the diplomatic career. He became minister plenipotentiary at Madrid and at Lisbon, but the revolution of 1848 caused him to withdraw into private life, from which he did not emerge until in 1871 he was elected deputy to the National Assembly by the Gironde. There he sat in the right centre among the Orleanists, and was chosen by the duc de Broglie as minister of foreign affairs in November 1873. He voted with the Orleanists the "Constitutional Laws" of 1875, and approved of McMahon's parliamentary coup d'état on the 16th of May 1877. He was re-elected deputy in October 1877 by the arrondissement of Puget-Théniers, but his election was annulled by the chamber, and he was not re-elected. He died on the 16th of September 1886.

On the Duc Decazes see E. Daudet, Louis XVIII. et le duc Decazes (1890), and his "L'ambassade du duc Decazes" in the Revue des deux mondes for 1899.

DECAZEVILLE, a town of south-central France, in the department of Aveyron, 34 m. N.W. of Rodez by the Orleans railway. Pop. (1906) 9749. It possesses iron mines and is the centre of the coal-fields of the Aveyron, which supply the ironworks established by the Duc Decazes, minister of Louis XVIII.

A statue commemorates the founder.

DECCAN (Sans. Dakshina, "the South"), a name applied, according to Hindu geographers, to the whole of the territories in India situated to the south of the river Nerbudda. In its more modern acceptation, however, it is sometimes understood as comprising only the country lying between that river and the Kistna, the latter having for a long period formed the southern boundary of the Mahommedan empire of Delhi. Assigning it the more extended of these limits, it comprehends the whole of the Indian peninsula, and, in this view, the mountainous country, consisting of the Eastern and Western Ghats, constitutes the most striking feature of the Deccan. These two mountain ranges unite at their northern extremities with the Vindhyas, a chain of mountains, and thus formed a vast triangle supporting at a considerable elevation the expanse of table-land which stretches from Cape Comorin to the valley of the Nerbudda. The surface of this table-land slopes from west to east, as indicated by the direction of the drainage of the country—the great rivers, the Cauvery, Godavari, Kistna and Pennar, though deriving their sources from the base of the Western Ghats, all finding their way into the Bay of Bengal through fissures in the Eastern Ghats.

History.—The detailed and authentic history of the Deccan only begins with the 13th century A.D. Of the early history the main facts established are the Aryan invasion (c. 700 B.C.), the growth of the Maurya empire (320 B.C.) and the invasion (A.D. 1000) of the Scythic tribes known as the Sakas, Pathalvas and Yavanas, which led to the establishment of the power of the Kaharharata satraps in western India. In addition to this, modern study of monuments and inscriptions has recovered the names, and to a certain extent the records, of a succession of dynasties ruling in the Deccan; of these the most conspicuous are the Cholas, the Andhras or Satavahanas, the Chalukyas, the Rashtrakutas and the Yadavas of Devagiri (Deogiri). (See INDIA: History; BOMBAY PRESIDENCY: History; Inscriptions: Indian.) In 1294 Ala-ud-Din Khilji, emperor of Delhi, invaded the Deccan, stormed Devagiri, and reduced the Yadava rajas of Maharashtra to the position of tributary princes (see DAULATABAD), then proceeding southward overran Telingana and Carnata (1294-1300). With this event the continuous history of the Deccan begins. In 1397, owing to non-payment of tribute, a fresh series of Mussulman incursions began, under Malik Kafur, issuing in the final ruin of the Yadava power; and in 1389 the reduction of the Deccan was completed by Mahommad ben Tughlak. The imperial sway was, however, of brief duration. Telingana and Carnata speedily reverted to their former masters; and this defection on the part of the Hindu states was followed by a general revolt of the Mussulman governors, resulting in the establishment in 1347 of the independent Mahommedan dynasty of Bahmani, and the consequent withdrawal of the power of Delhi from the territory south of the Nerbudda. In the struggles which ensued, the Hindu kingdom of Telingana fell bit by bit to the Bahmani dynasty, who advanced their frontier to Golconda in 1373, to Warangal in 1421, and to the Bay of Bengal in 1472. On the dissolution of the Bahmani empire (1482), its dominions were distributed into the five Mahommedan states of Golconda, Bijapur, Ahmednagar, Bidar and Barar. To the south of these the great Hindu state of Carnata or Vijayanagar fell to the Portuguese, became the portuguese, became the Portuguese, became a practically independent sovereign. A few years later the emperor's viceroy in Ahmednagar, the nizam-al-mulk, threw off his allegiance and established the seat of an independent government at Hyderabad (1724). The remainder of the imperial possessions in the peninsula were held by chieftains acknowledging the supremacy of one or other of these two potentates. In the sequel, Mysore became the prize of the Mahommedan usurper Hyder Ali. During the contests for power which ensued about the middle of the 18th century between the native chiefs, the French and the English took opposite sides. After a brief course of triumph, the interests of France declined, and a new empire in India was established by the British. Mysore formed one of their earliest conquests in the Carnatic; Trivandrum and the Malabar coast were shortly after annexed to their dominions. In 1790 the forfeited possessions of the Peshwa added to their extent; and these acquisitions, with others which have more recently fallen to the paramount power by cession, conquest or failure of heirs, form a continuous territory stretching from the Nerbudda to Cape Comorin. Its length is upwards of 1000 m., and its extreme breadth exceeds 800. This vast tract comprehends the chief provinces now distributed between the presidencies of Madras and Bombay, together with the native states of Hyderabad and Mysore, and those of Kolhapur, Sawantwadi, Travancore, Cochin and the petty possessions of France and Portugal.

DECELEA (Gr. Δεκελεία), an Attic deme, on the pass which led over the east end of Mt. Parnes towards Oropus and Chalcis. From its position it had a commanding view over the Athenian plain. Its eponymous hero, Decelius, was said to have indicated to Theseus the way to the land of the Mantineans, and by leaving the place where Theseus had hidden his shield at Aphaia; and hence the town was a traditional friendship between the Decelians and the Spartans (Herodotus i. 73). This tradition, together with the advice of Alcibiades, led the Spartans to fortify Decleia as a basis for permanent occupation in Attica during the later years of the Peloponnesian War, from 423-424 B.C. Its position enabled them to harass the Athenians constantly, and to form a centre for fugitive slaves and other deserters. The royal palace of Tatoi has been built on the site.

See PELOPONNESIAN WAR; also Judicia in Pauly-Wissowa, Realencyclopiade.

DECEMBER (Lat. decem, ten), the last month of the year. In the Roman calendar, traditionally ascribed to Romulus, the year was divided into ten months; the last of which, called December, or the tenth month, and this name, though etymologically...
incorrect, was retained for the last or twelfth month of the year as now divided. In the Romanian calendar December had thirty days; Numa reduced the number to twenty-nine; Julius Caesar added two days to this, giving the month its present length. The *Saturnalia* occurred in December, which is therefore styled "acceptus genii" by Ovid (Fasti, iii. 58) and this also explains the phrase of Horace "libertate Decembri utere" (Sat. ii. 7). Martial applies to the month the epithet *cornus* (hoary), and Ovid styles it *gelidus* (frosty) and *fumosus* (smoky). In the reign of Commodus it was temporarily styled *Aazonius*, in honour of the emperor's mistress, whom he had had painted as an Amazon. The Saxons called it *winter-monath*, winter month, and *heligh-monath*, holy month, from the fact that Christmas fell within it. Thus the modern Germans call it *Christmonat*. The 22nd of December is the date of the winter solstice, when the sun reaches the tropic of Capricorn.

**DECEMVIRI** ("the ten men"), the name applied by the Romans to any official commission of ten. The title was often followed by a statement of the purpose for which the commission was appointed, e.g. *Xiviri legibus scribundis, sitibus judicandis, sancris faciundis*.  

I. Apart from such qualification, it signified chiefly the temporary commission which superseded all the ordinary magistrates of the Republic from 451 to 440 B.C., for the purpose of drawing up a code of laws. In 462 B.C. a tribune proposed that the appointment of a commission to draw up a code expressing the legal principles of the administration was necessary to secure for the *plebs* a hold over magisterial caprice. Continued agitation to this effect resulted in an agreement in 452 B.C. between patricians and plebeians that decemvirs should be appointed to draw up a code, that during their tenure of office all other magistracies should be in abeyance, that they should not be subject to appeal, but that they should be bound to maintain the laws which guaranteed by religious sanctions the rights of the *plebs*. The first board of decemvirs (apparently consisting wholly of patricians) was appointed to hold office during 451 B.C.; and the chief man among them was Appius Claudius. Livy (iii. 32) says that only patricians were eligible. Mommsen, however, held that plebeians were legally eligible, though none were actually appointed for 451. The decemvirs ruled with singular moderation, and submitted to the *Comitia Centuraria* a code of laws in ten headings, which was passed. So popular were the decemvirs that another board of ten was appointed for the following year, some of whom, if the extant list of names is correct, were certainly plebeians. These added two more to the ten laws of their predecessors, thus completing the Laws of the Twelve Tables (see Roman Law). But their rule then became violent and tyrannical, and they fell before the fury of the *plebs*, though for some reason, not easily understood, they continued to have the support of the patricians. They were forced to abdicate (440 B.C.), and the ordinary magistrates were restored.  

II. The judicial board of decemvirs (*sitiibus judicandis*) formed a civil court of ancient origin concerned mainly with questions bearing on the status of individuals. They were originally a body of jurists which gave a verdict under the presidency of the praetor (*q.v.*), but eventually became annual minor magistrates of the Republic, elected by the *Comitia Tributa*.  

III. The priestly board of decemvirs (*sancris faciundis*) was an outcome of the claim of the *plebs* to a share in the administration of the state religion. Five of the decemvirs were patricians, and five plebeians. They were first appointed in 367 B.C. instead of the *duumviri* who had hitherto performed these duties. The board was increased to fifteen in the last century of the Republic. Its chief function was the care of the *Sibylline books*, and the celebration of the games of Apollo (Livy x. 8) and the Secular Games (Tac. Ann. xi. 11).  

IV. Decemvirs were also appointed from time to time to control the distribution of the public land (*agris dandis adisgnandis*; see Agrarian Laws).  

**DECHEN, ERNST HEINRICH KARL** von (1800—1888), German geologist, was born in Berlin on the 25th of March 1800, and was educated in the university in that city. He subsequently studied mining in Bochum and Essen, and was in 1820 placed in the mining department of the Prussian state, serving on the staff until 1864, and becoming director in 1841 when he was stationed at Bonn. In early years he made journeys to study the mining systems of other countries, and with this object he visited England and Scotland in company with Karl von Oeynhausen (1797—1865). In the course of his work he paid special attention to the coal-formations of Westphalia and northern Europe generally, and he greatly furthered the progress made in mining and metallurgical works in Rhenish Prussia. He made numerous contributions to geological literature; notably the following:—  

Geogenostische Ümrissse der Rheinländer zwischen Basel und Main mit besonderer Rücksicht auf das Vorkommen des Steinsalzes (with von Oeynhausen and La Roche), 2 vols. (Berlin, 1855);  

Geogenostische Führer in das Siebenheerge am Rhein (1858);  

Die natürlichen Mineralien und Gebirgsarten im deutschen Reich (1873). But his main work was a geological map of Rhenish Prussia and Westphalia in 35 sheets on the scale of 1: 80,000, issued with two volumes of explanatory text (1855—1882). He published also a small geological map of Germany (1860). He died at Bonn on the 15th of February 1889.  

(H. W. B.)  

**DECIDUOUS** (from Lat. *decidere*, to fall down), a botanical and zoological term for "falling in season," as of petals after flowering, leaves in autumn, the teeth or horns of animals, or the wings of insects.  

**Decimal Coinage.** Any currency in which the various denominations of coin are arranged in multiples or submultiples of ten (*latin* *decem*), with reference to a standard unit, is a decimal system. Thus if the standard unit be 1 the higher coins will be 10, 100, 1000, &c., the lower 1, 01, 001, &c. In a perfect system there would be no breaks or interpolations, but the actual currencies described as "decimal" do not show this rigid symmetry. In France the standard unit—the franc—has the 10 franc and the 100 franc pieces above it; the 10 centime below it; there are also, however, 50 franc, 20 franc, 5 franc, 2 franc pieces as well as 50 and 20 centime ones. Similar irregularities occur in the German and United States coinages, and indeed in all countries in which a decimal system has been established. Popular convenience has compelled this departure from the strict decimal form.  

Subject to these practical modifications the leading countries of the world (Great Britain and India are the chief exceptions) have adopted decimal coinage. The United States led the way (1786 and 1792) with the dollar as the unit, and France soon followed (1799 and 1803), her system being extended to the countries of the Latin Union (1862). The German empire (1873), the Scandinavian States (1875), Austria-Hungary (1876), developed in 1892 and Russia (1893 and 1897) are further adherents to the decimal system. The Latin-American countries and Japan (1871) have also adopted.  

In England proposals for decimalizing the coinage have long been under discussion at intervals. Besides the inconvenience of altering the established currency, the difficulty of choosing between the different schemes proposed has been a considerable obstacle. One plan took the farthing as a base: then 10 farthings = 1 doct (21s.), 10 docts = 1 florin (2s. 1d.), 10 florins = 1 pound (20s. 1d.). The advantages claimed for this scheme were (1) the preservation of the smaller coins (the penny = 4 farthings); and (2) the avoidance of interference with the smaller retail prices. Its great disadvantage was the destruction of the existing unit of value—the pound—and the consequent disturbance of all accounts. A second proposal would retain the pound as unit and the florin, but would subdivide the latter into

---

DECIUS—DECLARATION

913

100 “units” (or farthings reduced 4%) and introduce a new coin = 10 units (2.4d.). By it the unit of account would remain as at present, and the shilling (50 units) would continue in use. The alteration of the bronze and several silver coins, and the need of readjusting all values and prices expressed in pence, formed the principal difficulties. A third scheme, which was connected with the assimilation of English to French and American money, proposed the establishment of an 8s. gold coin as unit, with the tenpenny or franc and the penny (reduced by 4%) as subdivisions. The new coin would be equivalent to 10 francs (or by an anticipated reduction of the dollar) 2 dollars. None of these plans has gained any great amount of popular support.

For the general question of monetary scales see MONEY, and for the decimal system in reference to weights and measures see FRANK SWIFT, WEIGHTS AND MEASURES (1875).

DECIUS, GAIUS MESSIUS QUINTUS TRAJANUS (201-251), Roman emperor, the first of the long succession of distinguished men from the Illyrian provinces, was born at Budalia near Sirium in lower Pannonia in A.D. 201. About 245 the emperor Philip the Arab entrusted him with an important command on the Danube, and in 249 (or end of 248), having been sent to put down a revolt of the troops in Moesia and Pannonia, he was forced to assume the imperial dignity. He still protested his loyalty to Philip, but the latter advanced against him and was slain near Verona. During his brief reign Decius was engaged in important operations against the Goths, who crossed the Danube and overran the districts of Moesia and Thrace. The details are obscure, and there is considerable doubt as to the part taken in the campaign by Decius and his son (of the same name) respectively. The Goths were surprised by the emperor while besieging Nicopolis on the Danube; at his approach they crossed the Balkans, and attacked Philippopolis. Decius followed them, but a severe defeat near Beroë made it impossible to save Philippopolis. He was driven into the territory of the Goths who treated the conquered with frightful cruelty. Its commander, Priscus, declared himself emperor under Gothic protection. The siege of Philippopolis had so exhausted the numbers and resources of the Goths, that they offered to surrender their booty and prisoners on condition of being allowed to retire unmolested. But Decius, who had succeeded in surrounding them and hoped to cut off their retreat, refused to entertain their proposals. The final engagement, in which the Goths fought with the courage of despair, took place on swampy ground in the Dobrudja near Abritum (Abrittus) or Forum Trebonii and ended in the defeat and death of Decius and his son. Decius was an excellent soldier, a man of amiable disposition, and a capable administrator, worthy of being classed with the best Romans of the ancient type. The chief blot on his reign was the systematic and authorized persecution of the Christians, which had for its object the restoration of the religion and institutions of ancient Rome. Either as a concession to the senate, or perhaps with the idea of improving public morality, Decius endeavoured to revise the separate offices and authority of the censor. The choice was left to the senate, who unanimously selected Valerian (afterwards emperor). But Valerian, well aware of the dangers and difficulties attaching to the office at such a time, declined the responsibility. The invasion of the Goths and the death of Decius put an end to the abortive attempt.

See Aurelius Victor, De Caesaribus, 29, Epit. 29; Jordanes, De rebus Geticis, 18; fragments of Dextipus, in C. W. Müller, Frag. Hist. Graec. iii. (1849); Gibbon, Decline and Fall, chap. 10; H. Schiller, Geschichte der römischen Kaiserzeit, i. (pt. 2) 1875.

DEIZE, a town of central France, in the department of Nièvre, on an island in the Loire, 24 m. S.E. of Nevers by the Paris- Lyon railway. Pop. (1906) 3813. The most important of its buildings is the church of Saint Aré, which dates in part from the 11th and 12th centuries; there are also ruins of a castle of the counts of Nevers. The town has a statue of Guy Coquille, the lawyer and historian, who was born there in 1523. Deize is situated at the starting-point of the Nivernais canal. The coal mine of La Machine, which belongs to the Schneider Company of Le Creusot, lies four miles to the north. The industries of Deize and its suburbs on both banks of the Loire include the working of gypsum and lime, and the manufacture of ceramic products and glass. Trade is in horses from the Morvan, cattle, coal, iron, wood and stone.

Under the name of Decetia the place is mentioned by Julius Caesar as a stronghold of the Aedui, and in 52 B.C. was the scene of a meeting of the senate held by him to settle the leadership of the tribe and to reply to his demand for aid against Vercingetorix. In later times it belonged to the counts of Nevers, from whom it obtained a charter of franchise in 1226.

DECKER, SIR MATTHEW, Bart. (1670-1749), English merchant and writer on trade, was born in Amsterdam in 1679. He came to London in 1702 and established himself there as a merchant. He was remarkably successful in his business life, gaining great wealth and having many honours conferred upon him. He was a director of the East India Company, sat in parliament for four years as member for Bishops Castle, and was high sheriff of Surrey in 1729. He was created a baronet by George I. in 1716. Decker's fame as a writer on trade rests on two tracts. The first, Serious considerations on the several high duties which the Nation in general, as well as Trade in particular, labours under, with a proposal for preventing the removal of goods, discharged the trader from any search, and raising all the Publick Supplies by one single tax (1745; name prefixed to 7th edition, 1756), proposed to do away with customs duties and substitute a tax upon houses. He also suggested taking the duty off tea and putting instead a licence duty on households wishing to consume it. The second, an Essay on the Causes of the Decline of the Foreign Trade, consequently of the value of the lands in Britain, and on the means to restore both (1744), has been attributed to W. Richardson, but internal evidence is strongly in favour of Decker's authorship. He advocates the licence plan in an extended form; urges the repeal of import duties and the abolition of bounties, and, in general, shows himself such a strong supporter of the doctrine of free trade as to rank as one of the most important forerunners of Adam Smith. Decker died on the 18th of March 1749.

DECKER, PIERRE DE (1812-1891), Belgian statesman and author, was educated at a Jesuit school, studied law at Paris, and became a journalist on the staff of the Revue de Bruxelles. In 1839 he was elected to the Belgian lower chamber, where he gained a great reputation for oratory. In 1855 he became minister of the interior and minister of finance, and, attempted, by a combination of the moderate elements of the Liberal parties, the impossible task of effecting a settlement of the educational and other questions by which Belgium was distracted. In 1866 he retired from politics and went into business, with disastrous results. He became involved in financial speculations which lost him his good name as well as the greater part of his fortune; and, though he was never proved to have been more than the victim of clever operators, when in 1871 he was appointed by the Catholic cabinet governor of Limburg, the outcry was so great that he resigned the appointment and retired definitively into private life. He died on the 4th of January 1891. Decker, who was a member of the Belgian academy, wrote several historical and other works of value, of which the most notable are Études historiques et critiques sur les monnaies-de-piéce en Belgique (Brussels, 1844); De l'influence du libre arbitre de l'homme sur les faits sociaux (1848); L'Esprit de la cour (2 vols. Paris, 1852); Étude politique sur le vicomte Ch. Vilain XIII (1879); Épisodes de l'histoire de l'art en Belgique (1883); Biographie de H. Conscience (1895).

DECLARATION (from Lat. declarare, to make fully clear, clarius), formerly, in an action at English law, the first step in pleading—the precise statement of the matter in respect of which the plaintiff sued. It was divided into counts, in each of which a specific cause of action was alleged, in wide and general terms, and the same acts or omissions might be stated in several counts as different causes of actions. Under the system of pleading established by the Judicature Act 1873, the declaration has been superseded by a statement of claim setting forth the facts on which the plaintiff relies. Declarations are now in use only in the mayor's court of London and certain local courts of record,
and in those of the United States and the British colonies in which the Common Law system of pleading survives. In the United States a declaration is termed a "complaint," which is the first pleading in an action. It is divided into parts,—the title of the court and name; the venue or county in which the facts are alleged to have occurred; the commencement, which contains a statement of the names of the parties and the character in which they appear; the statement of the cause of action; and the conclusion or claim for relief. (See Pleading.)

The term is also used in other English legal connexions; e.g., the Declaration of Insolvency which, when filed in the Bankruptcy Court by any person unable to pay his debts, amounts to an act of bankruptcy (see Bankruptcy); the Declaration of Title, for which, when a person apprehends an invasion of his title to land, he may, by the Declaration of Title Act 1862, petition the Court of Chancery (see Land Registration); or the Declaration of Trust, whereby a person acknowledges that property, the title of which he holds, belongs to another, for whose use he holds it; by the Statute of Frauds, declarations of trust of land must be evidenced in writing and signed by the party declaring the trust. (See Trusts.) By the Statutory Declarations Act 1859 (which was an act to make provision for the abolition of the practice of oaths, and to repeal a previous act of the same session on the same subject), declarations were specified in which a solemn declaration was, or might be, substituted for an affidavit. In nearly all civilized countries an affidavit is now permitted to those who object to take an oath or upon whose conscience an oath is not binding. (See Affidavit; Oath.)

An exceptional position in law is accorded to a Dying or Deathbed Declaration. As a general rule, hearsay evidence is excluded on a criminal charge, but where the charge is one of homicide it is the practice to admit dying declarations of the deceased with respect to the cause of his death. But before such declarations can be admitted in evidence against a prisoner, it must be proved that the deceased when making the declaration had given up all hope of recovery. Unsworn declarations as to family matters, e.g., as to pedigree, may also be admitted as evidence, as well as declarations made by deceased persons in the course of their duty. (See Evidence.)

DECLARATION OF PARIS, a statement of principles of international law adopted at the conclusion (16th of April 1856) of the preliminary negotiations for the treaty of Paris at the suggestion of Count Walewski, the French plenipotentiary. The declaration set out that maritime law in time of war had long been the subject of deplorable disputes, that the uncertainty of the rights and duties in respect of it gave rise to differences of opinion between neutrals and belligerents which might occasion serious difficulties and even conflicts, and that it was consequently desirable to agree upon some fixed uniform rules. The plenipotentiaries therefore adopted the following four principles:—

1. Privateering is and remains abolished; 2. The neutral flag covers enemy’s goods, with the exception of contraband of war; 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy’s flag; 4. Blockades, in order to be binding, must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.

They also undertook to bring to the attention of the contracting parties the fact that they had not taken part in the congress of Paris and to invite them to accede to it. The text of the declaration concluded as follows:—"Convinced that the maxims which they now proclaim cannot but be received with gratitude by the whole world, the undersigned plenipotentiaries doubt not that the efforts of their governments to obtain the general adoption thereof will be crowned with full success."

The declaration is of course binding only on the powers which adopted it or have acceded to it. The majority which adopted it consisted of Great Britain, Austria, France, Prussia, Russia, Sardinia and Turkey. The United States government declined to sign the declaration on the ground that, not possessing a great navy, they would be obliged in time of war to rely largely upon merchant ships commissioned as war vessels, and that therefore the abolition of privateering would be entirely in favour of European powers, whose large navies rendered them practically independent of such aid. All other maritime states acceded to the declaration except Spain, Mexico and Venezuela.

Although the United States and Spain were not parties to the declaration, both, during the Spanish-American War, observed its principles. The Spanish government, however, expressly gave notice that it reserved its right to issue letters of marque. At the same time both belligerents organized services of auxiliary cruisers composed of merchant ships under the command of naval officers. In how far this might operate as a veiled revival of the forbidden practice has now ceased to be a matter of much importance, the Hague Conference having adopted a series of rules on the subject which may be said to interpret the first of the four principles of the declaration with such precision as to take its place.

The New Convention on the subject (October 18th, 1907) sets out that, in view of the incorporation in time of war of merchant vessels in combatant fleets, it is desirable to define the conditions under which this can be effected, that, nevertheless, the contracting powers, not having been able to come to an understanding on the question whether the transformation of a merchant ship into a war vessel may take place on the high seas, are agreed that the question of the condition under which the transformation is to take place is to be determined by the rules adopted, which are as follows:

Art. i. No merchant ship transformed into a war vessel can have the rights and obligations attaching to this condition unless it is placed under the direct authority, the immediate control and the responsibility of the power whose flag it carries.

Art. ii. Merchant ships transformed into war vessels must bear the distinctive external signs of war vessels of their nationality.

Art. iii. The officer commanding must be in the service of the state, and properly commissioned by the competent authorities. His name must appear in the list of officers of the combatant fleet.

Art. iv. The crew must be subject to the rules of military discipline.

Art. v. Every merchant ship transformed into a war vessel is bound to conform, in its operation, to the laws and customs of war.

Art. vi. The belligerent who transforms a merchant ship into a war vessel must, as soon as possible, mention this transformation on the list of vessels belonging to its combatant fleet.

Art. vii. The provisions of the present convention are only applicable among the contracting powers and provided the belligerents are all parties to the convention.

See T. Gibson Bowles, Declaration of Paris (London, 1900); Sir T. Barclay, Problems of International Practice and Diplomacy (London, 1897), chap. xvi. (T. B.)

DECLATOR, in Scots law, a form of action by which some right of property, or of servitude, or of status, or some inferior right or interest, is sought to be judicially declared.

DECLINATION (from Lat. declinare, to decline), in magnetism, the angle between the meridian and the magnetic north, i.e., the variation between the true meridian and the magnetic meridian. In 1596 at London the angle of declination was 11° E. of N., in 1652 magnetic north was true north, in 1815 the magnetic needle pointed 24° 45' W. of N., in 1891 18° W., in 1896 17° 56' W. and in 1907 16° 45'. The angle is gradually diminishing and the declination will in time again be north, when it will slowly increase in an easterly direction, the north magnetic pole oscillating slowly around the North Pole. Regular daily changes of declination also occur. Magnetic storms cause irregular variations sometimes of one or two degrees. (See Magnetism, Terrestrial.)

In astronomy the declination is the angular distance, as seen from the earth, of a heavenly body from the celestial equator, thus corresponding with terrestrial latitude.

DECOLOURIZING, in practical chemistry and chemical technology, the removal of coloured impurities from a substance. The agent most frequently used is charcoal, preferably prepared from blood, which when shaken with a coloured solution frequently precipitates the colouration, the reason for which is not always clear. Thus the red colour of wines may be removed by filtering the wine through charcoal; the removal of the dark-coloured

1 At the 7th plenary sitting of the second Hague Conference (September 7th, 1907) the chiefs of the Spanish and Mexican delegations, M. de Villa Urrutia and M. de la Barra, announced the determination of their respective governments to accede to the Declaration of Paris.

2 This relates to the incident in the Russo-Japanese War of the transformation of Russian vessels which had passed through the Dardanelles unarmed.
imparities which arise in the manufacture of sugar may be similarly effected. Other "decolorizers" are sulphurous acid, permanganates and manganates, all of which have received application in the sugar industry.

DECORATED PERIOD, in architecture, the term given by Richman to the second pointed or Gothic style, 1307–1377. It is characterized by its window tracery, geometrical at first and flowing in the later period, owing to the omission of the circles in the tracery of windows, which led to the juxtaposition of the foliations and their pronounced curves of contrefleure. This flowing or flamboyant tracery was introduced in the first quarter of the century and lasted about fifty years. The arches are generally equilateral, and the mouldings bolder than in the Early English, with less depth in the hollows and with the silt largely used. The ball flower and a four-leaved flower take the place of the dog-tooth, and the foliage in the capitals is less conventional than in Early English and more flowing, and the diaper patterns in walls are more varied. The principal examples are those of the east end of Lincoln and Carlisle cathedrals; the west fronts of York and Lichfield; the crossing of Ely cathedral, including the lantern and three west bays of choir and the Lady Chapel; and Melrose (R. P. S.).

DE COSTA, BENJAMIN FRANKLIN (1831–1904), American clergyman and historical writer, was born in Charlestown, Massachusetts, on the 10th of July 1831. He graduated in 1856 at the Biblical Institute at Concord, New Hampshire (now a part of Boston University), became a minister in the Episcopal Church in 1857, and during the next three years was a rector first at North Adams, and then at Newton Lower Falls, Mass. After serving as chaplain in two Massachusetts regiments during the first two years of the Civil War, he became editor (1863) of The Christian Times in New York, and subsequently edited The Episcopalian and The Magazine of American History. He was rector of the church of St John the Evangelist in New York city from 1881 to 1899, when he resigned in consequence of being converted to Roman Catholicism. He was one of the organizers and long the secretary of the Church Temperance Society, and founded and was the first president (1884–1890) of the American branch of the White Cross Society. He became a Roman Catholic, and on early American cartography and the history of the period of exploration. He died in New York city on the 4th of November 1904. In addition to numerous monographs and valuable contributions to Winsor's Narrative and Critical History of America, he published The Pre-Columbian Discovery of America by the Northmen (1868); The Northmen in Maine (1870); The Moabite Stone (1871); The Rector of Roxburgh (1871), a novel under the nom de plume of "William Hickling"; and Verazano the Explorer; being a Vindication of his Letter and Voyage (1880).

DE COSTER, CHARLES THÉODORA HENRI (1827–1879), Belgian writer, was born at Munich on the 20th of August 1827. His father, Augustin de Coster, was a native of Liège, who was attached to the household of the papal nuncio at Munich, but soon returned to Belgium. Charles was placed in a Brussels bank, but in 1850 he entered the university of Brussels, where he completed his studies in 1855. He was one of the founders of the Société des Jeunes Écrivains, a small literary club, more than one member of which was to achieve literary distinction. De Coster made his début as a poet in the Revue trimestrielle, founded in 1854, and his first efforts in prose were contributed to a periodical entitled Uylenspiegel (founded 1856). A correspondence covering the years 1850–1858, his Lettres à Élsa, were edited by Ch. Potvin in 1894. He was a keen student of Rabelais and Montaigne, and familiarized himself with 16th-century French. He said that Flemish manners and speech could not be rendered faithfully in modern French, and accordingly wrote his best works in the old tongue. The success of his Légendes flamandes (1857) was increased by the illustrations of Félicien Rops and other friends. In 1861 he published his Contes brahansons, in modern French. His masterpiece is his Légende de Thyl Uylenspiegel et de Lamme Goedazk (1867), a 16th-century romance, in which Belgian patriotism found its fullest expression. In the preparation for this prose epic of the gaunx he spent some ten years. Uylenspiegel (Eulenspiegel) has been compared to Don Quixote, and even to Fagin. He is the type of the 16th-century Flemish, and the history of his resurrection from the grave itself was accepted as an allegory of the destiny of the race. The exploits of himself and his friend form the thread of a semi-historical narrative, full of racy humour, in spite of the barbarities that find a place in it. This book also was illustrated by Rops and others. In 1870 De Coster became professor of general history and of French literature at the military school. His works however were not financially profitable; in spite of his government employment he was always in difficulties; and he died in much discouragement on the 7th of May 1879 at Ixelles, Brussels. The expensive form in which Uylenspiegel was produced made it open only to a limited class of readers, and when a new and cheap edition in modern French appeared in 1893 it was received practically as a new book in France and Belgium.

DECOY, a contrivance for the capture or enticing of duck and other wild fowl within range of a gun, hence any trap or enticement into a place or situation of danger. Decoys are usually made on the following plan: long tunnels leading from the sea, channel or estuary into a pool or pond are covered with an arched roof, which gradually narrows in width; the ducks are enticed into this by a tame trained bird, also known as a "decoy" or "decoy-duck." In America the "decoy" is an artificial bird, placed in the water as if it were feeding, which attracts the wild fowl within range of the concealed sportsman. The word "decoy" has, etymologically, a complicated history. It appears in English first in the 17th century in these senses as "coy" and "coy-duck," from the Dutch kooi, a word which is ultimately connected with Latin caseo, hollow place, "cage." The de, with which the word begins, is either a corruption of "duck-coy," the Dutch article de, or a corruption of the Dutch eende-kooi, eende, duck. The New English Dictionary points out that the word "decoy" is found in the particular sense of a sharper or swindler as a slang term slightly earlier than "coy" or "decoy" in the ordinary sense, and, as the name of a game of cards, as early as 1550, apparently with no connection in meaning. It is suggested that "coy" may have been adapted to this word.

DEGREE (from the past participle, decretus, of Lat. docere), in earlier form Decret, an authoritative decision having the force of law; the judgment of a court of justice. In Roman law, a degree (decretum) was the decision of the emperor, as the supreme judicial officer, settling a case which had been referred to him. In ecclesiastical law the term was given to a decision of an ecclesiastical council settling a doubtful point of doctrine or discipline (cf. also Decretals). In English law decree was more particularly the judgment of a court of equity, but since the Judicature Acts the expression "judgment" (q.v.) is employed in reference to the decisions of all the divisions of the supreme court. A "degree nisi" is the conditional order for a dissolution of marriage made by the divorce court, and it is made "absolute" after six months (which period may, however, be shortened in the absence of sufficient cause shown to the contrary. (See Divorce.) Decret arbiter is a Scottish name for the lord of an arbitrator.

DECRETALS (Epistolae decretales), the name (see Decree above), which is given in Canon Law to those letters of the pope which formulate decisions in ecclesiastical law; they are generally given in answer to consultations, but are sometimes due to the initiative of the popes. These furnish, with the canons of the councils, the chief source of the legislation of the church, and form the greater part of the Corpus Juris. In this connexion they are dealt with in the article on Canon Law (q.v.).

The False Decretals. A special interest, however, attaches to the celebrated collection known by this name. This collection, indeed, comprises at least as many canons of councils as decreals, and the decreals contained in it are not all forgeries. It is an amplification and interpolation, by means of spurious decreals, of the canonical collection in use in the Church of Spain in the 8th century, all the documents in which are perfectly authentic.

1 Distinguish "coy," affectedly shy or modest, from O. Fr. coy, Lat. quietus, quiet.
DECRETALS, FALSE

With these amplifications, the collection dates from the middle of the 6th century. We shall give a brief account of its contents, its history and its influence on canon law.

The author assumes the name of Isidore, evidently the archbishop of Seville, whom he was credited with a preponderating part in the compilation of the Hispana; he takes in addition the surname of Mercator, perhaps because he has made use of two passages of Marius Mercator. Hence the custom of alluding to the author of the collection under the name of the pseudo-Isidore.

The collection itself is divided into three parts. The first, which is entirely spurious, contains, after the preface and various introductory sections, seventy letters attributed to the popes of the first three centuries, up to the council of Nicea, i.e. up to but not including St. Silvester; all these letters are a fabrication of the pseudo-Isidore, except two spurious letters of Clement, which were already known. The second part is the collection of councils, classified according to their regions, as it figures in the Hispana; the few spurious pieces which are added, and notably the famous Donation of Constantine, were already in existence. In the third part the author continues the series of decretales which he had interrupted at the council of Nicaea. But as the collection of authentic decretales does not begin till Siricius (385), the pseudo-Isidore first forges thirty letters, which he attributes to the popes from Silvester to Damasus; after this he includes the authentic decretales, with the intermixture of thirty-five apocryphal ones, generally given under the name of those popes who were not represented in the authentic collection, but sometimes also under the names of the others, for example, Damasus, St. Leo, Vigilius and St. Gregory; with one or two exceptions he does not interpolate genuine decretales. The series stops at St. Gregory the Great (d. 604), except for one letter of Gregory II. (715-731). The forged letters are not, for the most part, entirely composed of fresh material; the author draws his inspiration from the notices on each of the popes given in the Liber Pontificalis; he inserts whole passages from ecclesiastical writers; and he anstates the evidences of a discipline which actually existed; so it is by no means all invented. The authentic elements were calculated to serve as a passport for the forgeries, which were, moreover, quite skilfully composed.

In fact, the collection thus blended was passed from hand to hand without meeting with any opposition. At most all that was asked was whether those decretales which did not appear in the Liber canonum (the collection of Dionysius Exiguus, accepted in France) had the force of law, but Pope Nicholas having answered that all the pontifical letters had the same authority (see Decr. Gra. Dist. xix. c. 1), they were henceforward accepted, and passed in turn into the later canonical collections.

No doubts found an expression until the 11th century, when Cardinal Nicholas of Cusa (d. 1464) and Juan Torquemada (d. 1468) freely expressed their suspicions. More than one scholar of the 16th century, George Cassander, Erasmus, and the two editors of the Decretum Gratiani, Dumoulin (d. 1568) and Le Conte (d. 1577), decisively rejected the False Decretals. This contention was again upheld, in the form of a violent polemic against the papacy, by the Centuriones of Magdeburg (Ecclesiæ historia, Basel, 1559-1574); the attempt at refutation by the Jesuit Torres (Adversus Centur., Magdeburg, libri quinque, Florence, 1572) provoked a violent rejoinder from the Protestant minister David Blondel (Pseudo-Isidorens et Turri Innocentina, Geneva, 1620). Since then, the conclusion has been accepted, and all researches have been of an almost exclusively historical character. One by one the details are being precisely determined, and the question may now almost be said to be settled.

In the first place, an exact determination of the date of the collection has been arrived at. On the one hand, it cannot go back further than 847, the date of the False Capitularies, with which the author of the False Decretals was acquainted. On the other hand, in a letter of Lupus, abbott of Ferrières, written in 858, and in the synodical letter of the council of Quiery in 857, are to be found quotations which are certainly from these false decretales; and further, an undoubted allusion in the statutes given by Hincmar to his diocese on the 1st of November 852. The composition of the collection must then be dated approximately at 850.

The object which the forger had in view is clearly stated in his preface; the reform of the canon law, or rather its better application. But, again, in what particular respects he wishes it to be reformed can be best deduced from certain preponderant ideas which make themselves felt in the apocryphal documents. He constantly harps upon accusations brought against bishops and the way they were judged; his wish is to prevent them from being unjustly accused, deposed or deprived of their sees; to this end he multiplies the safeguards of procedure, and secures the right of appeal to the pope and the possibility of restoring bishops to their sees. His object, too, was to protect the property, as well as the persons, of the clergy against the encroachments of the temporal power.

In the second place, Isidore wishes to increase the strength and cohesion of the church; he tries to give it a greater ability to the diocese and the ecclesiastical province; he reinforces the rights of the bishop and his comprovincials, while he initiates a determined campaign against the choreiscopi; finally, as the keystone of the arch he places the papacy. These aims are most laudable, and in no way subversive; but the author must have had some particular reasons for emphasizing these questions rather than others; and the examination of these reasons may help us to determine the nationality of this collection.

The name of Isidore usurped by the author at first led to the supposition that the False Decretals originated in Spain; this opinion no longer meets with any support; it is enough to point out that there is no Spanish manuscript of the collection, at least until the 13th century. In the 16th century the Protestants, who wished to represent the forgeries in the light of an attempt in favour of the papacy, ascribed the origin of the False Decretals to Rome, but neither the manuscript tradition nor the facts confirm this view, which is nowadays entirely abandoned. Everybody is agreed in placing the origin of the False Decretals within the Frankish empire. Within these limits, three different theories have successively arisen: ‘At first it was thought that Isidore’s domicile could be fixed in the province of Mainz, it is now about fifty years ago that the balance of opinion was turned in favour of the province of Reims; and now, after the lapse of about twenty years, several authors have suggested the province of Tours’ (P. Fourrier, Étude sur les Pauisses Décrtales). In favour of Mainz, especial stress was laid on the fact that it was the country of Benedictus Levita, the compiler of the False Capitularies, to which the False Decretals are closely related. But Benedict, the deacon of Otgar of Mainz, is as much of a hypothetical personage as Isidore Mercator; moreover, in the middle of the 9th century the condition of the province of Mainz was not disturbed, nor were the choreiscopi menaced. In favour of Reims, it has been pointed out that it was there that the first judicial use of the False Decretals was recorded, in the trials of Rothard, bishop of Soissons (d. 869), and of Hincmar the younger, bishop of Laon (d. c. 882); and an application of the axiom has been attempted: Is fisci cui prodest. But both these trials took place later than 852, at which date the existence of the collection is an established fact; the texts of it were used, but they were in existence before. Between 847 and 852, the province of Reims was disturbed by another affair, that of the clergy ordained by Ebbo at the time of his short restoration to the see of Reims, in 840-841; these clerics, Vulfadus (afterwards archbishop of Bourges), and a few others, had been suspended by Hincmar on his election in 845. But the affair of Ebbo’s clergy did not become critical till the council of Soissons in 853; up till then these clergy had, so far 41 The False Capitularies are for civil legislation what the False Decretals are for ecclesiastical legislation: three books of Capitularies of the Frankish kings, more of which are spurious than authen- tic. The author gives himself out as a certain Benedict, a deacon of the church of Mainz; hence the name by which he is usually known, Benedictus Levita. The two false collections are closely akin, and are doubtless the fabrication of the same hands. 41
as we know, produced no documents, and the citations from the False Decretals made in their later writings do not prove that they had forged them. Moreover, Hinmar would not have cited the forged letters of the popes in 852; above all, this theory would not explain the chief preoccupation of the forger, which is to protect bishops against unjust judgments and depositions. We must, then, look for conditions in which the bishops were con- 
cerned of the age which has suggested the province of Tours. Brittany, which was dependent on the province of Tours, had just for a time recovered its independence, thanks to its duke Nominöö. The struggle between the two nationalities, the 
Celt and the Frank, found a reflexion in the sphere of religion. The Breton bishops were for the most part abbots of monasteries, who had but little consideration for the territorial limits of the 
civitates; and many of the religious usages of the Bretons differed profoundly from those of the Franks. Charlemagne had divided 
up the Breton dioceses and established in them Frankish bishops. 
Nominöö hastened to depose the four Frankish bishops, after 
wrangling from them by force confessions of simony; he then 
established a metropolitan see at Dol. Hence arose incessant 
complaints on the part of the dispossessed bishops, of the 
metropolitan of Tours, and his suffragans, notably those of Angers 
and Le Mans, which were more exposed than the others to the 
incursions of the Bretons; and this gave rise to numerous papal 
letters, and all this throughout a period of thirty years. There 
were requests that the bishops should be judged according to 
the rules, protests against their depopulation, demands for the 
restoration of the bishops to their sees. These circumstances 
fall in perfectly with the questions about which, as we have pointed 
out, the pseudo-Isidore was mainly concerned: the judgment of 
bishops, and the stability of the ecclesiastical 

Canonic Influence.

In the province of Tours, attempts have been made to 
order to enforce the rights of the papacy, we may at 
least consider whether the popes did not make use of the 
False Decretals to support their rights. It is 
certain that in 864 Rothal of Soissons took with him 
to Rome, if not the collection, at least important extracts 
from the pseudo-Isidore; M. Fournier has pointed out in the 
letters of the pope of that time, "a literary influence, which 
is shown in the choice of expressions and metaphors," notab- 
ably in those passages relating to the restitutio spoli; but he 
concludes by affirming that the ideas and acts of Nicholas 
were not modified by the new collection: even before 864 he 
acted in affairs concerning bishops, e.g. in the case of the 
Breton bishops or the adversaries of Photius, patriarch of 
Constantinople, exactly as he acted later; all that can be 
said is that the False Decretals, though not expressly cited 
by the pope, "led him to accentuate still further the arguments 
which he drew from the decrees of his predecessors," notably 
with regard to the exceptio spoli. In the papal letters of the 
end of the 9th and the whole of the 10th century, only two 
or three insignificant citations of the pseudo-Isidore have 
been pointed out; the use of the pseudo-Isidorian forged documents 
did not become prevalent at Rome till about the middle of 
the 11th century, in consequence of the circulation of the canonical 
collections in which they figured; but nobody then thought 
of casting any doubts on the authenticity of those documents. 
One thing only is established, and this may be said to have been 
the real effect of the False Decretals, namely, the powerful 
impulse which they gave in the Frankish territories to the move- 
ment towards centralization round the see of Rome, and the legal 
obstacles which they opposed to unjust proceedings against 
the bishops.

Bibliography.—The best edition is that of F. Hinschius, 
Decretales pseudo-Isidorianae et capitula Anglariam (Leipzig, 1861). 
In the authentic texts are printed in two columns, the forgeries 
across the whole width of the page; an important preface of ccxxvii. pages contains, besides the classification of the MSS., a 
profuse introduction and a copious critical appendix. A special 
collection. After the works cited above, the following dissertations 
should be noted. Placing the origin of the False Decretals at Rome: 
is: A. Theiner, De pseudo-Isidorianae canonum collectione (Breslau, 1855); at Mainz, M. A. L. de Brucker, De decretalibus duodecim 
canonum et collectione canonum III. (S. Leonis opera, t. iii.; Migne, Patro- 
logia Lat. t. 56); Blasius, De coll. canonum Isidori Mercatoris 
(Naples, 1760); Wasserlehen, Beiträge zur Geschichte der falschen 
Decretalen (Breslau, 1844); in the province of Reims: W. 
Leicht, "Pseudoisidorianische entscheidung des Sybel 
(1860); Hinschius, Preface, p. cxxvii.; A. Tardieu, Histoire des sources du droit canoni (Paris, 1887); Schneider, Die Lehren der Kirchen-
rechtspolitik (Regensburg, 1892). An excellent résumé of the 
question seems more favourable to Le Mans in the article of the 
Kirchenlexicon of Wetzer and Welte (2nd ed.); F. Lot, Études sur 
de régime de Hugues Capet (Paris, 1903); Lesne, La Hierarchy épiscopale 
de Gaule et Germanie (Paris, 1896); for the province of Tours and 
Le Mans: Inde Mem. Die Entstehung der pseudodot, Filschhen 
in Le Mans (Leipzig, 1886. It is he who pointed out the con- 
xexion with the forgeries of Le Mans); especially Paul Fournier, 
La Question des fausses décretales," in the Nouvelle Revue histo-
rique des sciences et des lettres (1889); Deflor, Die durch 
des sauvant cath. t. ii.; "Étude sur les fausses décretales," in 
Revue d'histoire ecclésiastique de Lepin (1906, 1907), to which the 
above article is greatly indebted. 

(At O.)

DECURIO, a Roman official title, used in three connexions. 
A member of the senatorial order in the Italian towns under 
the administration of Rome, and later in provincial towns 
organized on the Italian model (see CURIA 4). The number of 
decuriones varied in different towns, but was usually 100. The 
qualifications for the office were fixed in each town by a special 
for that community (lex municipalis). Cicero (in Verr. 2. 49, 120) 
alludes to an age limit (originally thirty years, until lowered 
by Augustus to twenty-five), to a property qualification (Ep. i. 19, 2), 
and to certain conditions of rank. The method of 
appointment varied in different towns and at different periods. 
In the early municipal constitution ex-magistrates passed 
automatically into the senate of their town; but at a later date this 
order was reversed, and membership of the senate became 
a qualification for the magistrate. Cicero (i.e.) speaks of the senate 
in the Sicilian towns as appointed by a vote of the township. 
But in most towns it was appointed by the chief magistrate to 
draw up a list (album) of the senators every five years. The 
decuriones held office for life. They were convened by the 
mayor, who presided as in the Roman senate. Their powers 
were extensive. In all matters the magistrates were obliged 
to act according to their direction, and in some towns they heard 
cases of appeal against judicial sentences passed by the 
mayor. By the time of the municipal law of Julius Caesar 
(45 B.C.) special privileges were conferred on the decuriones, 
including the right to appeal to Rome for trial in criminal cases. 
Under the principate their status underwent a marked decline 
but were no longer coveted, and documents of the 3rd and 
4th centuries show that means were devised to compel members 
of the towns to undertake it. By the time of the jurists it had 
become hereditary and compulsory. This change was largely 
due to the heavy financial burdens which the Roman govern- 
ment laid on the municipal senates. (2) A president of the 
decurie, a subdivision of the curia (q.v.). (3) An officer in 
the Roman cavalry, commanding a troop of ten men (decuria).

DÉDÉAGATCH, a seaport of European Turkey, in the vilayet of 
Adrianople, 10 m. N.W. of the Maritza estuary, on the Gulf of 
Enos, an inlet of the Aegean Sea. Pop. (1905) about 3000,
DEDHAM—DEDICATION

mostly Greeks. Until 1871 Dedeagatch was a mere cluster of fishermen’s huts. A new town then began to spring up, settlers being attracted by the prospect of opening up a trade in the products of a vast forest of valonia oaks which grew near. In 1873 it was made the chief town of a Kaza, to which it gave its name, and a Kaimakam was appointed to it. In 1884 it was raised in administrative rank from a Kaza to a Sanjak, and the governor became a Muezzaraf. In 1889 the Greek archbishopric of Enos was transferred to Dedeagatch. On the opening, early in 1896, of the Constantinople-Salonica railway, which has a station here, a large proportion of the extensive transit trade which Enos, situated at the mouth of the Maritsa, had acquired, was immediately diverted to Dedeagatch, and an era of unprecedented prosperity began; but when the railway connecting Burgas on the Black Sea with the interior was opened, in 1898, Dedeagatch lost all it had won from Enos. Owing to the lack of shelter in its open roadstead, the port has not become the great commercial centre which its position otherwise qualifies it to be. It is, however, one of the chief outlets for the grain trade of the Adrianople, Demotica and Xanthi districts. The valonia trade has also steadily developed, and is supplemented by the export of timber, tobacco and almonds. In 1871, while digging out the foundations of their houses, the settlers found many ancient tombs. Probably these are relics, not of the necropolis of the ancient Zonē, but of a monastic community of Dervishes, of the Dédé sect, which was established here in the 15th century, shortly after the Turkish conquest, and gave to the place its name.

DEDHAM, a township and the county seat of Norfolk county, Massachusetts, U.S.A., with an area of 23 sq. m. of comparatively level country. Pop. (1890) 7123; (1900) 7457, of whom 2180 were foreign-born; (1910 U.S. census) 984. The township is traversed by the New York, New Haven & Hartford railway, and by interurban electric lines. It contains three villages, Dedham, East Dedham and Oakdale. Dedham has a public library (1854; incorporated 1871). The Dedham historical society was organized in 1859 and was incorporated in 1862. The Fairbanks house was erected in part as early as 1654. Carpets, handkerchiefs and woollen goods are manufactured, and a pottery here is reputed to make the only true crackleware outside the East. Dedham was “planted” in 1635 and was incorporated in 1636. It was one of the first two inland settlements of the colony, being coeval with Concord. The original plantation, about 20 m. long and 10 m. wide, extended from Roxbury and Dorchester to the present state line of Rhode Island; from this territory several towns were created, including Westwood (pop. in 1910, 1266), in 1807. A free public school, one of the first in America to be supported by direct taxation, was established in Dedham in 1645. In the Woodward tavern, the birthplace of Fisher Ames, a convention met in September 1774 and adjourned to Milton (Mass.), where it passed the Suffolk Resolution. DEDICATION (Lat. dedicatio, from dedicare, to proclaim, to announce), properly the setting apart of anything by solemn proclamation. It is thus in Latin the term particularly applied to the consecration of altars, temples and other sacred buildings, and also to the inscription prefixed to a book, &c., and addressed to some particular person. This latter practice, which formerly had the purpose of gaining the patronage and support of the person so addressed, is now only a mark of affection or regard. In law, the word is used of the setting apart by a private owner of a road to public use. (See HIGHWAY.)

The Feast of Dedication (יוֹם דֶּדֶּכֶת; τα ἐγκαίνια) was a Jewish festival observed for eight days from the 25th of Kislev (i.e. about December 12) in commemoration of the consecration (165 B.C.) of the temple and especially of the altar of burnt offering, after they had been desecrated in the persecution under Antiochus Epiphanes (168 B.C.). The distinguishing features of the festival were the illumination of houses and synagogues, a custom probably taken over from the feast of tabernacles, and the recitation of Psalm xxx. The biblical references are 1 Macc. i. 41-64; iv. 36-39; 2 Macc. vi. 1-11; John x. 22. See also 2 Macc. i. 9, 18; ii. 16; and Josephus, Antiq. xii. 4. J. Wellhausen suggests that the feast was originally connected with the winter solstice, and only afterwards with the events narrated in Maccabees.

Dedication of Churches.—The custom of solemnly dedicating or consecrating buildings as churches or chapels set apart for Christian worship must be almost as old as Christianity itself. If we find no reference to it in the New Testament or in the very earliest apostolic or post-apostolic writings, it is merely due to the fact that Christian churches had not as yet begun to be built. Throughout the ante-Nicene period, until the reign of Constantine, Christian churches were few in number, and any public dedication of them would have been attended with danger in those days of heathen persecution. This is why we are ignorant as to what liturgical forms and what consecration ritual were employed in those primitive times. But when we come to the earlier part of the 4th century allusions to and descriptions of the consecration of churches become plentiful.

Like so much else in the worship and ritual of the Christian church this service is probably of Jewish origin. The hallowing of the tabernacle and of its furniture and ornaments (Exodus xl.); the dedication of Solomon’s temple (1 Kings viii.) and of the second temple by Zerubbabel (Ezra vi.), and its rededication by Judas Maccabaeus (see above), and the dedication of the temple of Herod the Great (Josephus, Antiq. of the Jews, bk. xv. c. xi. § 6), and our Lord’s recognition of the Feast of Dedication (St John xi. 22, 23)—all these point to the probability of the Christians deriving their custom from a Jewish origin, quite apart from the intrinsic appropriateness of such a custom in itself.

Eusebius (Hist. Eccles. lib. x. cap. 3) speaks of the dedication of churches rebuilt after the Diocletian persecution, including the church at Tyre in A.D. 314. The consecration of the church of the Holy Sepulchre at Jerusalem in A.D. 335, which had been built by Constantine, and of other churches after his time, are described both by Eusebius and by other ecclesiastical historians. From them we gather that every consecration was accompanied by a celebration of the Holy Eucharist and a sermon, and special prayers of a dedicatory character, but there is no trace of the elaborate ritual, to be described presently, of the medieval pontificals dating from the 8th century onwards.

The separate consecration of altars is provided for by canon 14 of the council of Agde in 596, and by canon 26 of the council of EPAONE in 517, the latter containing the first known reference to the usage of anointing the altar with chrism. The use of both holy water and of anunction is attributed to St Columbanus, who died in 615 (Walafrid Strabo, Vita S. Galli, cap. 6).

There was an annual commemoration of the original dedication of the church, a feast with its octave extending over eight days, during which Gregory the Great encouraged the erection of booths and general feasting on the part of the populace, to compensate them for, and in some way to take the place of, abolished heathen festivities (Sozomen, Hist. Eccles. lib. ii. cap. 26; Bede, Hist. Eccles. lib. i. cap. 39).

At an early date the right to consecrate churches was reserved to bishops, as by canon 37 of the first council of Braga in 563, and by the 23rd of the Irish collections of canons, once attributed to St Patrick, but hardly to be put earlier than the 8th century (Haddon and Stubbs, Councils, &c., vol. ii. pt. 2, p. 329).

When we come to examine the MS. and printed service-books of the medieval church, we find a lengthy and elaborate service provided for the consecration of churches. It is contained in the pontifical. The earliest pontifical which has come down to us is that of Egerbt, archbishop of York (732-766), which, however, only survives in a 10th-century MS. copy. Later pontificals are numerous; we cannot describe all their variations. A good idea, however, of the general character of the service will be obtained from a skeleton of it as performed in this country before the Reformation according to the use of Sarum. The service in question is taken from an early 15th-century pontifical in the Cambridge University Library as printed by W. Makell in Monumenta ritualia ecclesiae Anglicanae, &c., ed., vol. i. pp. 195-239.
There is a preliminary office for laying a foundation-stone. On the day of consecration the bishop is to vest in a tent outside the church, thence to proceed to the door of the church on the outside, a single deacon being inside the church, and there to bless holy water, twelve lighted candles being placed outside, and twelve inside the church. He is then to sprinkle the walls all round outside, and to knock at the door; then to sprinkle the walls all round outside a second time and to knock at the door again; then to sprinkle the walls all round outside a third time, and a third time to knock at the door, by which he will then enter, all laity being excluded. The bishop is then to fix a cross in the centre of the church, after which the litany is said, including a special clause for the consecration of the church and altar. Next the bishop inscribes the alphabet in Greek letters on one of the limbs of St Andrew's cross from the left east corner to the right west corner on the pavement cindered for the purpose, and the alphabet in Latin on the other limb from the right east corner to the left west corner. Then he is to genuflect before the altar or cross. Then he blesses water, mingled with salt, ashes and wine, and sprinkles therewith all the walls of the church inside thrice, beginning at the altar; then he sprinkles the centre of the church longwise and crosswise on the pavement, and then goes round the outside of the church sprinkling it thrice. Next re-entering the church and taking up a central position he sprinkles holy water to the four points of the compass, and toward the roof. Next he anoints with chrism the twelve internal and twelve external wall-crosses, afterwards parambulating the church thrice inside and outside, censing it.

Then there follows the consecration of the altar. First, holy water is blessed and mixed with chrism, and with the mixture the bishop makes a cross in the middle of the altar, then on the right and the left, then on the four horns of the altar. Then the altar is sprinkled seven times or three times with water not mixed with chrism, and the altar-table is washed therewith and censed and wiped with a linen cloth. The centre of the altar is next anointed with the oil of the catechumens in the form of a cross; and the altar-stone is next anointed with chrism; and then the whole altar is rubbed over with oil of the catechumens and with chrism. Incense is next blessed, and the altar censed, five grains of incense being placed crosswise in the centre and at the four corners, and upon the grains five slender candle crosses, which are to be lit. Afterwards the altar is scraped and cleansed; then the altar-crosses and ornaments having been sprinkled with holy water are placed upon the altar, which is then to be censed.

All this is subsidiary to the celebration of mass, with which the consecration is concluded. The transcription and description of the various collects, psalms, anthems, benedictions, &c., which make up the order of dedication have been omitted for the sake of brevity.

The Sarum order of dedication described above is substantially identical with the Roman order, but it would be superfluous to tabulate and describe the lesser variations of language or ritual. There is, however, one very important and significant piece of ritual, not found in the above-described English church order, but always found in the Roman service, and not infrequently found in the earlier and later English uses, in connexion with the presence and use of relics at the consecration of an altar. According to the Roman ritual, after the priest has sprinkled the walls of the church inside thrice all round and then sprinkled the pavement from the altar to the porch, and sideways from wall to wall, and then to the four quarters of the compass, he prepares some cement at the altar. He then goes to the place where the relics are kept, and starts a solemn procession with the relics round the outside of the church. There a sermon is preached, and two decrees of the council of Trent are read, and the founder's deed of gift or endowment. Then the bishop, anointing the door with chrism, enters the church with the relics and deposits them in the cavity or consecration in the altar. Having been enclosed they are censed and covered in, and the cover is anointed. Then follows the censing and wiping of the altar as in the Sarum order.

This use of relics is very ancient and can be traced back to the time of St Ambrose. There was also a custom, now obsolete, of enclosing a portion of the consecrated Eucharist if relics were not obtainable. This was ordered by cap. 2 of the council of Celciby (Chelsea) in 816. But though ancient the custom of enclosing relics was not universal, and where found in English church orders, as it frequently is found from the pontifical of Egbert onwards, it is called the "Mos Romanus" as distinguished from the "Mos Anglicanus" (Archaeologia, iv. 416). It is absent from the description of the early Irish form of consecration preserved in the Leabhar Breac, translated and annotated by Rev. T. Olden in the Transactions of the St Paul's Ecclesiolog. Soc. vol. iv. pt. ii. p. 98.

The curious ritual act, technically known as the abecedarium, i.e. the tracing of the alphabet, sometimes in Latin characters, sometimes in Latin and Greek, sometimes, according to Menard, in Latin, Greek and Hebrew, along the limbs of St Andrew's cross on the floor of the church, can be traced back to the 8th century and may be earlier. Its origin and meaning are unknown. Of all explanations we like best the recent one suggested by Rossi and adopted by the bishop of Salisbury. This interprets the St Andrew's cross as the initial Greek letter of Christus, and the whole act as significant of taking possession of the site to be consecrated in the name of Christ, who is the Alpha and Omega, the first and last, the beginning and the end, the one who is, who was, and who is to come, the Alpha and Omega, the all-sufficient, the first and the last, the eternal Lamb.

The disentangling the Gallican from the Roman elements in the early Western forms of service is a delicate and difficult task, undertaken by Monsignore Louis Duchesne, who shows how the former partook of a funerary and the latter of a baptismal character (Christian Worship (London, 1904), cap. xii.).

The dedication service of the Greek Church is likewise long and elaborate. Relics are to be prepared and guarded on the day previous in some neighbouring sacred building. On the morning following, all ornaments and requisites having been got ready, the laity being excluded, the bishop and clergy vested proceed to fix in its place and consecrate the altar, a long prayer of dedication being said, followed by a litany. The altar is then sprinkled with warm water, then with wine, then anointed with chrism in the form of a cross. The altar, the book of the gospels, and all cloths are then censed, every pillar is crossed with chrism, while various cloths are said and psalms recited. One lamp is then filled with oil and lit, and placed on the altar, while clergy bring offerings of incense and other elements of the service, and all who have come to the service take part in the ceremony, and after the prayer for the faithful, the bishop and clergy go to the building where the relics have been kept and guarded. A procession is formed and advances thence with the relics, which are borne by a priest in a holy vessel (discus) on his head; the church having been entered, the relics are placed by him with much ceremonial in the "confession," the recess prepared in or about the altar for their reception, which is then anointed and sealed up. After this the liturgy is celebrated both on the feast of dedication and on seven days afterwards.

There is no authorized form for the dedication of a church in the reformed Church of England. A form was drawn up and approved by both houses of the convocation of Canterbury under Archbishop Tenison in 1723, and an almost identical form was submitted to convocation in 1755, but its consideration was not completed by the Lower House, and neither form ever received royal sanction. The consequence has been that Anglican bishops have fallen back on their undefined jux liturgicum, and have drawn up and promulgated forms for use in their various dioceses, some of them being content to borrow from other dioceses for this purpose. There is a general similarity, with a certain amount of difference in detail, in these various forms. In the diocese of London the bishop, attended by clergy and churchwardens, receives at the west door, outside, a petition for consecration; the procession then moves round the whole church outside, while certain psalms are chanted. On again reaching the west door the bishop knocks thrice for admission, and the door being opened the procession advances to the east end of the church.
DEE, JOHN (1527–1608), English mathematician and astrologer, was born on the 13th of July 1527, in London, where his father was, according to Wood, a wealthy vintner. In 1542 he was sent to St John's College, Cambridge. After five years spent in mathematical and astronomical studies, he went to Holland, in order to visit several eminent continental mathematicians. Having remained abroad nearly a year, he returned to Cambridge, and was elected a fellow of Trinity College, then first erected by King Henry VIII. In 1548 he took the degree of master of arts; but in the same year he found it necessary to leave England on account of the suspicions entertained of his being a conjurer; these were first excited by a piece of machinery, which, in the Paradoxes of Aristophanes, he exhibited to the university, representing the scarabaeus flying up to Jupiter, with a man and a basket of virtuals on its back. He went first to the university of Louvain, where he resided about two years, and then to the college of Rheims, where he had extraordinary success in his public lectures on Euclid's Elements. On his return to England in 1551 King Edward assigned him a pension of 100 crowns, which he afterwards exchanged for the rectorcy of Upton-upon-Severn, Worcestershire. Soon after the accession of Mary he was accused of using enchantments against the queen's life; but, after a tedious confinement, he obtained his liberty in 1555, by an order of council.

When Elizabeth ascended the throne, Dee was asked by Lord Dudley to name a propitious day for the coronation. On this occasion he was introduced to the queen, who took lessons in the mystical interpretation of his writings, and made him great promises, which, however, were never fulfilled. In 1564 he again visited the continent, in order to present his Monas hieroglyphica to the emperor Maximilian, to whom he had dedicated it. He returned to England in the same year; but in 1571 he was in Lorraine, whither two physicians were sent by the queen to relieve him in a dangerous illness. Returning to his home at Mortlake, in Surrey, he continued his studies, and made a collection of curious books and manuscripts, and a variety of instruments. In 1578 Dee was sent abroad to consult with German physicians and astrologers in regard to the illness of the queen. On his return to England, he was employed in investigating the title of the crown to the countries recently discovered by British subjects, and in furnishing geographical descriptions. Two large rolls containing the desired information, which he presented to the queen, are still preserved in the Cottonian Library. A learned treatise on the reformation of the calendar, written by him about the same time, is also preserved in the Ashmolean Library at Oxford.

From this period the philosophical researches of Dee were concerned entirely with necromancy. In 1581 he became acquainted with Edward Kelly, an apothecary, who had been convicted of forgery and had lost both ears in the pillory at Lancaster. He professed to have discovered the philosopher's stone, and, by his assistance Dee performed various incantations, and maintained a frequent imaginary intercourse with spirits. Shortly afterwards Kelly and Dee were introduced by the earl of Pembroke to Queen Elizabeth in the palace of Siradis, devoted to the same pursuits, who persuaded them to accompany him to his native country. They embarked for Holland in September 1583, and arrived at Laski's residence in February following. Upon Dee's departure the mob, believing him a wizard, broke into his house, and destroyed a quantity of furniture and books and his chemical apparatus. Dee and Kelly lived for some years in Poland and Bohemia in alternate wealth and poverty, according to the credulity or scepticism of those before whom they exhibited. They professed to raise spirits by incantation; and Kelly dictated the utterances to Dee, who wrote them down and interpreted them.

Dee at length quarrelled with his companion, and returned to England in 1590. He was helped over his financial difficulties by the queen and her friends. In May of 1595 he became warden of Manchester College. In November 1604 he returned to Mortlake, where he died in December 1608, at the age of eighty-one, in the greatest poverty. Aubrey describes him as "of a very fair,

He there lays the keys on the table "which is to be hallowed." The Veni Creator is then sung kneeling, followed by the litany with special suffrages. The bishop then proceeds to various parts of the church and blesses the font, the chancel, with special references to confirmation and holy matrimony, the lectern, the pulpit, the clergy stalls, the choir seats, the holy table. The deed of consecration is then read and signed, and the celebration of Holy Communion follows with special collects, epistle and gospel.

The Church of Ireland and the episcopal Church of Scotland are likewise without any completely authorized form of dedication, and their archbishops or bishops have at various times issued forms of service on their own authority.

(2. 0.)

DEE. f

DEE. Conditionalibus, a chapter of the statute of Westminster the Second (1295) which originated the law of entail. Strictly speaking, a form of entail was known before the Norman feudal law had been domesticated in England. The common form was a grant "to the foefee and the heirs of his body," by which limitation it was sought to prevent alienation from the lineage of the first purchaser. These grants were also known as feuda conditionata, because if the donee had no heirs of his body the estate reverted to the donor. This right of reversion was evaded by the interpretation that such a gift was a conditional fee, which enabled the donee, if he had an heir of the body born alive, to alienate the land, and consequently disinherit the issue and defeat the right of the donor. To remedy this the statute De Donis Conditionalibus was passed, which enacted that, in grants to a man and the heirs of his body, the will of the donor according to the form in the deed of gift manifestly expressed, should be from thenceforth observed; so that they to whom the land was given under such condition, should have no power to alienate the land so given, but that it should remain unto the issue of those to whom it was given after their death, or unto the giver or his heirs, if issue fail. Since the passing of the statute an estate given to a man and the heirs of his body has been known as an estate tail, or an estate in fee tail (feudum taili) or (feudum taili) or (feudum taili), the word tail being derived from the French taille, to cut, the inheritance being by the statute cut down and confined to the heirs of the body. The operation of the statute soon produced innumerable evils: "children, it is said, grew disobedient when they knew they could not be set aside; farmers were deprived of their leases; creditors were defrauded of their debts; innumerable latent entails were produced to deprive purchasers of the land they had fairly bought; treasons also were encouraged, as estates tail were not liable to forfeiture longer than for the tenant's life " (Williams, Real Property). Accordingly, the power of alienation was reintroduced by the judges in Taltaran's case (Year Book, 12 Edward IV., 1472) by means of a fictitious suit or recovery which had originally been devised by the regular clergy for evading the statutes of mortmain. This was abolished by an act passed in 1833. (See Fine.)

DEDUCTION (from Lat. deducere, to take or lead from or out of, derive), a term used in common parlance for the process of taking for granted, or subtracting from, in mathematics, conclusions specifically for the argumentative process of arriving at a conclusion from evidence, i.e., for any kind of inference.

In this sense it includes both arguments from particular facts and those from general laws to particular cases. In logic it is generally used in contradiction to "induction" for a kind of mediate inference, in which a conclusion (often itself called the deduction) is regarded as following necessarily under certain fixed laws from premises. This, the most common, form of deduction is the syllogism (q.v.; see also Logic), which consists in taking a general principle and deriving from it facts which are necessarily involved in it. This use of deduction is of comparatively modern origin; it was originally used as the equivalent of Aristotle's ἀπαγόρητος (see Prior Analytics, B xxvii.). The modern use of deduction is practically identical with the Aristotelian syllogism.

1 Two forms of the verb are used, "deduce" and "deduct"; originally synonymous, they are now distinguished, "deduce" being confined to arguments, "deduct" to quantities.
clear sanguine complexion, with a long beard as white as milk—a very handsome man—tall and slender. He wore a gown like an artist's gown with hanging sleeves." Dee's Speculum or mirror, a piece of solid pink-tinted glass about the size of an orange, is preserved in the British Museum.

His principal works are—Propadendum apheristicum (London, 1558); Monas hieroglyphica (Antwerp, 1564); Epistulae ad Fredericam Cumminsum (Pescara, 1570); Epistolae mathematicae ad Anglicum Euclidum (1570); De diverso Annotationes et Inventiones added after Euclid's Elements (1570); Epistulae written in corong Ephemerasius Joanissi Feldii, a. 1557; Paradisae comminutiones praecoxque nucleus guidam (London, 1573). The catalogue of his printed and published works is to be found in his Compendium Reheasal, as well as in his letter to Archbishop Whitgift. A manuscript of Dee's, relating what passed for many years between him and some spirits, was edited by Meric Casaubon and published in 1659. The Private Diary of Dr John Dee, and the Catalogue of his Library of Manuscripts, edited by J. O. Halliwell, was published by the Camb. Soc. for the encouragement of Learning in 1843. Deeds is the life of Thomas Smith's Vite illustrum virorum (1707); English translation by W. A. Ayton, the Life of John Dee (1909).

DEE (Welsh, Dyfrdwy, Lat., and in Milton, Dova), a river of Wales and England. It rises in Bala Lake, Merionethshire, which is fed by a number of small streams. Leaving the lake near the town of Bala it flows north-easterly to Corwen, turns thence E. by S. past Llangollen to a point near Overton, and then bends nearly north to Chester, and thereafter north-west through a great estuary opening into the Irish Sea. In the Llangollen district the Dee crosses Denbighshire, and thence forms the boundary of that county with Shropshire, a detached part of Flint, and Cheshire. From Bala nearly down to Overton, a distance of 35 m., during which the river falls about 330 ft., its course lies through a narrow and beautiful valley, enclosed on the south by the steep lower slopes of the Berwyn Mountains and on the north by a succession of lesser ranges. The portion known as the Vale of Llangollen is especially famous. Here an aqueduct carries the river over the road by a bridge. In Shropshire the Dee bestrides the valley; it is a remarkable engineering work completed by Thomas Telford in 1805. The Dee has a total length of about 70 m. and a fall of 530 ft. Below Overton it debouches upon its plain track. Below Chester it follows a straight artificial channel to the estuary, and this is the only navigable portion. The estuary, which is 14 m. long, and 34 m. wide at its mouth, between Hilbre Point on the English and Point of Air on the Welsh side, is not a commercial highway like the neighbouring mouth of the Mersey, for though in appearance a fine natural harbour at high tide, it becomes at low tide a vast expanse of sand, through which the river meanders in a narrow channel. The navigation, however, is capable of improvement, and schemes have been set on foot to this end. The tide rushes in with great speed over the sands, and their danger is illustrated in the well-known ballad "The Sands of Dee" by Charles Kingsley. The Dee drains an area of 8,430 sq. m.

DEE, a river in the south of Aberdeenshire, Scotland, pursuing a generally easterly direction from its source in the extreme west of the county till it reaches the North Sea at the city of Aberdeen. It rises in the Wells of Dee, a spring on Ben Braeriach, one of the Cairngorms, at a height of 406 ft. above the sea. It descends rapidly from this altitude, and by the time that it receives the Gussachan, on its right bank, about 6 m. from its source, it has fallen 242 ft. From the mountains flanking its upper reaches it is fed by numerous burns named and unnamed. With its tributaries the river drains an area of 1,000 sq. m. Rapid and turbulent during the first half of its course of 90 m., it broadens appreciably below Aboyne and the rate of flow is diminished. The channel towards its mouth was artificially altered in order to provide increased dock accommodation at Aberdeen, but, above, the stream is navigable for only barges and small craft for a few miles. It runs through scenery of transcendent beauty, especially in Braeriach. About two miles above Inverey it enters a narrow rocky gorge, 500 yds. long and only a few feet wide at one part, and on the far side of the narrow rim of the gorge is the famous Linn of Dee. One of the finest of Scottish salmon streams, it retains its purity almost to the very end of its run. The principal places on the Dee, apart from private residences, are Castleton of Braemar, Ballater, Aboyne, Kincardine O'Neil, Banchory, Culter and Cults.

DEED (in O. Eng. deed, from the stem of the verb "to do") that which is done, an act, doing; particularly, in law, a contract in writing, sealed and delivered by the party bound to the party intended to benefit. Contracts or obligations under seal are called in English law specialities, and down to 1860 they took precedence in payment over simple contracts, whether written or not. Writing, sealing and delivery are all essential to a deed. The signature of the party charged is not material, and the deed is not void for want of a date. Delivery, it is held, may be complete without the actual handing over of the deed; it is sufficient if the act of sealing were accompanied by words or acts signifying that the deed was intended to be presently binding; and delivery to a third person for the use of the party benefited will be sufficient. On the other hand, the deed may be handed over to a third person as an esrow, in which case it will not take effect as a deed until certain conditions are fulfilled. Such conditional delivery may be inferred from the circumstances attending the transaction, although the conditions be not expressed in words. A deed indented, or indenture (so called because the counterparts on the same sheet of parchment, separated by cutting a wavy line between them so as to be identified by fitting the parts together), is between two or more parties who contract mutually. The actual indentation is not now necessary to an indenture. The deed-poll (with a polled or smooth-cut edge, not indented) is a deed in which one party binds himself without reference to any corresponding obligations undertaken by another party. See Contract.

DEEMS, CHARLES (ALEXANDER) FORGE (1820–1893), American clergyman, was born in Baltimore, Maryland, on the 4th of December 1820. He was a precocious child and delivered lectures on temperance and on Sunday schools before he was fourteen years old. He graduated at Dickinson College in 1839, taught and preached in New York city for a few months, in 1840 took charge of the Methodist Episcopal church at Asbury, New Jersey, and removed in the next year to North Carolina, where he became general agent for the American Bible Society. He was professor of logic and rhetoric at the University of North Carolina in 1842–1847, and professor of natural sciences at Randolph-Macon College (then at Boydton, Virginia) in 1847–1848, and after two years of preaching at Newbern, N. C., he held for four years (1850–1854) the presidency of Greensboro (N.C.) Female College. He continued as a Methodist Episcopal clergyman at various pastures in North Carolina from 1854 to 1865, for the last seven years being a presiding elder and in 1859 to 1863 being the proprietor of St Austin's Institute, Wilson. In 1865 he settled in New York City, where in 1866 he began preaching in the chapel of New York University, and in 1868 he established and became the pastor of the undenominational Church of the Strangers, which in 1870 occupied the former Mercer Street Presbyterian church, purchased and given to Dr Deems by Cornelius Vanderbilt; there he remained until his death in New York city on the 18th of November 1893. He was one of the founders (1881) and president of the American Institute of Christian Philosophy, and for ten years was editor of its organ, Christian Thought. Dr Deems was an earnest temperance advocate, as early as 1852 worked (unsuccessfully) for a general prohibition law in North Carolina, and in his later years allied himself with the Prohibition party. He was influential in securing from Cornelius Vanderbilt the endowment of Vanderbilt University, in Nashville, Tennessee. He was a man of rare personal and literary charm; he edited The Southern Methodist Episcopal Pulpit (1846–1852) and The Annals of Southern Methodism (1855–1857); he compiled Devotional Melodies (1842), and, with the assistance of Phoebe Cary, one of his parishioners, Hymns for all Christians (1862; revised, 1881); and he published many books, among which were: The Life of Dr Adam Clarke (1840);
DEER

His Autobiography (New York, 1897) is autobiographical only to 1847, the memoir being completed by his two sons.

DEER (O. E. dior, dior, a common Teutonic word, meaning a wild animal, cf. Ger. Tier, D. dier, &c., probably from a root *dhus*, to breathe), originally the name of one of two British species, the red deer or the fallow deer, but now extended to all the members of the family Cervidae, in the section Pecora of the suborder Artiodactyla of the order Ungulata. (See Pecora; Artiodactyla and Ungulata.) Briefly, deer may be defined as Pecora presenting the following characteristics:—either antlers present in the male, or when these are absent, the upper canines large and sabre-like, and the lateral metacarpal bones represented only by their lower extremities. This definition will include the living and also most of the extinct forms, although in some of the latter the metacarpal bones not only retain their lower ends, but also a stunted upper extremity, as in their carex diagrams.

The leading characters of antlers are described under Pecora, but these structures may be defined somewhat more fully in the following passage from the present writer's Deer of All Lands:

"Antlers are supported on a pair of solid bony processes, or pedicels, arising from the frontal bones of the skull, of which they form an inseparable portion; and if in a fully adult deer these pedicels be sawn through, they will generally be found to form the cores of solid, ivory-like bone, devoid of perceptible channels for the passage of blood-vessels. The pedicels are always covered with skin well supplied with blood-vessels; and in young deer, or those in which the antlers have been comparatively recently shed, the covering of skin and blood-vessels of the antler, as well as of the lower extremities, includes the bone which commences to deposit bone matter. This deposition of bone matter progresses very rapidly, and although in young deer and the adults of some species the resulting antler merely forms a simple spike, in the summit of which is placed a single or bushy tuft of hair, in others of it growth a more or less prominent ring of bone, termed the burr or corona, is deposited at its base just above the junction with the pedicel; this ring tending to constrict the blood-vessels, and thus cut off their nutrition, as long as it remains uneroded, the bone assumes a more or less complexly branched structure. All this time the growing antler is invested with a skin clothed with exceedingly fine hairs, and is most liberally supplied with blood-vessels; this skin is soon shed, and the exposed surface of the bone is covered with hair, the number of hairs forming, as the antler grows, a more or less prominent ring of bone, termed the burr or corona, is deposited at its base just above the junction with the pedicel; this ring tending to constrict the blood-vessels, and thus cut off their nutrition, as long as it remains uneroded, the bone assumes a more or less complexly branched structure.

"When the antlers are freed from the velvet—a process usually assisted by the animal rubbing them against tree stumps or boughs—they have a more or less rugose surface, owing to the grooves formed in them by the nutrient blood-vessels. Although a great many living species have the antlers in the form of simple spikes in the adult male, in the great majority of species they are more or less branched; while in some, like the elk and fallow-deer, they expand into flat and palmate plates, with tined or brow-tined ends, or both.

"In the antlers of the red-deer group, which form the type of the whole series, the following names have been applied to their different component parts and branches. The main shaft is termed the brow-tine; the second tined without and without any bone, or bone at the first of the tines; the third the tine-tine, or royal; and the branched portion forming the summit the crown, or surrroy. But the antlers of all deer by no means conform to this type; and in certain groups other names have to be adopted for the branches.

"The antlers of young deer are in the form of simple spikes; and this form is retained in the South American brockets, although the simple antlers of these deer appear due to degeneration, and are not present in any other species. Two or more antlers, regularly branched like antlers in the adult, and it is doubtful whether such a type is displayed by any known extinct form, although many have a single fork. In the deer of the sambar group, where the antlers never achieve this power of growth, and remain in the form of a single tine, or the same increase in the complexity of the antlers up to a certain period of life, after which they begin to degenerate."

The Cervidae are distributed all over Europe, Asia, Northern Africa, and America, but are unknown in Africa south of the Sahara. They are undoubtedly a group of European or Asiatic origin, and obtained an entrance into Asia at a time when that continent was connected with Asia by way of Bering Strait.

The existing members of the family are classified in the writer's Deer of all Lands as follows:

A. Subfamily Cervinae.—Antlers, with one exception, present in the male; without a gall-bladder, a face-gland, and a gland-pit in the skull.

1. Reindeer, Genus Rangifer.—Lateral metacarpal bones represented only by their lower extremities; antlers present in both sexes, complex, northern part of both hemispheres.

2. Elk, Genus Alces.—Lateral metacarpals as in preceding; antlers (as in the following genera) present only in the male, arising at right angles to the median longitudinal line of the skull, and extending at first in the plane of the forehead, after which, when in their fullest development, they expand into a broad palmation margined with snags. Northern part of both hemispheres.

B. Subfamily Cervinae.—Lateral metacarpals represented only by their upper ends. Antlers arising at acute angles to the median line of the skull (as in the following genera), at first projecting from the plane of the forehead, and then continued upwards to form a tined horn, sometimes branched, and furnished with a brow-tine, never regularly forked at division, but generally of large size, and with not less than three tines; the skull without ridges on the frontal forming the bases of the pedicels of the antlers. In some of the most perfect representatives of this group, the skull is without the brow-tine. Two genera:

1. Red Deer, Genus Cervus.—Antlers rounded, usually with five or more tines, generally including a bez (second), and always a trez (third); coat of adult generally unspotted, with a large light-coloured disk surrounded by a white group, or tzone bordered by black in the region of the tail, which is also black on the rest of the body. Northern and Central Asia and North America.

2. Sika Deer, Genus Pseudaxis.—Antlers smaller and simpler, four-tined, with a trez (third); no bez (second); coat of adult spotted, at least in summer, by a brown group, and in winter of black and white markings in the region of the tail similar to those of Pseudaxis; yellow, spotted. Mediterranean region, but more widely spread in Europe during the Pleistocene epoch, and also introduced into many European countries.

3. Fallow-deer, Genus Dama.—Antlers without a bez, but with a trez (third) above the bez; the tines less, palmated, and generally furnished with numerous snags; coat of adult in summer, uniform in winter, with black and white markings in the region of the tail similar to those of Pseudaxis; young, spotted. Mediterranean region, but more widely spread in Europe during the Pleistocene epoch, and also introduced into many European countries.

4. Sambar Group, Genus Rusa.—Antlers rounded, thinned, with the bez and trez-tines wanting, and the beam simply forked, or tined, or with snags; coat of adult or tzone spotted at all seasons. Indo-Malay countries and part of China.

5. Barasingha Group, Genus Rucervus.—Antlers flattened or rounded, without bez or trez-tine, the beam dichotomously forking, or tined, with snags; coat of adult furnished with numerous snags; coat of adult or tzone spotted or tzone bordered by black in the region of the tail, which is also black on the rest of the body. Indo-Malay countries.

6. Montfays, Genus Cervus.—Lateral metacarpals as in Cervus; antlers small, with a brow-tine and an unbranched beam, supported on long bony pedicels, and never having the number of tines as long as four; brow-tine forming a right angle or a continuous curve with the beam; coat of adult generally more or less uniform, of young spotted. Indo-Malay countries.

7. Tufted Muntjas, Genus Elaphodus.—Nearly related to the last, but the antlers still smaller, with shorter pedicels and divergent frontal ridges; upper canines of male not everted at the tips. Tibet and India.

8. Water-deer, Genus Hydrophas.—Lateral metacarpals as in Rangifer; antlers wanting; upper canines of males tusk-like and growing from semi-persistent puffs; cheek-teeth tall-crowned (brow-tine and trez-tine wanting).

9. Roe-deer, Genus Capreolus.—Lateral metacarpals as in Rangifer; antlers rather small, without a brow-tine or sub-basal sag, dichotomously forked, with the upper proponent of the fork curving forwards and dividing, and the lower long, simple, and projected backwards, the beam making a very marked angle with the plane of the face; tail very long; vemos in Capreolus.

X. American Deer, Genus Massana.—Lateral metacarpals as in Rangifer; antlers very variable in size, forming a marked angle with the plane of the face, without a brow-tine; when consisting of more than a simple proponent, dichotomously forked, with a sub-basal sag, and always with the lower proponent of the fork projected from the front edge of the beam, in some cases the lower, in others
the upper, and in others both prongs again dividing; tail long; tarsal gland generally present; metatarsal gland very variable, both as regards presence and position; vomer dividing the inner aperture of the nostrils in the skull into two distinct chambers. America.

1. White-tailed Group, Subgenus Dicerorhaphus or Odocoileus.—Antlers large and complex, with a sub-basal snag, and the lower prong more or less developed at the expense of the upper one; metatarsal gland usually present; tail long or moderate, and hairy being the rule; face narrow; the face and gland pit absent; the gland-pit in the skull of moderate extent; no upper canines; size generally large. North America to Northern South America.

2. Marsh Deer Group, Subgenus Blastoceros.—Antlers large and complex, without a sub-basal snag, and the upper prong developed at the expense of the lower one; metatarsal gland absent; tail short; face moderately long; face-gland and gland-pit well developed; upper canines usually present in male. Size large or rather small. South America.

3. Subgenus Mazama.—Antlers small and simple, forming a single dichotomous fork; metatarsal gland absent; tail short; face moderately long; face-gland and gland-pit well developed; upper canines present in both sexes. Size medium. South America.

4. Brocket, Subgenus Mazama.—Antlers in the form of simple unbranched spikes; metatarsal, and in one case also the tarsal gland absent; tail very short; face elongated; face-gland small and gland-pit deep and triangular; hair of face radiating from two or three whorls; upper canines sometimes present in old males. Size small. Central and South America.

X. Genus Pudu.—Skull and metacarpals generally in Malayan type; hair short; tail long; upper parts of the body coated with bristle; antlers in the form of short, simple spikes; cannon-bones very short; tail very short or wanting; no whorls in the hair of the face; face-gland moderately large, and gland-pit deep and oval; tarsal and meta-

carpal glands present. Members are usually small, and belong to the tarsal group. South America.

B. Subfamily Moschini.—Antlers wanting in both sexes; liver furnished with a gall-bladder; no face-gland or gland-pit.

XI. Musk-deer, Genus Moschus.—Hair short and brittle; antlers simple; upper canines small or wanting; no tarsal or metatarsal glands or tufts; lateral metacarpals represented by their lower extremities; lateral hoofs very small; tail very short; naked portion of muzzle extensive; male with a large abdominal gland. Central Asia.

Of the above, Reindeer and Elk are dealt with in separate articles (q.v.).

The first or typical group of the genus Cervus includes the red-deer (Cervus elaphus) of Europe and western Asia, of which there are several local races, such as the large C. elaphus maral of eastern Europe and Persia, which is often partially spotted above and dark-coloured below, the smaller C. e. barbarus of Tunisia and Morocco, and the still smaller C. e. corsicanus of Corsica. The Scandinavian red-deer is the typical form of the species. In all red-deer the antlers are rounded, and show a more or less marked tendency to form a cup at the summit. Wapiti, on the other hand, show a marked tendency to the flattening of the antlers, with a great development of the fourth tine, which is larger than all the others, and the whole of the tines above this in the same plane, or nearly so, this plane being the same as the long axis of the animal. Normally no cup is developed at the summit of the antler. The tail, too, is shorter than in the red-deer; while in winter the under parts become very dark, and the upper surface often bleaches almost white. The cry of the stags in the breeding season is also different. The typical representative of the group is the North American wapiti C. canadensis, but there are several closely allied races in Central Asia, such as C. canadensis eurasicus, of Turkestan, while in Manchuria the subgroup is represented by C. c. zanthopygus, in which the summer coat is reddish instead of grey. The hangul (C. c. mirianus) of Kashmir is a distinct dark-coloured species, in which the antlers tend to turn in at the summit; while C. yarcardensis, of the Tarim Valley, Turkestan, is a redder animal, with a wholly rufous tail, and antlers usually terminating in a simple fork placed in a transverse plane. Another Asiatic species is the great shou (C. affinis) of the Chumbi Valley, in which the antlers curve forwards in a remarkable manner. Lastly C. alboiristis, of Tibet, is easily recognized by its white muzzle, and smooth, whitish, flattened antlers, which have fewer tines than those of the other members of the group, all placed in one plane.

The second group of the genus Cervus, forming the subgenus Pseudaxis, is typified by the handsome little Japanese deer, or sika, C. (P.) sika, in which the antlers are four-tined, and covered with red “velvet” when first grown, while the coat is fully spotted in summer, but more or less uniformly brown in winter. The most distinctive feature of the deer of this group is, however, the patch of long erectile white hairs on the buttocks, which, although inconspicuous when the animals are quiescent, is expanded into a large chrysantheme-like bunch when they start to run or are otherwise excited. The patch then forms a guiding signal for the members of the herd when in flight. On the mainland of Manchuria both the typical sika, and a larger race (C. sika manchuricus), occur. A still larger and finer animal is the Pekin sika (C. hortulorum), of northern Manchuria, which is as large as a small red-deer; it is represented in the Yang-tze valley by a local race, C. h. kopschi. Formosa possesses a species of its own (C. tawanus), which, in correlation with the perpetual verdure of that island, is spotted at all seasons.

For the fallow-deer, Cervus [Dama] dama, see FALLOW-DEER.

The rusine or sambar group of Cervus, of which the characteristics are given above, comprises a considerable number of long-tailed species with three-tined antlers from the Indo-Malay countries and some parts of China. The largest and handsomest is the sambar of India (Cervus [Rucervus] unicolor), characterized by its massive and rugged antlers. It is represented by a number of local races, mostly of smaller size, such as the Burmese and Malay C. u. equinus, the Formosan C. u. swinhoei, and the Philippine C. u. philippinus and C. u. mignons, of which the latter is not larger than a roe-buck, while the sambar itself is as large as a red-deer. Whether these local phases of a single variable type are best denominated races or species, must be largely a matter of individual opinion. The rusine, or Javan sambar, C. (R.) hippelaphus, is a lighter-coloured and smaller deer than the Indian sambar, with longer, slenderer and less rugged antlers. Typically from Java, this deer is also represented in the Moluccas and Timor, and has thus the most easterly range of the whole tribe. A black coat with white spots distinguishes the Philippine spotted deer, C. alfredi, which is about the size of a roe-buck; while other members of this group are the Calamans deer of the Philippines (C. cuilensis), the Bavian deer (C. kuhl), from a small island near Java, and the well-known hog-deer or para (C. porcinus), all these three being small, more or less uniformly coloured, and closely allied species.

On the other hand, the larger and handsomer chital, or spotted deer (C. axis), stands apart by its white-spotted fawn-red coat and differently formed antlers.

Nearly allied to the preceding is the barasingha or rucervine group (subgenus Rucervus), in which the antlers are of a different and generally more complex character. The typical species is the Indian barasingha or swamp-deer, Cervus (Rucervus) duvaucel, a uniformly red animal, widely distributed in the forest districts of India. In Siam it is replaced by C. (R.) schombergki, in which the antlers are of a still more complex type. Finally, we have the thamin, or Eld’s deer, C. (R.) eldi, ranging from Burma to Siam, and characterized by the continuous curve formed by the beam and the brow-tine of the antlers.

For the small eastern deer, respectively known as muntjac (Cerorinus) and tufted muntjacs or tufted deer (Elaphodus), see MUNTJAC, while under WATSON-DEER will be found a notice of the Chinese representative of the genus Hydro-plotes. The roe-deer, or roe-buck (Capreolus), likewise form the subject of a separate article (see ROE-BUCK), as is also the case with Père David’s deer, the sole representative of the genus Elaphurus.

The American deer include such New World species as are generally distinct from Old World types. All these differ from the members of the genus Cervus in having no brow-tine to the antlers, which, in common with those of the roe-deer, belong to what is called the forked type. Including all these deer except one in the genus Mazama (of which the typical representatives are the South American brockets), the North American species constitute the subgenus Dorcupalphus (also known as Caricus and Odocolus). One of the best known of these is the white-tailed deer Mazama (Dorcupalphus) americana, often known as the Virginian deer. It is typically an animal of the size of a fallow-deer,
DEERFIELD—DEER PARK

reddish in summer and greyish in winter, with a long tail, which is coloured like the back above but white below, and is carried elevated when the animal is running, so as to form with the white of the inner sides of the buttocks a conspicuous "blaze." A white fetlock-gland with a black centre is also distinctive of this species. The antlers are large and curve forwards, giving off an upright snag near the base, and several vertical tines from the upper surface of the horizontal portion. As we proceed southwards from the northern United States, deer of the white-tailed type decrease steadily in size, till in Central America, Peru and Guiana they are represented by animals not larger that a roebuck. The most convenient plan appears to be to regard all these degenerate forms as local races of the white-tail, although here again there is room for difference of opinion, and many naturalists prefer to call them species. The large ears, brown-and-white face, short, black-tipped tail, and antlers without large basal snag serve to distinguish the mule-deer (M. [D.] hemionus), of western North America; while the black-tailed (M. [D.] columbianus), ranging from British Columbia to California, is a smaller animal, recognizable by the longer and longer tail, which is black above and white below.

South America is the home of the marsh-deer or guazu, (Blastocerus) dichotoma, representing a subgenus in which the complex antlers lack a basal snag, while the hair of the back is reversed. This species is about the size of a red-deer, with a foxy red coat with black legs. The pampas-deer, (M. B.) bloopica, of the Argentine pampas is a much smaller animal, of paler colour, with three-tined antlers. The Chilean and Peruvian Andes and Patagonia are the homes of two peculiar deer locally known as guemals (huemals), and constituting the subgenus Xenelaphus, or Hippocamenes. They are about the size of fallow-deer, and have simply forked antlers. The Chilean species is (M. B.) bisulca and the Peruvian (M. B.) antilis. Brocket deer, (M. ratus) and (M. nemoratina), are Central and South American deer of the same roebucks size, with small spike-like antlers, tufted heads and the hair of the face radiating from two whorls on the forehead so that on the nose the direction is downward. The smallest of all deer is the Chilian pudu (Pudu pudu), a creature not much larger than a hare, with almost rudimentary antlers.

The musk-deer forms the subject of a separate article.

For deer in general, see R. Lydekker, The Deer of all lands (London, 1898, 1908).

DEERFIELD, a township of Franklin county, Massachusetts, U.S.A., on the Connecticut and Deerfield rivers, about 33 m. N. of Springfield. Pop. (1900) 1969; (1910 U.S. census) 2209. Deerfield is served by the Boston & Maine and the New York, New Haven & Hartford railways. The natural beauty and the historic interest of Deerfield attract many visitors. There are several villages and hamlets in the township, the oldest and most important is that known as "The Street" or "Old Street." This extends along one wide thoroughfare over a hill and across a plateau or valley that is hemmed in on the E. by a range of highlands known as East Mountain and on the W. by the foothills of Hoosac Mountain. Many of the houses in this village are old. In Memorial Hall, a building erected in 1797-1798 for the Deerfield academy, the Pocumtuck Valley memorial association (incorporated in 1870) has gathered an interesting collection of colonial and Indian relics. Deerfield was one of the first places in the United States to enter into the modern "Arts and crafts movement"; in 1896 many of the old household industries were revived and placed upon a business basis. Most of the work is done by women in the homes. The products, including needlework and embroidery, textiles, rag rugs, netting, wrought iron, furniture, and metal-work in gold and silver embellished with precious and semi-precious stones, are exhibited in an old-fashioned house built in 1731; a large portion of them are sold to tourists. There is an arts and crafts society, but the profits from the sales go entirely to the workers.

The territory which originally constituted the township of Deerfield (known as Pocumtuck until 1674) was a tract of 8000 acres granted in 1654 to the town of Dedham in lieu of 2000 acres previously taken from that town and granted to Rev. John Eliot to further his mission among the Natick Indians. The rights of the Pocumtuck Indians to the Deerfield tract were purchased at about fourpence per acre, settlement was begun upon it in 1660, and the township was incorporated in 1673. For many years Deerfield was the N.W. frontier settlement of New England. It was slightly fortified at the beginning of King Philip's War, and after an attack by the Indians on the 1st of September 1675 it was garrisoned by a small force under Capt. Samuel Appleton. A second attack was made on the 12th of September, and six days later, as Capt. Thomas Lothrop and his company were guarding teams that were hauling wheat from Deerfield to the English headquarters at Hadley, they were surprised by Indians in ambush at what has since been known as Bloody Brook (in the village of South Deerfield), and Lothrop and more than sixty of his men were slain. From this time until the end of the war Deerfield was abandoned. In the spring of 1677 a few of the old settlers returned but on the 9th of September some were killed and the others were captured by a party of Indians from Canada. Resettlement was undertaken again in 1682. On the 15th of September 1694 Deerfield narrowly escaped capture by a force of French and Indians from Canada. In the early morning of the 29th of February 1703-1704, Deerfield was surprised by a force of French and Indians (under Hertel de Rouville), who murdered 49 men, women and children, captured 111, burned the town, and on the way back to Canada murdered 20 of the captured. Among the captives was the Rev. John Williams (1664-1729), the first minister of Deerfield, who (with the other captives) was redeemed in 1706 and continued as pastor here until his death; in 1707 he published an account of his experiences as a prisoner, The Redeemed Captive Returning to Zion, which has frequently been reprinted. From the original township of Deerfield the territory of the following townships has been taken: Greenwood (1753 and 1806), Conway (1797, 1798 and 1811), Shelburne (1818) and a part of Whately (1810).

DEER PARK, an enclosure of rough wooded pastureland for the accommodation of red- or fallow-deer. The distinction between a deer "park" and a deer "forest" is that the former is always enclosed either by a wall or fence, and is relatively small, whereas the forest covers a much larger area, and is not only open but sometimes contains practically no trees at all. Originally, the possession of a deer park in England was a royal prerogative, and no subject could enclose one without a direct grant from the crown—a licence to impark, as a licence to embattled a house, was always necessary. When Domesday Book was compiled, there were already thirty-one deer parks in England; many of these may have existed in Saxon times; about one-fourth of them belonged to the king. After the Conquest they increased rapidly in number, but from about the middle of the 11th century this tendency was reversed. In the middle of the 16th century it was conjectured that one-twentieth of England and Wales was given up to deer and rabbits. Upon Saxton's maps, which were made between 1575 and 1580, over 700 parks are marked, and it is not improbable that the number was underestimated. Mr Evelyn Philip Shirley enumerated only 334 in his book on English Deer Parks published in 1867. To these Mr Joseph Whitaker, in A Descriptive List of the Deer Parks of England (1892), has added another fifty, and the total is believed to be now about 400. It is a curious circumstance that despite the rather minute detail of Domesday none of the parks there enumerated can now be identified. There is, however, a plausible case for Erigde Park in Sussex as the Reredfelle of Domesday. The state and condition of the great barons of the middle ages depended in some measure upon the number of deer parks which they possessed. Most bishops and abbots had one or two, and at one time more than twenty were attached to the archbishopric of Canterbury. When the power of the barons was finally broken and a more settled period began with the accession of the house.
DEFA McM—DEFENDER OF THE FAITH
925

of Tudor, the deer park began to fall into decay. By Queen
Elizabeth's time a considerable proportion of the ancestral
areas of the great herds had passed into the possession of rich
merchants and wealthy wool-staplers, and it became more
profitable to breed bullocks than to find pasture for deer, and
even where the new men retained, and even in some cases created,
deer parks, they reduced their area in order that more land might
be available for grazing or for corn. Thus began that decadel
cence of the deer park which has continued down to the present
time. More than anything, however, the strife between Charles I.
and parliament contributed to reduce both the number and size
of English parks containing deer. By the Restoration the major-
ty of the parks in England had for the time being been destroyed,
the palings pulled down, the trees felled, and the deer stoned.
Of the duke of Newcastle's eight parks seven were ruined,
that at Welbeck alone remaining intact. Not a tree was left in
Clipperton Park, although the timber had been valued at £30,000.
One of the results of the Restoration was to empty the parks of
the Roundhead squires to replenish those of the Royalists, but
this measure helped little, and great numbers of deer had to
be brought from Germany to replenish the depleted stock.
A gentleman of the Isle of Ely was indeed given a barony in
return for a large present of deer which he made to Charles II.
The largest existing deer park in England is that at Savernake
(4000 acres), next comes Windsor, which contains about 2600
acres in addition to the 1450 acres of Windsor Forest. Lord
Erington of Tatton's park at Tatton in Cheshire, and Lord
Abergavenny's at Eridge, each contain about 2500 acres. Other
parks which are much about the same size are those of Blenheim,
Richmond, Eastwell, Duncombe, Grimsthorpe, Thoresby
and Knowsley. All these parks are famous either for their size,
their beauty, or the number and long descent of the deer which inhabit
them. The size of English parks devoted to deer varies from that
of these historic examples down to a very few acres. A small
proportion of the older enclosures contains red as well as fallow-
deer. In some of the larger ones many hundreds of head browse,
whereas those of the smallest size may have only a dozen or two.
Although many enclosures were disestablished in very recent times,
the 19th century saw the making of a considerable number
of new ones, usually of small dimensions. The tendency, however,
is still towards diminution both in number and extent, cattle
taking the place of deer.

DEFAMATION (from the classical Lat. difamare, to spread
abroad an evil report—the English form in de is taken from the
Late Lat. defamare), the saying or writing something of another,
calculated to injure his reputation or expose him to public hatred,
contempt and ridicule. (See Libel and Slander.)

DEFAULT (Fr. défaut, from défauter, to fail, Lat. fallere), in
English law, a failure to do some act required by law either as a
regular step in procedure or as being a duly imposed. Parties
in an action may be in default as to procedure by failure to appear
to the writ, or to take some other step, within the prescribed
time. In such cases the opposing party gains some advantage by being
allowed to sign judgment or otherwise. But as a rule, unless the
party is much in default and is under a peremptory order to proceed,
the remedy for default is by order to pay the costs of
occasioned. When there is default in complying with the terms
of a judgment the remedy is by executing it by one of the
processes admitted by the law. (See Execution.) In the case
of judgments in criminal or quasi-criminal cases, where a fine
is imposed, it is in most cases legal and usual to order imprisonment
if the fine is not paid or if the property of the defendant is insufficient to realize its amount.
Default in compliance with a statute renders the defaulter liable to action
by the person aggrieved or to indictment if the matter of command is of public concern, subject in either case to the
qualification that the statute may limit the remedy for the
default to some particular proceeding specifically indicated;
and in some instances, e.g. in the case of local authorities,
default in the execution of their public duties is dealt with administratively by a government, and only in the last resort, if at all, by recourse to judicial tribunals.

DEFENCE. OR DEFENCE (Fr. défence, to undo), in law,
an instrument which defeats the force or operation of some other
deed or estate; as distinguished from condition, that which in
the same deed is called a condition is a defeasance in another deed.
A defeasance should recite the deed to be defeated and its date,
and it must be made between the same parties as are interested
in the deed to which it is collateral. It must be of a thing
defeasible, and all the conditions must be strictly carried out
before the defeasance can be consummated. Decease in a
bill of sale is the putting an end to the security by realizing
the goods for the benefit of the mortgagee. It is not strictly a
defeasance, because the stipulation is in the same deed; it is
really a condition in the nature of a defeasance.

DEFE NCE (Lat. defendere, to defend), in general, a keeping
off or defending, a justification, protection or guard. Physical
defence of self is the right of every man, even to the employment
of force, in warding off an attack. A person attacked may use
such force as he believes to be necessary for the warding off an
attack, even to the extent of killing an assailant. The same
right of reciprocal defence extends not only to defence of one's own
person, but also to defence of the life, liberty, or property of
wife, parent or child, master or servant. (See Assault; Homicide.) As a legal
term in English pleading, "defence" means the denial by the party
proceeded against of the validity of a charge, or the steps
taken by an accused person or his legal advisers for defending
himself. In civil actions, a statement of defence is the second
step in proceedings, being the answer of the defendant to the
plaintiff's statement of claim. In the statement of defence must be set out every material fact upon which the defendant intends
to rely at the trial. Every fact alleged in the statement of claim
must be dealt with, and either admitted or denied; further facts
may be pleaded in answer to those admitted; the whole pleading
of the plaintiff may be objected to as insufficient in law, or a set-off
or counter-claim may be advanced. A statement of defence
must be delivered within ten days from the delivery of the
statement of claim, or appearance if no statement of claim be
delivered.

By the Poor Prisoners' Defence Act 1903, where it appears,
having regard to the nature of the defence set up by any poor
prisoner, as disclosed in the evidence given or statement made
by him before the committing justices, that it is desirable in
the interests of justice that he should have legal aid in the prepara-
tion and conduct of his defence, and that his means are insuffi-
cient to enable him to obtain such aid, it may be ordered either
(1) on committal for trial by the committing justices, or (2) after
reading the depositions by the judge or quarter sessions chairman.
The defence includes the services of solicitor and counsel and the
expenses of witnesses, the cost being payable in the same manner
as the expenses of a prosecution for felony. Briefly, the object
of the act is, not to give a prisoner legal assistance to find out if
he has got a defence, but in order that a prisoner who has a defence
may have every inducement to tell the truth about it at the
earliest opportunity. Legal assistance under the act is only
given where both (1) the nature of the defence as disclosed is
such that in the interests of justice the prisoner should have
legal aid to make his defence clear, and (2) where his means are insufficient for that end (Lord Alverstone, C.J., at
Warwick Summer Assizes, The Times, July 26, 1904).

DEFENDANT, in law, a person against whom proceedings
are instituted or directed; one who is called upon to answer
in any suit. At one time the term "defendant" had a narrower
meaning, that of a person sued in a personal action only, the
corresponding term in a real action being "tenant," but the
distinction is now practically disregarded, except in a few states
of the United States.

DEFENDER OF THE FAITH (Fidei Defensor), a title belonging
to the sovereign of England in the same way as Christianissimus
belonged to the king of France, and Catholicus belongs to the ruler
of Spain. It seems to have been suggested in 1516, and although
certain charters have been appealed to in proof of an earlier use
of the title, it was first conferred by Pope Leo X. on Henry VIII.
The Bull granting the title is dated the 11th of October 1521,
and was a reward for the king's treatise, *Assertio, septem sacramentorum*, against Luther. When Henry broke with the papacy, Pope Paul III. deposed him of this designation, but in 1544 the title of "Defender of the Faith" was confirmed to Henry by parliament, and has since been used by all his successors on the English throne.

**DEFERENT** (Lat. *deferens*, bearing down), in ancient astronomy, the mean orbit of a planet, which carried the epicycle in which the planet revolved. It is now known to correspond to the actual orbit of the planet round the sun.

**DEFFAND, MARIE ANNE DE VICHY-CHAMROND, MARQUISE DU** (1697–1780), a celebrated Frenchwoman, was born at the chateau of Chamrond near Charolles (department of Saône-et-Loire) of a noble family in 1697. Educated at a convent in Paris, she showed, along with great intelligence, a sceptical and cynical turn of mind. The abbess, alarmed at the freedom of her views, arranged that Massillon should visit and reason with her, but he accomplished nothing. Her parents married her at twenty-one years of age to a kinsman, Jean Baptiste de la Lande, marquis de Deffand, without consulting her inclination. The union proved an unhappy one, and resulted in a separation as early as 1722. Madame de Deffand, young and beautiful, is said by Horace Walpole to have received him in her apartments, the duke of Orleans (Walpole to Gray, January 25, 1766). She appeared in her earlier days to be incapable of any strong attachment, but her intelligence, her cynicism and her *esprit* made her the centre of attraction of a brilliant circle. In 1721 began her friendship with Voltaire, but their regular correspondence dates only from 1736. She spent much time at Sceaux, at the court of the duchesse du Maine, where she contrived a close friendship with the president Hénault. In Paris she was in a sense the rival of Madame Geoffrin, but the members of her salon were drawn from aristocratic society more than from literary cliques. There were, however, exceptions. Voltaire, Montesquieu, Fontenelle and Madame de Staël-Delaunay were among the habitués. When Hénault introduced D'Alembert, Madame de Deffand was at once captivated by him. With the encyclopaedists she was never in sympathy, and appears to have tolerated them only for his sake. In 1752 she retired from Paris, intending to spend the rest of her days in the country, but she was persuaded by her friends to return. She had taken up her abode in 1747 in apartments in the convent of St Joseph in the rue St Dominique, which had a separate entrance. It was here that she established Mademoiselle de Lespinaise to help her in entertaining. This lady's wit made some of the guests, D'Alembert among others, prefer her society to that of Madame de Deffand, and she arranged to receive her friends for an hour before the appearance of her patron. When this state of things was discovered Mademoiselle de Lespinaise was dismissed (1764), but the salon was broken up, for she took with her D'Alembert, Turgot and the literary clique generally. From this time Madame de Deffand very rarely received any literary men. The principal friendships of her later years were with the duchesse de Choiseul and with Horace Walpole. Her affection for the latter, which dated from 1765, was the strongest and most durable of all her attachments. Under the stress of this tardy passion she developed qualities of style and eloquence of which her earlier writings had given little promise. In the opinion of Sainte-Beuve the prose of her letters ranks with that of Voltaire as the best of that classical epoch without excepting any even of the great writers. Walpole refused at first to acknowledge the closeness of their intimacy from an exaggerated fear that he might lose her sight in 1750, when he paid several visits to Paris expressly for the purpose of enjoying her society, and maintained a close and most interesting correspondence with her for fifteen years. She died on the 23rd of September 1780, leaving her dog Tonton to the care of Walpole, who was also entrusted with her papers. Of her innumerable witty sayings the best known is her remark on the cardinal de Polignac's account of St Denis's miraculous walk of two miles with his head in his hands,—"Il n'y a que le premier pas qui coûte."

The Correspondance inédite of Madame de Deffand with D'Alembert, Hénault, Montesquieu, and others was published in Paris (2 vols.) in 1809. Letters of the marquise de Deffand to the Hon. Horace Walpole, afterwards earl of Orford, from the year 1706 to the year 1780 (4 vols.), edited with a biographical sketch, by Miss Mary Berry, were published in London from the originals at Strawberry Hill in 1810. The standard edition of her letters is the Correspondance complète de la marquise de Deffand . . . by M. de Lescure (1865); the Correspondance inédite with M. and Mme de Choiseul and others was edited in 1870 and again in 1886 by the marquis de Sén-Raoul. Other papers of Madame de Deffand obtained at the breaking up of Walpole's collection are in private hands. Madame de Deffand returned many of Walpole's letters at his request, and subsequently none of those which he received from her. Those in his possession appear to have been destroyed after his death by Miss Berry, who printed fragments from them as footnotes to the edition of 1810. The correspondence between Walpole and Madame de Deffand thus begins in 1727, and is one-sided, but seven of Walpole's letters to her are printed for the first time in the edition (1903) of his correspondence by Mrs Paget Toynbee, who discovered a quantity of her unedited letters. See Sainte-Beuve, *Causescus du lundi*, vols. i. and xiv.; and the notice by M. de Lescure in his edition of the correspondence.

**DEFANCE**, a city and the county seat of Defiance county, Ohio, U.S.A., at the confluence of the Auglaize and Tiffin rivers with the Maumee, about 30 m. S.W. of Toledo. Pop. (1890) 7570; (1900) 7273. It is served by the Baltimore and Ohio and the Ohio Electric railways to Lima (42 m.). The city command a fine view of the rivers and the surrounding country, which is well adapted to agriculture; and has large machine shops and several flour mills, besides manufactories of agricultural implements, wagons, sashes and blinds, and wood-working machinery for the manufacture of artillery wheels. Here, too, is Defiance College, an institution of the Christian Denomination, opened in 1885. Defiance was long the site of an Indian village. In 1794 General Anthony Wayne built a fort here and named it Defiance. In 1822 Defiance was laid out as a town; in 1845 it was made the county seat of the newly erected county; and in 1881 it became a city of the second class.

**DEFILE,** a military expression for a passage, to march through which troops are compelled to "defile," or narrow their front (from the Fr. *défiler*, to march in a line, or by *files*). The word is usually applied to a ravine or gorge in a range of hills, but a causeway over a river, a bridge and even a village may equally be called a defile. The term is also used to express, without any reference to military operations, a gorge in mountains. The verb "to defile" is used of trampling upon, marching on a narrow front, or narrowing their front, under all circumstances, and in this sense is the contrary of "deploy."

"Defile," in the sense of "pollute," is another form of "defoul"; though spelt alike, the two words are pronounced differently, the accent being on the first syllable for the former and on the second for the latter.

**DEFINITION** (Lat. *definition*, from *de-finire*, to set limits to, describe), a logical term used popularly for the process of explaining, or giving the meaning of, a word, and also in the concrete for the proposition or statement in which that explanation is expressed. In logic, definition consists in determining the qualities which belong to given concepts or universals; it is not concerned with individuals, which are marked by an infinity of peculiarities, any one or all of which might be predicated of another individual. Individuals can be defined only in so far as they belong to a single kind. According to Aristotle, definition is the statement of the essence of a concept (διαφάνοι μοι το τοῦ θεο ὁ το τῆς τῆς συννεφίς, *Posterior Analytics*, B iii. 90 b 30); that is, saying the genus and the differentia. In other words, "man." is defined as "*animal*," or "*rational animal*" (i.e. the concept is (1) referred to the next higher genus, and (2) distinguished from other modes in which that genus exists, i.e. from other species. It is sometimes argued that, there being no definition of individuals as such, definition is of names (see J. S. Mill, *Logic*, i. viii. 5), not of things; it is generally, however, maintained that definition is of *things*, regarded as, or

"Rational animal" is thus the predicate of the statement constituting the definition. Sometimes the word "definition" is used to signify merely the predicate.
in so far as they are, of a kind. Definition of words can be nothing more than the explanation of terms such as is given in a dictionary.

The following rules are generally given as governing accurate definition. (1) The definition must be equivalent or commensurate with that which is defined; it must be applicable to all the individuals included in the concept and to nothing else. Every man, and nothing else, is a rational animal. "Man is mortal" is not a definition, for mortality is predicable of irrational animals. (2) The definition must state the essential attributes; a concept cannot be defined by its accidental attributes; those attributes must be given which are essential and primary. (3) The definition must be per genus et differentiam (or differentia), as we have already seen. These are the important rules. Three minor rules are: (4) The definition must not contain the name of the concept to be defined; if it does, no information is given. Such a proposition as "an archdeacon is one who performs archidiaconal functions" is not a definition. Concepts cannot be defined by their correlatives. Such a definition is known as a circulus in definitione. (5) Obscure and figurative language must be avoided, and (6) Definitions must not be in the negative when they can be in the affirmative.

**DEFOE, DANIEL** (c. 1659–1731), English author, was born in the parish of St Giles, Cripplegate, London, in the latter part of 1659 or early in 1660, of a nonconformist family. His grandfather, Daniel Foe, lived at Etton, Northamptonshire, apparently in comfortable circumstances, for he is said to have kept a pack of hounds. As to the variation of name, Defoe or Foe, its owner signed either indifferently till late in life, and where his initials occur they are sometimes D. F. and sometimes D. D. F. Three autograph letters of his are extant, all addressed in 1705 to the same person, and signed respectively D. Foe, de Foe and Daniel Defoe. His father, James Foe, was a butcher and a citizen of London.

Daniel was well educated at a famous dissenting academy, Mr Charles Morton's of Stoke Newington, where many of the best-known nonconformists of the time were his schoolfellows. With few exceptions all the known events of Defoe's life are connected with authorship. In the older catalogues of his works, two pamphlets, *Speculum Crapegnonorum*, a satire on the clergy, and *A Treatise against the Turks*, are attributed to him before the accession of James II., but there seems to be no publication of his which is certainly genuine before *The Character of Dr Annesley* (1692). He had, however, before this, taken up arms in Monmouth's expedition, and is supposed to have owed his lucky escape from the clutches of the king's troops and the law, to his being a Londoner, and therefore a stranger in the west country. On the 26th of January 1668 he was admitted a livewoman of the city of London, having claimed his freedom by birth. Before his western escape he had taken up the business of hosier factor. At the entry of William and Mary into London he is said to have served as a volunteer soldier "gallantly mounted and richly accoutred." In these days he lived at Tottenham, and was instrumental in forming a dissenting congregation there. His business operations at this period appear to have been extensive and various. He seems to have been a sort of commission merchant, especially in Spanish and Portuguese goods, and at some time to have visited Spain on business. In 1692 he failed for £10,000. His misfortunes made him write both feelingly and forcibly on the bankruptcy laws; and although his creditors accepted a composition, he afterwards honourably paid them in full, a fact attested by independent and not very friendly witnesses. Subsequently, he undertook first the secretariery and then the management and chief ownership of some tile-works at Tilbury, but here also he was unfortunate, and his imprisonment in 1703 brought the works to a standstill, and he lost £3000. From this time forward we hear of no settled business in which he engaged.

The course of Defoe's life was determined about the middle of the reign of William III. by his introduction to that monarch and other influential persons. He frequently boasts of his personal intimacy with the "glorious and immortal" king, and in 1695 he was appointed accountant to the commissioners of the glass duty, an office which he held for four years. During this time he produced his *Essay on Projects* (1698), containing suggestions on banks, road-management, friendly and insurance societies of various kinds, idiot asylums, bankruptcy, academies, military colleges, high schools for women, &c. It displays Defoe's lively and lucid style in full vigour, and abounds with ingenious thoughts and apt illustrations, though it illustrates also the unsystematic character of his mind. In the same year Defoe wrote the first of a long series of pamphlets on the then burning question of occasional conformity. In this, for the first time, he showed the unlucky independence which, in so many other instances, united all parties against him. While he pointed out to the dissenters the scandalous inconsistency of their playing fast and loose with sacred things, yet he denounced the impropriety of requiring tests at all. In support of the government he published, in 1698, *An Argument for a Standing Army*, followed in 1700 by a defence of William's war policy called *The Two Great Questions considered*, and a set of pamphlets on the Partition Treaty. Thus in political matters he had the same fate as in the matter of the Whigs were not much prepared than the Tories to support William through thick and thin. He also dealt with the questions of stock-jobbing and of electioneerings corruption. But his most remarkable publication at this time was *The True-Born Englishman* (1701), a satire in rough but extremely vigorous verse on the national objection to William as a foreigner, and on the claim of purity of blood for a nation which Defoe chooses to represent as crossed and dashed with all the strains and races in Europe. He also took a prominent part in the proceedings which followed the Kentish petition, and was the author, some say the presenter, of the *Legion Memorial*, which asserted in the strongest terms the supremacy of the electors over the elected, and of which even an irate House of Commons did not dare to take much notice. The theory of the indefeasible supremacy of the freeholders of England, whose delegates merely, according to this theory, the Commons were, was one of Defoe's favourite political tenets, and he returned to it in a powerfully written tract entitled *The Original Power of the Collective Body of the People of England examined and asserted* (1701).

At the same time he was occupied in a controversy on the conformity question with John How (or Howe) on the practice of "occasional conformity." Defoe maintained that the dissenters who attended the services of the English Church on particular occasions to qualify themselves for office were guilty of inconsistency. At the same time he did not argue for the complete abolition of the tests, but desired that they should be so framed as to make it possible for most Protestants conscientiously to subscribe to them. Here again his moderation pleased neither party.

The death of William was a great misfortune to Defoe, and he soon felt the power of his adversaries. After publishing *The Mock Mourners*, intended to satirize and rebuke the outbreak of Jacobite joy at the king's death, he turned his attention once more to ecclesiastical subjects, and, in an evil hour for himself, wrote the anonymous *Shortest Way with the Dissenters* (1702), a statement in the most forcible terms of the extreme "high-flying" position, which some high churchmen were unaccustomed enough to enter into, without any suspicion of the writer's ironical intention. The author was soon discovered; and, as he absconded, an advertisement was issued offering a reward for his apprehension, and giving the only personal description we possess of him, as "a middle-sized spare man about forty years old, of a brown complexion and dark brown-coloured hair, but wears a wig; a hooked nose, a sharp chin, grey eyes, and a large mole near his mouth." In this conjecture Defoe had really no friends, for the dissenters were as much alarmed at his book as the high-flyers were irritated. He surrendered, and his defence appears to have been injudiciously conducted; at any rate he was fined 200 marks, and condemned to be pilloried three times, to be imprisoned indefinitely, and to find sureties for his good behaviour during seven years. It was in this reference to that incident that Pope, whose Catholic rearing made him detest
the abettor of the Revolution and the champion of William of Orange, wrote in the Dunciad—

"Earless on high stands unash'd Defoe"—though he knew that the sentence to the pillory had long ceased to entail the loss of ears. Defoe's exposure in the pillory (July 29, 30, 31) was, however, rather a triumph than a punishment, for the populace took his side; and his Hymn to the Pillory, which he soon after published, is one of the best of his poetical works. Unluckily for him his condemnation had the indirect effect of destroying his business at Tilbury.

He remained in prison until August 1704, and then owed his release to the intercession of Robert Harley, who represented his case to the queen, and obtained for him not only liberty but pecuniary relief and employment, which, of one kind or another, lasted until the termination of Anne's reign. Defoe was uniformly grateful to the minister, and his language respecting him is in curious variance with that generally used. There is no doubt that Harley, who understood the influence wielded by Defoe, made some conditions. Defoe says he received no pension, but his subsequent fidelity was at all events indirectly rewarded; moreover, Harley's moderation in a time of the extremest party-insanity was no little recommendation to Defoe. During his imprisonment he was by no means idle. A spurious edition of his works having been issued, he himself produced a collection of twenty-two treatises, to which some time afterwards he added a second group of eighteen more. He also wrote in prison many short pamphlets, chiefly controversial, published a curious work on the famous storm of the 26th of November 1703, and started in February 1704 perhaps the most remarkable of all his projects, The Review. This was a paper which was issued during the greater part of its life three times a week. It was entirely written by Defoe, and extends to eight complete volumes and some few score numbers of a second issue. He did not confine himself to news, but wrote something very like finished essays on questions of policy, trade and domestic concerns; he also introduced "Theatrical and Political Club," in which minor questions of manners and morals were treated in a way which undoubtedly suggested the Tallers and Spectators which followed. Only one complete copy of the work is known to exist, and that is in the British Museum. It is probable that if bulk, rapidity of production, variety of matter, originality of design, and excellence of style be taken together, hardly any author can show a work of equal magnitude. After his release Defoe went to Bury St Edmunds, though he did not interrupt either his Review or his occasional pamphlets. One of these, Giving Alms No Charity, and Employing the Poor a Grievance to the Nation (1704), is extraordinarily far-sighted. It denounces both indiscriminate alms-giving and the national work-shops proposed by Sir Humphrey Mackworth.

In 1705 appeared The Consolidator, or Memoirs of Sundry Transactions from the World in the Moon, a political satire which is supposed to have given some hints for Swift's Gulliver's Travels; and at the end of the year Defoe performed a secret mission, the first of several of the kind, for Harley. In 1706 appeared the True Relation of the Apparition of one Mrs Veal, long supposed to have been written for a bookseller to help off an unsaleable translation of Drelincourt, On Death, but considerable doubt has been cast upon this by William Lee. Defoe's next work was Jure divino, a long poetical argument in (bad) verse; and soon afterwards (1706) he began to be much employed in promoting the union with Scotland. Not only did he write pamphlets as usual on the project, and vigorously recommend it in The Review, but in October 1706 he was sent on a political mission to Scotland by Sidney Godolphin, to whom Harley had recommended him. He resided in Edinburgh for nearly sixteen months, and his services to the government were repaid by a regular salary. He seems to have devoted himself to commercial and literary as well as to political matters, and prepared at this time a translation of History of the Union, which appeared in 1709.

In this year Henry Sacheverell delivered his famous sermons, and Defoe wrote several tracts about them and attacked the preacher in his Review.

In 1710 Harley returned to power, and Defoe was placed in a somewhat awkward position. To Harley himself he was bound by gratitude and by a substantial agreement in principle, but with the rest of the Tory ministry he had no sympathy. He seems, in fact, to have agreed with the foreign policy of the Tories and with the home policy of the Whigs, and naturally incurred the reproach of time-serving and the hearty abuse of both parties. At the end of 1710 he again visited Scotland. In the negotiations concerning the Peace of Utrecht, Defoe strongly supported the ministerial side, to the intense wrath of the Whigs, displayed in an attempted prosecution against some pamphlets of his on the all-important question of the succession. Again the influence of Harley saved him. He continued, however, to take the side of the dissenters in the questions affecting religious liberty, which played such a prominent part towards the close of Anne's reign. He naturally shared Harley's downfall; and, though the loss of his salary might seem a poor reward for his constant support of the Hanoverian claim, it was little more than his ambiguous, not to say trimmimg, position must have led him to expect.

Defoe declared that Lord Annesley was preparing the army in Ireland to join a Jacobite rebellion, and was indicted for libel; and prior to his trial (1715) he published an apology entitled An Appeal to Honour and Justice, in which he defended his political conduct. Having been convicted of the libel he was liberated later in the year under circumstances that only became clear in 1864, when six letters were discovered in the Record Office from Defoe to a Government official, Charles Delafaye, which, according to William Lee, established the fact that in 1718 at least Defoe was doing not only political work, but that it was of a somewhat equivocal kind—that he was, in fact, sub-editing the Jacobite Miss's Journal, under a secret agreement with the government that he should tone down the sentiments and omit objectionable items. He had, in fact, been released on condition of becoming a government agent. He seems to have performed the same not very honourable office in the case of two other journals—Dampier's Journal and the Mercurian Politicus—and to have written in these and other papers until nearly the end of his life. Before these letters were discovered it was supposed that Defoe's political work had ended in 1715.

Up to that time Defoe had written nothing but occasional literature, and, except the History of the Union and Jure Divino, nothing of any great length. In 1715 appeared the first volume of The Family Instructor, which was very popular during the 18th century. The first volume of his most famous work, the immortal story—partly adventure, partly moralizing—of The Life and Strange Surprising Adventures of Robinson Crusoe, was published on the 25th of April 1719. It ran through four editions in as many months, and then in August appeared the second volume. Twelve months afterwards the sequel Serious Reflections, now hardly ever reprinted, appeared. Its connexion with the two former parts is little more than nominal. Crusoe being simply made the mouth-piece of Defoe's sentiments on various points of morals and religion. Meanwhile the work had been reprinted as a feuilleton in Heathcote's Intelligencer, perhaps the earliest instance of the appearance of such a work in such a form. The story was founded on Dampier's Voyage round the World (1697), and still more on Alexander Selkirk's adventures, as communicated by Selkirk himself at a meeting with Defoe at the house of Mrs Damaris Daniel at Bristol. Selkirk afterwards told Mrs Daniel that he had handed over his papers to Defoe. Robinson Crusoe was immediately popular, and a wild story was set afoot of its having been written by Lord Oxford in the Tower. A curious idea, at one time revived by Henry Kingsley, is that the adventures of Robinson are allegorical and relate to Defoe's own life. This idea was certainly entertained to some extent at the time, and derives some colour of justification from words of Defoe's, but there seems to be no serious foundation for it. Robinson Crusoe (especially the story part, with the philosophical and religious moralizings largely cut out) is one of the world's classics in fiction. Crusoe's shipwreck and adventures, finding the footprint in the sand, his man "Friday"—the whole atmosphere of romance which surrounds the position of
the civilized man fending for himself on a desert island—these
have made Defoe's great work an imperishable part of English
literature. Contemporaneously appeared The Dumb Philosopher,
or Dickery Cronke, who gains the power of speech at the end of his
life and uses it to predict the course of European affairs.

In 1720 came The Life and Adventures of Mr. Duncan Campbell.
This was not entirely a work of imagination, its hero, the fortune-
teller, being a real person. There are amusing passages in the
story, but it is too desultory to rank with Defoe's best. In the
same year appeared two wholly or partially fictitious histories,
each of which might have made a reputation for any man. The
first was the Memoirs of a Cavalier, which Lord Chatham believed
was true history, and which William Lee considers the embody-
ment at least of authentic private memoirs. The Cavalier was
declared at the time to be Andrew Newport, made Lord Newport
in 1643. His elder brother was born in 1620 and the Cavalier
gives 1608 as the date of his birth, so that the facts do not fit the
dates. It is probable that Defoe, with his extensive acquaintance
with English history, and his astonishing power of working up
details, was fully equal to the task of inventing it. As a model
of historical work of a certain kind it is hardly surpassable, and
many separate passages—accounts of battles and skirmishes—
ever have been equalled except by Carlyle. Captain Singleton,
the last work of the year, has been unjustly depreciated by most of
the commentators. The record of the journey across Africa,
with its surprising anticipations of subsequent discoveries, yields
in interest to no work of the kind known to us; and the semi-
piratical Quaker who accompanies Singleton in his buccaneering
expeditions is a most likeable character. There is also a Quaker
who plays a very creditable part in Roxana (1724), and Defoe
seems to have been well affected to the Friends. In estimating
this wonderful productivity on the part of a man sixty years
old, it should be remembered that it was a habit of Defoe's to
keep his work in manuscript sometimes for long periods.

In 1721 were published three separate works. That next
year, and the twelfth year of Defoe's career, were his most
productive. There were The Fortunes and Misfortunes of Moll
Flanders, The Journal of the Plague Year, and The History of
Colonel Jack. Moll Flanders and The Fortunate Mistress (Roxana),
which followed in 1724, have subjects of a rather more than questionable character, but both display the remarkable art with which Defoe handles such subjects.

It is not true, as is sometimes said, that the difference
between the two is that between gross and polished vice.
The real difference is much more one of morals than of manners.
Moll is by no means of the lowest class. Notwithstanding the
greater degradation into which she falls, and her originally
dependent position, she has been well educated, and has con-
sorted with persons of gentle birth. She displays throughout
much greater real refinement of feeling than the more high-
flown Roxana, and is at any rate flesh and blood, if the flesh be
somewhat frail and the blood somewhat hot. Neither of the
heroines has any but the rudiments of a moral sense; but Roxana,
both in her original transgression and in her subsequent conduct,
is actuated merely by avarice and selfishness—which are
peculiarly offensive in connexion with her other failing, and
which make her thoroughly repulsive. The art of both stories
is great, and that of the episode of the daughter Susannah in
Roxana is consummate; but the transitions of the later plot
are less natural than those in Moll Flanders. It is only fair to
notice that while the latter, according to Defoe's more usual
practice, is allowed to repent and end happily, Roxana is brought
to complete misery; Defoe's morality, therefore, required more
repulsiveness in one case than in the other.

In the Journal of the Plague Year, more usually called, from
the title of the second edition, A History of the Plague, the accuracy
and apparent veracity of the details is so great that many
persons have taken it for an authentic record, while others have
contended for the existence of such a record as its basis. But
here too the genius of Mrs Veal's creator must, in the absence of
every evidence to the contrary, be allowed sufficient for the task.
The History of Colonel Jack is an unequal book. There is hardly
in Robinson Crusoe a scene equal, and there is consequently not

DEFOE

in English literature a scene superior, to that where the youthful
pickpocket first exercises his trade, and then for a time loses
his ill-gotten gains. But a great part of the book, especially
the latter portion, is dull; and in fact it may be generally remarked
of Defoe that the conclusions of his tales are not equal to the
beginning, perhaps from the restless indefatigability with which
he undertook one work almost before finishing another.

To this period belong his stories of famous criminals, of Jack
Sheppard (1724), of Jonathan Wild (1725), of the Highland Rogue
I.e. Rob Roy (1723). The pamphlet on the first of these Defoe
maintained to be a transcript of a paper which he persuaded
Sheppard to give to a friend at his execution.

In 1724 appeared also the first volume of A Tour through the
whole Island of Great Britain, which was completed in the two
following years. Much of the information in this was derived
from personal experience, for Defoe claims to have made many more
tours and visits about England than those of which we have
record; but the major part must necessarily have been dexterous
compilation. In 1724 appeared A New Voyage round the World,
apparently entirely due to the author's own fertile imagination
and extensive reading. It is full of his peculiar verisimilitude
and has all the interest of Anson's or Dampier's voyages, with
a charm of style superior even to that of the latter.

In 1726 Defoe published a curious and amusing little pamphlet
entitled Everybody's Business is Nobody's Business, or Private
Abuses Public Grievances, exemplified in the Pride, Insolence,
and Exorbitant Wages of our Women-Servants, Footmen, &c. This
subject was a favourite one with him, and in the pamphlet he
showed the immaturity of his political views by advocating
legislative interference in these matters. Towards the end of
this same year The Complete English Tradesman, which may be
supposed to sum up the experience of his business life, appeared,
and its second volume followed two years afterwards. This
book has been variously judged. It is generally and traditionally
read with more disposed to agree with Charles Lamb, who considered it "one of the nicest and dexterous
tendency," and thinks it "almost impossible to suppose
the author in earnest." The intolerable meanness advocated for
the sake of the paltriest gains, the entire ignoring of any pursuit
in life except money-getting, and the representation of the whole
duty of man as consisting first in the attainment of a fortunate
fortune, and next, when that fortune has been attained, in spending
not more than half of it, are certainly repulsive enough.

But there are no reasons for thinking the performance ironical or
insincere, and it cannot be doubted that Defoe would have been
honestly unable even to understand Lamb's indignation. To
1726 also belongs The Political History of the Devil. This is a
curious book, partly explanatory of Defoe's ideas on morality,
and partly belonging to a series of demonological works which he
wrote, and of which the chief others are A System of Magic (1726),
and An Essay on the History of Apparitions (1728), issued the
year before under another title. Of all these works his treat-
ment is on the whole rational and sensible; but in The History of
the Devil he is somewhat hampered by an insufficiently
worked-out theory as to the nature and personal existence of his
hero, and the manner in which he handles the subject is
an odd and not altogether satisfactory mixture of irony and
earnestness. A Plan of English Commerce, containing very
enlightened views on export trade, appeared in 1728.

During the years from 1715 to 1728 Defoe had issued pamphlets
and minor works too numerous to mention. The only one of
them perhaps which requires notice is Religious Courtship (1722),
a curious series of dialogues displaying Defoe's unaffected
religiosity, and at the same time the rather meddling intrusiveness
with which he applied his religious notions. This was
more flagrantly illustrated in one of his latest works, The Treaty
Concerning the Use and Abuse of the Marriage Bed (1727),
which was originally issued with a much more offensive name, and
has been called "an excellent book with an improper title." The
Memoirs of Captain Carleton (1728) were long attributed to Defoe,
but the internal evidence is strongly against his authorship.
They have been also attributed to Swift, with greater probability.
as far as style is concerned. *The Life of Mother Ross*, reprinted in Bohn's edition, has no claim whatever to be considered Defoe's.

There is little to be said of Defoe's private life during this period. He must in some way or other have obtained a considerable income. In 1724 he had built himself a large house at Stoke Newington, which had stables and grounds of considerable size. From the negotiations for the marriage of his daughter Sophia it appears that he had landed property in more than one place, and he had obtained on lease in 1722 a considerable estate from the corporation of Colchester, which was settled on his unmarried daughter at his death. Other property was similarly allotted to his widow and remaining children, though some difficulty seems to have arisen from the misconduct of his son, to whom, for some purpose, the property was assigned during his father's lifetime, and who refused to pay what was due. There is a good deal of mystery about the end of Defoe's life; it used to be said that he died insolvent, and that he had been in jail shortly before his death. As a matter of fact, after great suffering from gout and stone, he died in Ropemaker's Alley, Moorfields, on Monday the 26th of April 1731, and was buried in Bunhill Fields. He left no will, all his property having been previously assigned, and letters of administration were taken out by a creditor. How his affairs fell into this condition, why he did not die in his own house, and why in the previous summer he had been in hiding, as we know he was from a letter still extant, are points not clearly explained. He was, however, attacked by Mist, whom he wounded, in prison in 1724. It is most likely that Mist had found out that Defoe was a government agent and quite probable that he communicated his knowledge to other editors, for Defoe's journalistic employment almost ceased about this time, and he began to write anonymously, or as "Andrew Moreton." It is possible that he had to go into hiding to avoid the danger of being accused as a real Jacobite, when those with whom he hadcontracted to assume his character were dead and could no longer justify his attitude.

Defoe married, on New Year's Day, 1684, Mary Tuftey, who survived until December 1732. They had seven children. His second son, Bernard or Benjamin Norton, has, like his father, a scandalous niche in the *Dunciad*. In April 1787 public attention was called to the distress of three maiden ladies, directly descended from Defoe, and bearing his name; and a crown pension of £75 a year was bestowed on each of them. His youngest daughter, Sophia, who married Henry Baker, left a considerable correspondence, now in the hands of her descendants. There are several portraits of Defoe, the principal one being engraved by Vander- gucht.

In his lifetime, Defoe, as not belonging to either of the great parties at a time of the bitterest party strife, was subjected to obloquy on both sides. The great Whig writers leave him unnoticed. Swift and Gay speak slightly of him,—the former, it is true, at a time when he was only known as a party pamphleteer. Pope, with less excuse, put him in the *Dunciad* towards the end of his life, but he confessed to Spence in private that Defoe had written many things and none bad. At a later period he was unjustly described as "a scurrilous party writer," which he certainly was not; but, on the other hand, Johnson spoke of his writing "so variously and so well," and put *Robinson Crusoe* among the only three books that readers wish longer. From Sir Walter Scott downwards the tendency to judge literary work on its own merits to a great extent restored Defoe to his proper place, or, to speak more correctly, set him there for the first time. Lord Macaulay's description of *Roxana*, *Moll Flanders* and *Colonel Jack* as "utterly nauseous and wretched" must be set aside as a freak of criticism.

Scott justly observed that Defoe's style "is the last which should be attempted by a writer of inferior genius; for though it be possible to disguise mediocrity by fine writing, it appears in all its naked inanity when it assumes the garb of simplicity." The methods by which Defoe attains his result are not difficult to disengage. They are the presentation of all his ideas and scenes in the plainest and most direct language, the frequent employ-
wrong, wicked and shocking. His works of this class therefore are now the least valuable, though not the least curious, of his books.

The earliest regular life and estimate of Defoe is that of Dr Towers in the Bibliotheca Britannica. George Chalmers's Life, however, (1786), added very considerable information. In 1830 Walter Wilson wrote the standard Life (3 vols.); it is coloured by political prejudice, but is a model of painstaking care, and by its abundant citations of the opinions of others, which is largely inaccessible to the general reader, is invaluable. In 1859 a Life of Defoe by William Chadwick, an extraordinary rhapsody in which is half Cobbett and half Carlyle, but amusing, and but menial, in its whole mass, was published. In 1868 a second volume of this work appeared. His letter was printed by William Lee to a new investigation, and the results of this were published (London, 1869) in three large volumes. The first of these (well illustrated) contains a new life and particulars of the author's discoveries in the field of true history, and is followed by an exhaustive bibliography as assigned by Lee to Defoe for the first time.

For most of these, however, we have no authority but Lee's own impressions of style, and; and consequently, though the best qualified judges will in most cases agree that Defoe may have written them, it cannot positively be stated that he did. There is also a Life by Thomas Wright (1894). The Earlier Life and Chief Earlier Works of Defoe (1896) was included by Henry Morley in the " Carisbrooke Library." Charles Lamb's criticisms were, however, the peculiary feature of the work, which we refer to Wilson's book, and the third for The Reflector. The volume on Defoe (1789) in the " English Men of Letters " series is by W. Minto. There is considerable uncertainty about many of Defoe's writings; and even if they had been written, it is improbable that he would have compiled them in the order of his own acquaintance. Besides the list in Bown's Lowndes, which is somewhat of an omnium gatherum, three lists drawn with more or less care were compiled in the 19th century. Wilson's contains 210 distinct works, three or four of which are doubtful, in 12 volumes of the "English Men of Letters," and the third for The Reflector. The Serious Reflections now hardly ever published with Robinson Crusoe), Jare Divino, The Use and Abuse of Marriage, and many of the more important tracts and smaller works. There is also an edition, often called the "Defoe in English," edited by G. C. Lewis (London, 1840-1854). This contains the Complete Traders, Religious Courtship, The Consolator and other works not comprised in Hazlitt's. Scott had previously in 1809 edited for Bohn's Museum the English, and in the "Bohn's English Classics," includes the novels (except the third part of Robinson Crusoe), The History of the Devil, The Storm, and a few political pamphlets, also the undoubtedly spurious Mrs Ross. In 1870 Nullo of Edinburgh published two unissued volumes, from the papers of Chalmers's Life, annotated and completed by Wilson and Lee, Robinson Crusoe, pts. i. and ii., Colonel Jack, The Cavalier, Duncan Campbell, The Plague, Everybody's Business, Mrs Veal, The Shortest Way with Thieves, and Miscellaneous Writings (London, 1870). The Complete English Traders, an edition of Defoe's Romances and Narratives in sixteen volumes by G. A. Aitken came out in 1895.

If we turn to separate works, the bibliography of Defoe is practically confined (except as far as original editions are concerned) to Robinson Crusoe. Mrs Veal has been to some extent popularized by the work which it helped to sell; Religious Courtship and The Family Instrutor had a vogue among the middle class until well into the 10th century, and The History of the Universe was republished in 1786. But the reprints and editions of Crusoe have been innumerable; it has been often translated; and the eulogy pronounced on it by Rousseau美景, and current circulation, where imitations (or rather adaptations) have also been common.

In addition to the principal authorities already mentioned see John Forster, Historical and Biographical Essays (1858); G. Saintsbury, Introduction to Defoe's Works; and valuable articles by G. A. Aitken in The Contemporary Review (February, 1890), and The Athenaeum (April 30, 1899; August 31, 1890). A facsimile reprint (1883) of Robinson Crusoe has an introduction by Mr Austin Dobson. Dr Karl T. Bühler's biography of Defoe (1903) (London, 1885) and of Royal Education (London, 1905), from British Museum Add. MS. 32,555. Further light was thrown on Defoe's work as a political agent by the discovery (1866) of an unpublished paper of his to the British Museum Library, and printed in the English Historical Review, and afterwards separately.

DEGAS, HILAIRE GERMAN EDGARD (1834— ), French painter, was born in Paris on the 19th of July 1834. Entering in 1855 the École des Beaux Arts, he early developed independece of artistic outlook, studying under Lamothe. He first exhibited in the Salon of 1855, contributing a "War in the middle ages," a work executed in pastel. To this medium he was later faithful, using it for some of his best work. In 1866 his "Steepchase" revealed him as a painter of the racecourse and of all the most modern aspects of life and of Parisian society, treated in an extremely original manner. He subsequently exhibited in 1867 "Family Portraits," and in 1868 a portrait of a dancer in the "Ballet of La Source." In 1869 and 1870 he restricted himself to portraits; but thenceforward he abandoned the Salons and attached himself to the Impressionists. With Manet and Monet he took the lead of the new school at its first exhibition in 1874, and repeatedly contributed to these exhibitions (in 1876, 1878, 1879 and 1880). In 1886 he had shown his first study of a dancer, and in numerous pastels he proclaimed himself the painter of the ballet, representing its figurantes in every attitude with more constant aim at truth than grace. Several of his works may be seen at the Luxembourg Gallery, to which they were bequeathed, among a collection of impressionist pictures, by M. Caillebotte. In 1880 Degas showed his powers of observation in a set of "Portraits of Criminal," and he attempted modelling in a "Dancing," in wax. He afterwards returned to his studies of the sporting world, exhibiting in December 1884 at the Petit Gallery two views of "Races" which had a great success, proving the increasing vogue of the artist among collectors. He had exhibited with the " Impressionist school." At the eighth Impressionist Exhibition, in 1886, Degas continued his realistic studies of modern life, showing drawings of the nude, of workmen, and of jockeys. Besides his pastels and his paintings of genre and portraits—among these, several likenesses of Manet—Degas also handled his favourite subjects in etching and in aquatint; and executed several lithographs of " Singers at Cafés-concert," of "Ballet-girls," and indeed of every possible subject of night-life and incidents behind the scenes. His work is to be seen not only at the Luxembourg but in many of the great private collections in Paris, in England and America. In the Centenary Exhibition of 1900 he exhibited "The Interior of a Cotton-Broker's Office at New Orleans" (belonging to the Museum at Pa) and "The Rehearsal." See also G. Moore, "Degas, the Painter of Modern Life," Magazine of Art (1890); J. K. Huysmans, Cézanne (Paris, 1889); Geoffroy, La Vérité Artistique (3e Série, Paris, 1894).

DE GEER, LOUIS GERHARD, BARON (1818—1896), Swedish statesman and writer, was born on the 18th of July 1818 at Pinspång castle. He adopted the legal profession, and in 1855 became president of the Götia Hofret, or lord justice of one of the Swedish supreme courts. From the 7th of April 1858 to the 3rd of June 1870 he was minister of justice. As a member of the Upper House he took part in all the Swedish Riksdags from 1851 onwards, though he seldom spoke. From 1867 to 1878 he was the member for Stockholm in the first chamber, and introduced and passed many useful reformatory statutes; but his greatest achievement, as a statesman, was the reform of the Swedish representative system, whereby he substituted a bi-cameral elective parliament, on modern lines, for the existing cumbersome representation by estates, a survival from the later middle ages. This great measure was accepted by the Riksdag in December 1865, and received the royal sanction on the 22nd of June 1866. For some time after this De Geer was the most popular man in Sweden. He retired from the ministry in 1870, but took office again, as minister of justice, in 1875. In 1876 he became minister of state, which position he retained till April 1880, when the failure of his repeated efforts to settle the armaments' question again induced him to resign. From 1881 to 1883 he was chancellor of the universities of Upsala and Lund. Besides several novels and aesthetic essays, De Geer has written a few political memoirs of supreme merit both as to style and matter, the most notable of which are: Minnebokning öfver A. J. a. Høphen (Stockholm, 1881); Minnebokning öfver Hans Järta (Stockholm, 1874); Minnebokning öfver B. B. von Platen (Stockholm, 1886); and his own Minnen (Stockholm, 1892), an autobiography, invaluable as a historical document, in which the political experience and the matured judgments of
DEGGENDORF

DEGGENDORF, or DECKENDORF, a town of Germany, in the kingdom of Bavaria, 25 m. N.W. of Passau, on the left bank of the Danube, which is there crossed by two iron bridges. Pop. (1805) 7154. It is situated at the lower end of the beautiful valley of the Perlach, and in itself it is a well-built and attractive town. It possesses an old town hall dating from 1566, a hospital, a lunatic asylum, an orphanage, and a large parish church rebuilt in 1750; but the chief interest centres in the church of the Holy Sepulchre, built in 1337, which attracts thousands of pilgrims to its Porta Coeli or Gnadenpforte (Gate of Mercy) opened annually on Michaelmas eve and closed again on the 4th of October. In 1837, on the celebration of the 500th anniversary of this solemnity, the number of pilgrims was reckoned at nearly 100,000. Such importance as the town possesses is now rather commercial than religious,—it being a depot for the timber trade of the Bavarian forest, a station for the Danube steamboat company, and the seat of several mills, breweries, potteries and other industrial establishments. On the bank of the Danube outside the town are the remains of the castle of Findelstein; and on the Geiersberg (1243 ft.), in the immediate vicinity, stands another old pilgrimage church. About 6 m. to the north is the village of Metten, with a Benedictine monastery founded by Charlemagne in 801, restored as an abbey in 1830 by Louis I. of Bavaria, and well known as an educational institution. The first mention of Deggendorf occurs in 868, and it appears as a town in 1212. Henry (d. 1200) of the Landshut branch of the ruling family of Bavaria made it the seat of a custom-house; and in 1331 it became the residence of Henry III. of Natternberg (d. 1333), so called from a castle in the neighbourhood. In 1337 a wholesale massacre of the Jews, who were accused of having thrown the sacred host of the church of the Holy Sepulchre into a well, took place in the town; and it is probably from about this date that the pilgrimage above mentioned came into vogue. The town was captured by the Swedish forces in 1633, and in the war of the Austrian Succession it was more than once laid in ashes.

See Gruber and Möller. Der bayerische Wald (Regensburg, 1851); Mittermüller, Die heil. Hostien und die Jüden in Deggendorf (Landshut, 1886); and Das Kloster Metten (Straubing, 1857).

DE HAAS, MAURITZ FREDERICK HENDRICK (1832-1895), American marine painter, was born on the 12th of December 1832 in Rotterdam, Holland. He studied art in the Rotterdam Academy and at The Hague, under Bosboom and Louis Meyer, and in 1851-1852 in London, following the English water-colourists of the day. In 1857 he received an artist's commission in the Dutch navy, but in 1859, under the patronage of August Belmont, who had recently been minister of the United States at The Hague, he resigned and removed to New York city. He became an associate of the National Academy in 1863 and an academician in 1867, and exhibited annually in the academy, and in 1866 he was one of the founders of the American Society of Painters in Water Colors. He died on the 23rd of November 1895. His "Farragut Passing the Ports at the Battle of New Orleans" and "The Rapids above Niagara," which were exhibited at the Paris Exposition of 1858, were his best known works, and his most typical works, for his later subjects were storm and wreck, wind and heavy surf, and less often moonlight, on the coasts of Holland, of Jersey, of New England, and of Long Island, and on the English Channel.

His brother, WILLIAM FREDERICK DE HAAS (1830-1880), who emigrated to New York in 1854, was also a marine painter.

DEHRA, a town of British India, headquarters of the Dehra Dun district in the United Provinces. Pop. (1901) 28,409. It lies at an elevation of 2300 ft. Here the Hardwar-Dehra railway terminates. Dehra is the headquarters of the Trigonometrical Survey and of the Forest Department, besides being a cantonment for a Gurkha force. The Forest School, which trains subordinate forest officials for all parts of India, is a fine building. Attached to it is an institution for the scientific study of sylviculture and the exploitation and administration of forests. The town of Dehra grew up round the temple built in 1669 by the heretical Sikh Guru, Ram Rai, the founder of the Udasi sect of Ascetics. This temple is a remarkable building in Mahomedan style. The central block, in imitation of the emperor Jahangir's tomb, contains the bed on which the Guru, after dying at will and coming back to life several times, ultimately died outright; it is an object of great veneration. At the corners of the central block are smaller monuments commemorating the Guru's wives.

DEHRA DUN, a district of British India, in the Meerut division of the United Provinces. Its area is 1209 sq. m. The district is bounded on the N. by the native state of Tehri-Garhwal, on the E. by British Garhwal, on the S. by the Siwalik hills, which separate it from Saharanpur district, and on the W. by the hill states of Sirmur, Jubbal and Taroch. The valley (the Dun) has an area of about 673 sq. m., and forms a parallelogram 45 m. from N.W. to S.E. and 15 m. broad. It is well wooded, undulating and intersected by streams. On the N.E. the horizon is bounded by the Mussoorie or lower range of the Himalayas, and on the S. by the Siwalik hills. The Himalayas in the north of the district attain a height between 7000 and 8000 ft. One peak, known as Chaukundi (1595 ft.), the highest point of the Siwalik range is 9441 ft. above sea-level. The principal passes through the Siwalik hills are the Timli pass, leading to the military station of Chakrata, and the Mohand pass leading to the sanatoriums of Mussoorie and Landour. The Ganges bounds the Dehra valley on the E.; the Jumna bounds it on the W. From a point about midway between the two rivers, and near the town of Dehra, runs a ridge which forms the watershed of the valley. To the west of this ridge the water collects to form the Asan, a tributary of the Jumna; whilst to the east the Suswa receives the drainage and flows into the Ganges. To the east the valley is characterized by swamps and forests, but to the west the natural depressions freely carry off the surface drainage. Along the central ridge, the water-level lies at a great depth from the surface (228 ft.), but it rises gradually as the country declines towards the great rivers. In 1901 the population was 178,195, showing an increase of 6 % in the decade. A railway to Dehra from Hardwar, on the Oudh and Rohilkund line (32 m.), was completed in 1900. The district is served by the Dun canals. Tea gardens cover a considerable area, and the valley contains a colony of European tea planters.

History.—Dehra Dun only emerges from the mists of legend into authentic history in the 17th century A.D., when it formed part of the Garhwal kingdom. Towards the end of the century the heretical Sikh Guru, Ram Rai, expelled from the Punjab, sought refuge in the Dun and gathered round him a crowd of devotees. Fateh Sah, raja of Garhwal, endowed the temple which he built, round which grew up the town of Gurudwara or Dehra (q.v.). In the 18th century the fertility of the valley attracted the attention of Najib-ud-daula, governor of Saharanpur, who invaded it with an army of Rohillas in 1775 and annexed it to his dominion. His rule, which lasted till 1770, brought great prosperity to the Dun; but on his death it became a prey to the surrounding tribes, its desolation being completed after its conquest by the Gurkas in 1857. In 1841 it was taken possession of by the British, and in the following year was annexed to Saharanpur. Under British administration the Dun rapidly recovered its prosperity.

DEIOCES (Δειοκτητία), according to Herodotus (i. 66 ff.) the first king of the Medes. He narrates that, when the Medes had rebelled against the Assyrians and gained their independence about 710 B.C., according to his chronology (cf. Diodor. ii. 32), they lived in villages without any political organization, and therefore the whole country was in a state of anarchy. Then Deioes, son of Phraortes, an illustrious man of upright character, was chosen judge in his village, and the justness of his decisions induced the inhabitants of the other villages to throng to him. At last the Medes resolved to make an end of the intolerable state of their country by erecting a kingdom, and chose Deioes king. He now caused them to build a great capital, Ecbatana, with a royal palace, and introduced the ceremonial of oriental courts;
he surrounded himself with a guard and no longer showed himself to the people, but gave his judgments in writing and controlled the people by officials and spies. He united all the Median tribes, and ruled fifty-three years (c. 699–647 B.C.), though perhaps, as G. Rawlinson supposed, the fifty-three years of his reign are exchanged by mistake with the twenty-two years of his son Phraortes, under whom the Median conquests began.

The narration of Herodotus is only a popular tradition which derives the fall of the Median kingdom from his judicial functions, considered as its principal and most beneficent subject. We know from the Assyrian inscriptions that just at the time which Herodotus assigns to Deioces the Medes were divided into numerous small principalities and subjected to the great Assyrian conquerors. Among these petty chieftains, Sargon in 715 mentions Dāyukku, “lieutenant of Man” (he probably was, therefore, a vassal of the neighboring king of Man in the mountains of south-eastern Armenia), who joined the Urartians and other enemies of Assyria, but was sargon transported to Hamath in Syria “with his clan.” His district is called “bit-Dāyukki,” “house of Deioces,” also in 715, when Sargon invaded these regions again. So it seems that the dynasty, which more than half a century later succeeded in throwing off the Assyrian yoke and founded the Median empire, was derived from this Dāyukku, and that his name was thus introduced into the Median traditions, which contrary to history considered him as founder of the kingdom. (Ep. M.)

DEIÔTARUS, a tetarch of Galatia (Gallo-Graecia) in Asia Minor, and a faithful ally of the Romans. He is first heard of at the beginning of the third Mithradatic war, when he drove out the troops of Mithradates under Eumachus from Phrygia. His most influential friend was Pompey, who, when settling the affairs of Asia (63 or 62 B.C.), rewarded him with the title of king and an increase of territory (Lesser Armenia). On the outbreak of the civil war, Deiotarus naturally sided with his old patron Pompey, and after the battle of Pharsalus escaped with him to Asia. In the meantime Pharmaces, the son of Mithradates, had seized Lesser Armenia, and defeated Deiotarus near Nicopolis. Fortunately for Deiotarus, Caesar at that time (47) arrived in Asia from Egypt, and was met by the tetarch in the dress of a supplant. Caesar pardoned him for having sided with Pompey, ordered him to resume his royal attire, and hastened against Pharmaces, whom he defeated at Zela. In consequence of the complaints of certain Galatian princes, Deiotarus was deprived of part of his dominions, but allowed to retain the title of king. On the death of Mithradates of Pergamum, tetarch of the Trocmi, Deiotarus was a candidate for the vacancy. Other tetrarchs also pressed their claims; and, further, Deiotarus was accused by his grandson Castor of having attempted to assassinate Caesar when the latter was his guest in Galatia. Cicero, who entered a high opinion of Deiotarus, whose acquaintance he had made when governor of Cilicia, undertook his defence, the case being heard in Caesar’s own house at Rome. The matter was allowed to drop for a time, and the assassination of Caesar prevented any final decision being pronounced. In his speech Cicero briefly dismisses the charge of assassination, the main question being the distribution of the provinces, which was the real cause of the feud between Deiotarus and his relatives.

After Caesar’s death, Mark Antony, for a large monetary consideration, publicly announced that, in accordance with instructions left by Caesar, Deiotarus was to resume possession of all the territory of which he had been deprived. When civil war again broke out, Deiotarus was persuaded to support Brutus and Cassius, but after the battle of Philippi went over to the triumvirs. He remained in possession of his kingdom till his death at a very advanced age.

See Cicero, Philippica, ii. 37; Ad fam. viii. 10, ix. 12, xv. 1, 2, 4; Ad Att. xiv. 1; De divin. i. 15, ii. 36, 37; De harusp. resp. 13, and above all Pro rege Deiotaro, Appian; Bell. Mithridat. 75. 114; Bell. Alexandrinum. 34. 41, 65. 77; Dio Cassius xi. 63, xii. 45. xvii. 24, 48, xviii. 33.

DEIR, or Deir ez-Zor, a town of Asiatic Turkey, on the right bank of the Euphrates, 27½ m. above its junction with the Khabur, lat. 35° 20’ N., long. 40° 32’ E. Pop. 8000 and upward, about one-twelfth Christians; except in the official classes, there are no Turks. It is the capital and the only considerable town of the Zor sanjak, formed in 1857, which includes Ras el-Ain on the north and Palmyra on the south, with a total area of 32,800 sq. m., chiefly desert, and an estimated population of 100,000, mostly Arab nomads. Deir itself is a thrifty and rising town, having a fair bazaar; it is singularly European in appearance, with macadamized streets and a public garden. The name Deir means monastery, but there is no other trace or tradition of the occupation of the site before the 14th century, and until it became the capital of the sanjak it was an insignificant village. It is an important centre for the control of the Bedouin Arabs, and has a garrison of about 1000 troops, including a special corps of mule-riders. It is also a road centre, the roads from the Mediterranean to Bagdad by way of Aleppo and Damascus respectively meeting here. A road also leads northward, by Sinjar, to Mosul, crossing the river on a stone bridge, built in 1897, the only permanent bridge over the Euphrates south of Asia Minor.

(J. P. Pe.)

DEIÆA, the southern of the two English kingdoms afterwards united as Northumbria. According to Simeon of Durham it extended from the Humber to the Tyne, but the land was wasted by the Teuton conquerors. York was the capital of its kings at the date of its first settlement is quite unknown, but the first king of whom we have any record is Ella or Alfa, the father of Edwin, who is said to have been reigning about 585. After his death Deira was subject to Eðelthirft, king of Northumbria, until the accession of Edwin, in 616 or 617, who ruled both kingdoms (see Edwin) till 633. Osric the nephew of Edwin ruled Deira (633–654), but his son Oswine was put to death by Oswio in 651. For a few years subsequently Deira was governed by Æthelwald son of Oswald.

DEISM (Lat. deus, god), strictly the belief in one supreme God. It is however the received name for a current of rationalistic theological thought which, though not confined to one country, or to any well-defined period, was most conspicuous in England in the last years of the 17th and the first half of the 18th century. The deists, differing widely in important matters of belief, were yet agreed in seeking above all to establish the certainty and sufficiency of natural religion in opposition to the positive religions, and in tacitly or expressly denying the unique significance of the supernatural revelation in the Old and New Testaments. They either ignored the Scriptures, endeavoured to prove them in the main by a helpful republication of the Evangelium aeternum, or directly impugned their divine character, their infallibility, and the validity of their evidences as a complete manifestation of the will of God. The term "deism" not only is used to signify the main body of the deists’ teaching, or the tendency they represent, but has come into use as a technical term for one specific metaphysical doctrine as to the nature of God, and to this it has been characteristic of the deists, and to have distinguished them from pantheists and theists,—the belief, namely, that the first cause of the universe is a personal God, who is, however, not only distinct from the world but apart from it and its concerns.

The words “deism” and “deist” appear first about the middle of the 17th century in France (cf. Bayle’s Dictionnaire, s.v. “Viret,” note D), though the deistic standpoint had already been foreshadowed to some extent by Averroists, by Italian authors like Boccaccio and Petrarch, in More’s Utopia (1515), and by French writers like Montaigne, Charron and Bodin. The first specific attack on deism in English was Bishop Stillingfleet’s Letter to a Deist (1677). By the majority of those historically known as the English deists, from Blunt onwards, the name was owned and honoured. They were also occasionally called “rationalists.” “Free-thinker” (in Germany, Freidenker) was generally taken to be synonymous with “deist,” though obviously
DEISM

capable of a wider significance, and as coincident with 
spirit fori and de libertin in the original and theological sense of the word:1

"Naturalists" were women frequently used of such as recognized 
no god but nature, of so-called Spinozists, atheists; but both in 
England and Germany, in the 18th century, the word was more 
commonly and aptly in use for those who founded their religion 
on the lumen naturae alone. It was evidently in common use 
in the latter half of the 16th century as it is used in De Moray in 
De la vérieté de la religion chrétienne (1581) and by Montaigne.
The same men were not seldom assaulted under the name of 
"theists"; the last distinction between 
"theist" and 
"deist," which stamped the latter word as excluding the belief in providence 
or the immorality of God, was apparently formulated in 
the end of the 18th century by those rationalists who were 
agrieved at being identified with the naturalists. (See also 
THEISM.)

The chief names amongst the deists are those of Lord Herbert of 
Cherbury (1583–1648), Charles Blount (1654–1693), Matthew 
Tindal (1657–1733), William Wollaston (1659–1724), Thomas 
Woolston (1669–1733), Janus Junius (commonly known as John) 
Toland (1670–1722), the 3rd Earl of Shaftesbury (1671–1713), 
Viscount Bolingbroke (1678–1751), Anthony Collins (1676–1729), 
Thomas Morgan (1743), and Thomas Chubb (1759–1747).2

Prideaux, Viscount Woolston, and Henry "Doddwell (the 
d. 1784), who made his contribution to the controversy 
in 1742, are of less importance. Of the eleven first named, 
ten appear to have been born within twenty-five years of one 
another; and it is noteworthy that by far the greater part of 
the literary activity of the deists, as well as of their voluminous 
works, falls within the same half century.

The impulses that promoted a vein of thought cognate to 
deism were active both before and after the time of its 
greatest notoriety. But there are many reasons to show why, in 
the 17th century, men should have set themselves with a new zeal, in 
politics, law and theology, to follow the light of nature alone, and 
to cast aside the fetters of tradition and prescriptive right, of 
positive codes, and scholastic systems, and why in England 
especially there should, amongst numerous free-thinkers, have been 
not a few free writers. The significance of the Copernican 
system, as the total overthrow of the traditional conception of 
the universe, dawned on all educated men. In physics, Descartes 
had prepared the way for the final triumph of the mechanical 
explanation of the world, and Newton's system, in England the 
new cosmology had broken with time-honoured beliefs more 
completely than it had done even in France; Hobbes was more 
sarcastic than Bacon; Locke's philosophy, as well as his theology, 
served as a school for the deists. Men had become weary of 
Protestant scholasticism; religious wars had made peaceful 
thinkers seek to take the edge off dogmatical rancour; and the 
multiplicity of religious sects, coupled with the complete failure 
of various attempts at any substantial reconciliation, provoked 
distrust of the common basis on which all were founded. There was 
a school of distinctively latitudinarian thought in the Church of 
England; others not unnaturally thought it better to extend the 
realm of the adiaphora beyond the sphere of Protestant ritual or 
the details of systematic divinity. Arminianism had revived the 
radical side of theological method. Semi-Arians and Unitarians, 
though sufficiently distinguished from the free-thinkers by reverence 
for the letter of Scripture, might be held to encourage 
departure from the ancient landmarks. The scholarly labours 
of P. D. Huet, R. Simon, L. E. Dupin, and Jean Le Clerc (Clericus), 
of the orientalists John Lightfoot, John Spencer and Humphrey 
Frideaux, of John Mill, the collector of New Testament readings, 
and John Fell, furnished new materials for controversy; and the 

1 The right of the orthodox party to use this name was asserted by the publication in 1715 of a journal called The Free-thinker, 

conducted by anti-deistic clergymen. The term libertin appears to have been used first as a hostile epithet of the Brethren of the 

Free Spirit, a 13th-century sect which was accused not only of free-thought but also of licentious living.

2 See the separate biographies of these writers. The three most 

significant names after Lord Herbert are those of Toland, Wollaston 

and Tindal.
DEISM

for which they wrought. Founding ethics on the native and culturable capacities in men to appreciate worth in men and actions, and, like the ancient Greek thinkers whom he followed, associating the apprehension of morality with the apprehension of beauty, he makes morality wholly independent of scriptural enactment, and still more, of theological forecasting of future bliss or agony. He yet insisted on religion as the crown of virtue; and, arguing that religion is inseparable from a high and holy enthusiasm for the divine plan of the universe, he sought the root of religion in feeling, not in accurate beliefs or meritorious good works. He set little store on the theology of those who in a system of dry and barren notions “pay handsome compliments to the Deity,” “remove providence,” “explode devote,” and leave but “little of zeal, affection, or warmth in what they call rational religion.”

In the protest against the scheme of “judging truth by counting noses,” Shaftesbury recognized the danger of the standard which seemed to satisfy many deists; and in almost every respect he has more in common with those who afterwards, in Germany, annihilated the pretensions of complacent rationalism than with the rationalists themselves.

Toland, writing at full length without hostility to any of the parts of the Christian faith, insisted that Christianity was not mysterious, and that the value of religion could not lie in any unintelligible or self-contradictory elements; though we cannot know the real essence of God or of any of his creatures, yet our beliefs about God must be thoroughly consistent with reason. Afterwards, Toland discussed, with considerable real learning and much show of candour, the comparative evidence for the canonical and apocryphal Scriptures, and demanded a careful and complete historical examination of the grounds on which our acceptance of the New Testament can rest. He contributed little to the solution of the problem, but forced the instruction of the canon alike on theologians and the reading public. Again, he sketched a view of early church history, further worked out by Johann Salomo Semler (1725-1791), and surprisingly like that which was later elaborated by the Tübingen school. He tried to show, both from Scripture and extra-canonical literature, that the primitive church, so far from being an incorporeal body of believers with the same creed and customs, really consisted of two schools, each possessing its “own gospel”—a school of Elisionists or Judaizing Christians, and the more liberal school of Paul. These parties, consciously but amicably differing in their whole relation to the Jewish law and the outside world, were subsequently forced into a non-natural uniformity. The cogency of Toland’s arguments was weakened by his manifest love of paradox. Wollaston upheld the “intellectual” theory of morality, and all his reasoning is independent of any authority or evidence derived from revelation. His system was simplicity itself, all sin being reduced to the one form of lying. He favoured the idea of a future life as being necessary to set right the mistakes and inequalities of the present.

Collins, who had created much excitement by his Discourse of Free-thinking, insisting on the value and necessity of unprejudiced inquiry, published at a later stage of the deistic controversy the famous argument on the evidences of Christianity. Christianity is founded on Judaism; its main prop is the argument from the fulfilment of prophecy. Yet we may interpret the arrangement of the text of Old Testament prophecies will secure a fair and non-allegorical correspondence between these and their alleged fulfilment in the New Testament. The inference is not expressly drawn, though it becomes perfectly clear from his refutation of William Whiston’s curious counter theory that there were in the original Hebrew scriptures prophecies which were literally fulfilled in the New Testament, but had been expunged at an early date by Jewish scribes. Collins indicates the possible extent to which the Jews may have been indebted to Chaldeans and Egyptians for their theological views, especially as great part of the Old Testament would appear to have been remodelled by Ezra; and, after dwelling on the points in which the prophecies attributed to Daniel differ from all other Old Testament predictions, he states the greater number of the arguments still used to show that the book of Daniel deals with events past and contemporaneous, and is from the pen of a writer of the Maccabean period, a view now generally accepted. Collins resembles Blount in “attacking specific Christian positions rather than seeking for a foundation on which to build the edifice of Natural Religion.” Amongst those who replied to him were Richard Bentley, Edward Chandler, bishop of Lichfield, and Thomas Sherlock, afterwards bishop of London, who also attacked Woolston. They refuted him easily on many specific points, but carefully abstained from discussing the real question at issue, namely the propriety of free inquiry.

Woolston, at first to all appearance working earnestly in behalf of an allegorical but believing interpretation of the New Testament miracles, ended by assaulting, with a yet unknown violence of speech, the absurdity of accepting them as actual historical events, and did his best to overthrow the credibility of Christ’s principal miracles. The bitterness of his outspoken invective against the clergy, against all priestcraft and priesthood, was a new feature in deistic literature, and injured the author more than it furthered his cause.

Morgan criticized with great freedom the moral character of the persons and events of Old Testament history, developing the theory of conscious “accommodation” on the part of the leaders of the Jewish church. This accommodation of truth, by altering the form and substance of it to meet the views and secure the favour of ignorant and bigoted contemporaries, Morgan attributes also to the apostles and to Jesus. He likewise expands at great length a theory of the origin of the Catholic Church much like that sketched by Toland, but assumes that Paul and his party, latterly at least, were distinctly hostile to the Judaical party of their fellow-believers in Jesus as the Messias, while the college of the original twelve apostles and their adherents viewed Paul and his followers with suspicion and disfavour. Persecution from without Morgan regards as the influence which mainly forced the antagonistic parties into the oneness of the catholic and orthodox church. Morgan “seems to have discerned the dawning of a truer and better method” than the others. “He saw dimly that things require to be accounted for as well as affirmed or denied,” and he was “one of the pioneers of modern historical science as applied to biblical criticism.”

Annet made it his special work to invalidate belief in the resurrection of Christ, and to discredit the work of Paul.

Chubb, the least learnedly educated of the deists, did more than any of them, save Hervey, to round his system into a logical whole. From the New Testament he sought to show that the teaching of Christ substantially coincides with natural reason as he understood it. But his main contention is that Christianity is not a doctrine but a life, not the reception of a system of truths or facts, but a pious effort to live in accordance with God’s will here, in the hope of joining him hereafter. Chubb dwells with special emphasis on the fact that Christ preached the gospel to the poor, and argues, as Tindal had done, that the gospel must therefore be accessible to all men without any need for learned study of evidences for miracles, and intelligible to the meanest capacity. He sought to show that even in the New Testament there are essential contradictions, and instances the unconditional forgiveness preached by Christ in the gospels as compared with Paul’s doctrine of forgiveness by the mediation of Christ. Externally Chubb is interesting as representing the desir of the people contrasted with that of Tindal the theologian.
DEISM

Dodwell's ingenious thesis, that Christianity is not founded on argument, was certainly not meant as an aid to faith; and, though its starting-point is different from all other deistical works, it may safely be reckoned amongst their number.

Though himself contemporary with the earlier deists, Bolingbroke's principal works were posthumously published after interest in the controversy had declined. His whole strain, in sharp contrast to that of most of his predecessors, is cynical and satirical, and suggests that most of the matters discussed were of small personal concern to himself. He gives fullest scope to the ungenerous view that a vast proportion of profoundly revealed truth was ingeniously palmed off by the more cunning on the more ignorant for the convenience of keeping the latter under. But he writes with keenness and wit, and knows well how to use the materials already often taken advantage of by earlier deists.

Before passing on to a summary of the deistic position, it is necessary to say something of the views of Conyers Middleton (c.e.), who, though he never actually severed himself from orthodoxy, yet advanced theories closely analogous to those of the deists. His most important theological work was that devoted to an exposure of parochial miracles. His attempt was based largely on arguments which could be turned with equal force against the miracles of the New Testament, and he even went further than previous rationalists in impugning the credibility of statements as to alleged miracles emanating from martyrs and the fathers of the early church. That Middleton was prepared to carry this type of argument into the apostolic period is shown by certain posthumous essays (Miscellaneous Works; ii. pp. 255 ff.), in which he charges the New Testament writers with inconsistency and the apostles with suppressing their cherished beliefs on occasions of difficulty.

In the substance of what they received as natural religion, the deists were for the most part agreed; Herbert's articles continued to contain the fundamentals of their theology. Religion, though not identified with morality, had its most important outcome in a faithful following of the eternal laws of morality, regarded as the will of God. With the virtuous life was further to be conjoined a humble disposition to adore the Creator, avoiding all factitious forms of worship as worse than useless. The small value they attributed to all outward and special forms of service, and the want of any sympathetic craving for the communion of saints, saved the deists from attempting to found a free-thinking church. They seem generally to have inclined to a quietistic accommodation to established forms of faith, till better times came. They steadfastly sought to eliminate the miraculous from theological belief, and to expel from the system of religious truth all debatable, difficult or mysterious articles. They aimed at a rational and intelligible faith, professedly in order to make religion, in all its width and depth, the heritage of every man. They regarded with as much suspicion the notion of a "peculiar people" of God, as of a unique revelation, and insisted on the possibility of salvation for the heathen. They rejected the doctrine of the Trinity, and protested against mediatorial, atonement and the imputed righteousness of Christ, always laying more stress on the teaching of Christ than on the teaching of the church about him; but they repeatedly laid claim to the name of Christians or of Christ's deists. Against superstition, fanaticism and priestcraft they protested unceasingly. They all recognized the soul of man—not regarded as intellectual alone—as the ultimate court of appeal. But they varied much in their attitude towards the Bible. Some were content to argue their own ideas into Scripture, and those they disliked out of it; to one or two it seemed a satisfaction to discover difficulties in Scripture, to point to historical inaccuracies and moral defects. Probably Chubb's position on this head is most fairly characteristic of deism. He holds that the narrative, especially of the New Testament, is in the main accurate, but, as written after the events narrated, has left room for misunderstandings and mistakes. The apostles were good men, to whom, after Christ, we are most indebted; but they were fairly entitled to their own private opinions, and naturally introduced these into their writings. The epistles, according to Chubb, contain errors of fact, false interpretations of the Old Testament, and sometimes disfigurement of religious truth.

The general tendency of the deistical writings is sufficiently self-consistent to justify a common name. But deism is not a compact system nor is it the outcome of any one line of philosophical thought. Of matters generally regarded as pertaining to natural religion, that on which they were least agreed was the certainty, philosophical demonstrability and moral significance of the immortality of the soul, so that the deists have sometimes been grouped into "mortal" and "immortal" deists. For some the belief in future rewards and punishments was an essential of religion; some seem to have questioned the doctrine as a whole; and, while others made it a basis of morality, Shaftesbury protested against the ordinary theological form of the belief as immoral. No two thinkers could well be more opposed than Shaftesbury and Hobbes; yet sometimes ideas from both were combined by the same writer. Collins was a pronounced necessitarian; Morgan regarded the denial of free will as tantamount to atheism. And nothing can be more misleading than to assume that the belief in a Creator, existent wholly apart from the working of the world, was characteristic of the deists as a body. In none of them is there any theory on the subject particularly prominent, except that in their denial of miracles, of supernatural revelation, and a special redemptive interposition of God in history, they seem to have thought of providence much as the mass of their opponents did. Herbert starts his chief theological work with the design of vindicating God's providence. Shaftesbury vigorously protests against the notion of a wholly transcendent God. Morgan more than once expresses a theory that would now be pronounced one of immanence. Toland, the inventor of the name of pantheism, was notoriously, for a great part of his life, in some sort a pantheist. And while as thinkers they diverged in their opinions, so too they differed radically in character, in reverence for their subject and in religious earnestness and moral worth.

The deists were not powerful writers; none of them was distinguished by wide and accurate scholarship; hardly any was either a deep or comprehensive thinker. But though they generally had the best scholarship of England against them, they were bold, acute, well-informed men; they appreciated more fully than their contemporaries not a few truths now all but universally accepted; and they seemed therefore entitled to leave their mark on subsequent theological thought. Yet while the seed they sowed was taking deep root in France and in Germany, the English deists, the most notable men of their time, were soon forgotten, or at least ceased to be a prominent factor in the intellectual life of the century. The controversies they had provoked collapsed, and deism became a by-word even amongst those who were in no degree anxious to appear as champions of orthodoxy.

The fault was not wholly in the subjectivism of the movement. But the subjectivism that founded its theology on the "common sense" of the individual was accompanied by a fatal pseudo-universalism which, cutting away all that was peculiar, individual and most intense in all religions, left in any one of them but a lifeless form. A theology consisting of a few vague generalizations was sufficient to sustain the piety of the best of the deists; but it had not the concreteness or intensity necessary to take a firm hold on those whom it emancipated from the old beliefs. The negative side of deism came to the front, and, communicated with fatal facility, seems ultimately to have constituted the deism that was commonly professed at the clubs of the wits and the tea-tables of polite society. But the intenser religious life before which deism fell was also a revolt against the abstract and argumentative orthodoxy of the time.

That the deists appreciated fully the scope of difficulties in Christian theology and the sacred books is not their most noteworthy feature; but that they made a stand, sometimes cautiously, often with outspoken fearlessness, against the presupposition that the Bible is the religion of Protestants. They themselves gave way to another presupposition equally fatal to true historical research, though in great measure common to them and their opponents. It was assumed by deists in
debating against the orthodox, that the flood of error in the hostile camp was due to the benevolent cunning or deliberate self-seeking of unscrupulous men, supported by the ignorant with the obstinacy of prejudice.

Yet deism deserves to be remembered as a strenuous protest against bibliolatry in every degree and against all traditionalism in theology. It sought to look not a few facts full in the face, from a new point of view and with a thoroughly modern though unhistorical spirit. It was not a religious movement; and though, as a defiance of the accepted theology, its character was mainly theological, the deistical crusade belongs, not to the history of the church, or of dogma, but to the history of general culture. It was an attitude of mind, not a body of doctrine; its nearest parallel is probably to be found in the eclecstic strivings of the Renaissance philosophy and the modernizing tendencies of casalpine humanism. The controversy was assumed to be against prejudice, ignorance, obscurantism; what monks were to Erasmus the clergy as such were to Woolston. Yet English deism was in many ways characteristically English. The deists were, as usually happens with the leaders of English thought, no class of professional men, but represented every rank in the community. They made their appeal in the mother tongue to all men who could read and think, and sought to reduce the controversy to its most direct practical issue. And, with but one or two exceptions, they avoided wiliness in their language as much as in the general scheme of theology they proposed. It at times they had recourse to ambiguity of speech and styled polemics this might be partly excusable when we remember the hanging of Thomas Aikenhead in 1605 for ridiculing the Bible, and Woolston's imprisonment in 1729.

French deism, the direct progeny of the English movement, was equally short-lived. Voltaire during his three years' residence in England (1726-1729) absorbed an enthusiasm for freedom of thought, and provided himself with the arguments necessary to support the deism which he had learned in his youth; he was to the end a deist of the school of Bolingbroke. Rousseau, though not an active assaulter of Christianity, could have claimed kindred with the nobler deists. Diderot was for a time heartily in sympathy with deistic thought; and the Encyclopédie was in its earlier portion an organ of deism. Even in the Roman Catholic Church a large number of the leading divines were frankly deistic, nor were they for that reason regarded as irreligious. But as Locke's philosophy became in France sensationalism, and as Locke's pregnant question, reiterated by Collins, how we know that the divine power might not confer thought on matter, led the way to dogmatic materialism, so deism soon gave way to forms of thought more directly and completely subversive of the traditional theology. None the less it is unquestionable that in the period preceding the Revolution the bulk of French thinkers were ultimately deists in various degrees, and that deism was a most potent factor not only in speculative but also in social and political development. Many of the leaders of the revolutionary movement were deists, though it is quite false to say that the extreme methods of the movement were the result of widespread rationalism.

In Germany there was a native free-thinking theology nearly contemporary with that of England, whence it was greatly developed and supplemented. Among the earliest names are those of Georg Schade (1712-1705), J. B. Basdevot (1723-1700), the educationist, Johann August Eberhard (q.v.); and K. F. Bahrdt, who regarded Christ as merely a noble teacher like Moses, Confucius and Luther. The compact rational philosophy of Wolff nourished a theological rationalism which in H. S. Reimarus was wholly indistinguishable from dogmatic deism, and was undoubtedly to a great extent adopted by Lessing; while, in the case of the historic-critical school to which J. S. Semler belonged, the distinction is not always easily drawn—although these rationalists professedly recognized in Scripture a real divine revelation, mingled with local and temporary elements. It deserves to be noted here that the former, the theology of the Anfahrung, was, like that of the deists, destined to a short-lived notoriety; whereas the solid, accurate and scholarly researches of the rationalist critics of Germany, undertaken with no merely polemical spirit, not only form an epoch in the history of theology, but have taken a permanent place in the body of the sciences themselves. Before the combined assault of Schleiermacher's subjective theology and the deeper historical insight of the Hegelians, it had found a refuge successively in the Kantian postulates of the practical reason, and in the vague but earnest faith-philosophy of Jacobi.

Outside France, Germany and England, there were no great schools of thought distinctly deistic, though in most countries there is to be found a rationalistic anti-clerical movement which partakes of the character of deism. It seems probable, for example, that in Portugal the marquis de Pombal was in reality a deist, and both in Italy and in Spain there were signs of the same rationalistic revolt. More certain, and also more striking, is the fact that the leading statesmen in the American War of Independence were emphatically deists; Benjamin Franklin (who attributes his position to the study of Shaftesbury and Collins), Thomas Paine, Washington and Jefferson, although they all had the greatest admiration for the New Testament story, denied that it was based on any supernatural revelation. For various reasons the movement in America did not appear on the surface to any great extent, and after the comparative failure of Elihu Palmer's Principles of Nature it expressed itself chiefly in the spread of Unitarianism.

Yet deism, though this deist were forgotten, their spirit was not wholly dead. For men like Hume and Gibbon the standpoint of deism was long left behind; yet Gibbon's famous two chapters might well have been written by a deist. Even now many undoubtedly cling to a theology nearly allied to deism. Rejecting miracles and denying the infallibility of Scripture, protesting against Calvinistic views of sovereign grace and having no interest in evangelical Arminianism, the faith of such inquirers seems fairly to coincide with that of the deists. Even some cultured theologians, the historical representatives of latitudinarianism, seem to accept the great body of what was contended for by the deists. Moreover, the influence of the deistic writers had an incalculable influence in the gradual progress towards tolerance, and in the spread of a broader attitude towards intellectual problems, and this too, though, as we have seen, the original deists devoted themselves mainly to a crusade against the doctrine of revelation.

The original deists displayed a singular incapacity to understand the true conditions of history; yet amongst them there were some who pointed the way to the truer, more generous interpretation of the past. When Shaftesbury wrote that "religion is still a discipline, and progress of the soul towards perfection," he gave birth to the same thought that was afterwards enshrined in Leibniz's Erziehung des Menschengeschlechtes as the dawn of a fuller and purer light on the history of religion and on the development of the spiritual life of mankind.

DEISTER, a chain of hills in Germany, in the Prussian province of Hanover, about 13 m. S.W. of the city of Hanover. It runs in a north-westery direction from Springe in the S. to Rodenberg in the N. It has a total length of 14 m., and rises in the Höfeler to a height of 1250 ft. The chain is well-wooded and abounds in game. There are some coal mines and sandstone quarries.
DÉJAZET—DEKKER, J. DE

DÉJAZET, Pauline Virginie (1798—1879), French actress, born in Paris on the 30th of August 1798, made her first appearance on the stage at the age of five. It was not until 1820, when she began her seven years’ connexion with the recently founded Gymnase, that she won her triumphs in soubrette and “brechee” parts, which came to be known as “Dérajets.” From 1828 she played at the Nouveautés for three years, then at the Variétés, and finally became manager, with her son, of the Folies, which was renamed the Théâtre Dérajet. Here, even at the age of sixty-five, she had marvellous success in youthful parts, especially in a number of Sardou’s earlier plays, previously unacted. She retired in 1868, and died on the 1st of December 1875, leaving a great name in the annals of the French stage.

See Duval’s Virginie Dérajet (1876).

DE KALB, a city of De Kalb county, Illinois, U.S.A., in the N. part of the state, about 58 m. W. of Chicago. Pop. (1890) 2595; (1900) 5004 (1520 foreign-born); (1910) 8102. DeKalb is served by the Chicago Great Western, the Chicago & North-Western, and the Illinois, Iowa & Minnesota railroads, and by interurban electric lines. It is the seat of the Northern Illinois state normal school (opened in 1890). The principal manufac- tures are shoes, barbed wire, wagons and agricultural implements, pianos, shoes, gloves, and creamery packages. The city has important dairy interests also. De Kalb was first settled in 1832, was known as Buena Vista until 1840, was incorporated as a village in 1861, and in 1877 was organized under the general state law as a city.

DE KEYSER, Thomas (1596 or 1597—1667), Dutch painter, was born at Amsterdam, the son of the architect and sculptor Hendrik de Keyser. We have no definite knowledge of his training, and but scant information as to the course of his life, though it is known that he owned a basalt business between 1640 and 1654. Aert Pietersz, Cornelis van der Vort, Werner van Valckert and Nicolas Elias are accredited by different authorities with having developed his talent; and M. Karl Woermann, who has pronounced in favour of Nicolas Elias is supported by the fact that almost all that master’s pictures are formerly attributed to De Keyser, who, far from exercising any influence upon Rembrandt when he first went to Amsterdam in 1621, De Keyser chiefly excelled as a portrait painter, though he also executed some historical and mythological pictures, such as the “Theseus” and “Ariadne” in the Amsterdam town hall. His portraiture is full of character and masterly in handling, and, often, as in the “Old Woman” of the Budapest gallery, is distinguished by a rich golden glow of colour and Rembrandt-esque chiaroscuro. Some of his portraits are life-size, but the artist generally preferred to keep them on a considerably smaller scale, like the famous “Group of Amsterdam Burgomasters” assembled to receive Marie de’ Medici in 1638, now at the Hague museum. The sketch for this important painting, together with three other drawings, was sold at the Gallitzin sale in 1798 for the sum of threepence. The German emperor owns an “Equestrian Portrait of a young Dutchman,” by De Keyser, a later work which in general disposition and in the soft manner of painting recalled the work of Cuyp. Similar pictures are in the Dresden and Frankfort museums, in the Heyl collection at Worms, and the Liechtenstein Gallery in Vienna. The National Gallery, London, owns a characteristic portrait group of a “Merchant with his Clerk”; the Hague museum, besides the group already referred to, a magnificent “Portrait of a Savant,” and the Haarlem museum a fine portrait of “Claes Fabricius.” At the Ryks Museum in Amsterdam there are no fewer than twelve works from his brush, and other important examples are to be found in Brussels, Munich, Copenhagen and St. Petersburg.

DEKKER, Edward Douwe (1820—1887), Dutch writer, commonly known as Multatuli, was born at Amsterdam on the 2nd of March 1820. His father, a ship’s captain, intended his son for trade, but this humdrum prospect disgusts him, and in 1838 he went out to Java, and obtained a post in the Inland Revenue. He rose from one position to another, until, in 1851, he found himself assistant-resident at Amboyna, in the Moluccas. In 1857 he was transferred to Lebak, in the Bantam residency of Java. By this time, however, all the secrets of Dutch administration were known to him, and he had begun to protest against the abuses of the colonial system. In consequence he was threatened with dismissal from his office for his openness of speech, and, to avoid his appointment, he returned to Holland in a state of fierce indignation. He determined to expose in detail the scandals he had witnessed, and he began to do so in newspaper articles and pamphlets. Little notice, however, was taken of his protestations until, in 1860, he published, under the pseudonym of “Multatuli,”...
yet effective irony, it is usually ranked by critics along with Erasmus's Praise of Folly. Dekker died at Amsterdam in November 1666.

A complete collection of his poems, edited by Brouerius van Nideck, was published at Amsterdam in 1726 under the title Exercices politiques (2 vols. 4to.). Selections from his poems are included in Siegenbeek's Proven of nederduitsche Dickhunde (1823), and from his epigrams in Geilsbeck's Epigrammatische Anthologie (1827).

DEKKER (or DECKER), THOMAS (c. 1570-1641), English dramatist, was born in London. His name occurs frequently in Henslowe's Diary during the last three years of the 16th century; he is mentioned there as receiving loans and payments for writing plays in conjunction with Ben Jonson, Drayton, Chettle, Haughton, Wilson, Day and others, and he would appear to have been then in the most active employment as a playwright. The titles of the plays on which he was engaged from April 1599 to March 1599/1600 are Troilus and Cressida, Orestes Furies, Agamemnon, The Gentle Craft, The Stepmother's Tragedy, Bear a Brain, Page of Plymouth, Robert the Second, The Whole History of Fortunatus; Patient Grisel, Truth's Supplication to Candlelight, The Spanish Moor's Tragedy, The Seven Wise Makers. At what date it is exact that Dekker's services were in great request for the titles is not recorded. He is first mentioned in the Diary under date 8th of January 1599/1598, as having sold a book, i.e. the manuscript of a play; the payments in 1599 are generally made in advance, "in earnest" of work to be done. In the case of three of the above plays, Orestes Furies, Truth's Supplication and The Gentle Craft, Dekker is paid as the sole author. Only The Gentle Craft has been preserved; it was published anonymously in 1600 under the title of The Shoemaker's Holiday. It would be unsafe to argue from the classical subjects of some of these plays that Dekker was then a young man from the university, who had come up like so many others to make a living by writing for the stage. Classical knowledge was then in the air; playwrights in want of a subject were content with translations, if they did not know the originals. However educated, Dekker was then a young man just out of his teens, if he spoke with any accuracy when he said that he was three score in 1597. And it was not in scholarly themes that he was destined to find his true vein. The call for the publication of The Gentle Craft, which deals with the life of the city, showed that his heart was with lay.

To give a general idea of the substance of Dekker's plays, there is no better way than to call him the Dickens of the Elizabethan period. The two men were as unlike as possible in their habits of work, Dekker having apparently all the thriftlessness and impecunious shamelessness of Micawber himself. Henslowe's Diary contains two notes of payments made in 1597/1598 and 1598/1599 to release Dekker from prison, and he is supposed to have spent the years between 1613 and 1616 in the King's Bench. Dekker's Bohemianism appears in the slightness and hurry of his work, a strong contrast to the thoroughness and rich completeness of every labour to which Dickens applied himself; perhaps also in the exquisite freshness and sweetness of his songs, and the natural charm of stray touches of expression and description in his plays. But he was like Dickens in the bent of his genius towards the representation of the life around him in London, as well as in the humorous kindliness of his way of looking at that life, his vein of sentiment, and his eye for odd characters, though the random pickings of Dekker, hopping here and there in search of a subject, give less complete results than the more systematic labours of Dickens. Dekker's Simon Eyer, the good-hearted, mad shoemaker, and his Orlando Friscobaldo, are touched with a kindly humour in which Dickens would have delighted; his Infelices, Fiamettas, Tomirriales, even his Bellafront, have a certain likeness in type to the heroines of Dickens; and his roaring blades and their gulls are prototypes of Sir Mulberry Hawk and Lord Frederick Verisopht. Only there is this great difference in the spirit of the two writers, that Dekker wrote without the smallest apparent wish to reform the life that he saw, desiring only to exhibit it; and that on the whole, apart from his dramatist's necessity of finding interesting matter, he cast his eye about with a liking for the discovery of good under unpromising appearances than with any determination to detect and expose vice. The observation must also be made that Dekker's personages have much more individual character, more of that mixture of good and evil which we find in real human beings. Hack-writer though Dekker was, and writing often under sore pressure, there is no dramatist whose personages have more of the breath of life in them; drawing with easy, unconstrained hand, he was a master of those touches by which an imaginary figure is brought home to us as a creature with human interests. A very large part of the motive power in his plays consists in the temporary yielding to an evil passion. The kindly philosophy that the best of nature may be for a time perverted by passionate desires is the chief animating principle of his comedy. He delights in showing women listening to temptation, and apparently yielding, but still retaining sufficient control over themselves to be capable of drawing back when on the verge of the precipice. The wives of the citizens were his heroines, pursued by the unlawful addresses of the gay young courtiers; and on the whole Dekker, from inclination apparently as well as policy, though himself, if Ben Jonson's satire had any point, a bit of a dandy in his youth, took the part of moralist, and either struck the rakes with remorse or made the objects of their machinations clever enough to outwit them. From Dekker's plays we get a very lively impression of all that was picturesque and theatrically interesting in the city life of the time, the interiors of the shops and the houses, the tastes of the citizens and their wives, the tavern and tobacco-shop manners of the youthful aristocracy and their satellites. The social student cannot afford to overlook Dekker; there is no other dramatist of that age, except Thomas Middleton, from whom we can get such a vivid picture of contemporary manners in London. He drew direct from life; in so far as he idealized, he did so not in obedience to scholarly precepts or dogmatic theories, but in the immediate interests of good-natured farce and tender-hearted sentiment.

In all the serious parts of Dekker's plays there is a charming delicacy of touch, and his smallest scraps of song are bewitching; but his plays, as plays, owe much more to the interest of the characters and the incidents than to any excellence of construction. We see what use could be made of his materials by a stronger intellect in Westward Ho! which he wrote in conjunction with John Webster. The play, somehow, though the parts are more firmly knit together, and it has more unity of purpose, is not so interesting as Dekker's unaided work. Middleton formed a more successful combination with Dekker than Webster; there is some evidence that in The Honest Whore, or The Converted Courtesan, which is generally regarded as the best that bears Dekker's name, he had the assistance of Middleton, although the assistance was so immaterial as not to be worth acknowledging in the title-page. Still that Middleton, a man of little genius but of much practical talent and robust humour, was serviceable to Dekker in determining the form of the play may well be believed.

The two wrote another play in concert, The Roaring Girl, for which Middleton probably contributed a good deal of the matter, as well as a more symmetrical form than Dekker seems to have been capable of devising. In The Witch of Edmonton, except in a few scenes, it is difficult to trace the hand of Dekker with any certainty; his collaborators were John Ford and William Rowley; to Ford probably belongs the intense brooding and murderous wrath of the old hag, which are too direct and hard in their energy for Dekker, while Rowley may be supposed to be responsible for the delineation of country life. The Virgin Martyr, one of the best constructed of his plays, was written in conjunction with Massinger, to whom the form is no doubt due. Dekker's plays contain a few songs which show him to have been possessed of very great lyrical skill, but of this he seems to have made hardly any use. His poem of Canaans Calamities—if indeed it be his, which is hard to believe—is exceedingly poor stuff, and the verse portion of his Dreame, though containing some good lines, is, as a whole, not much better.

When Gerard Langbaine wrote his Account of the English Dramatic Poets in 1691, he spoke of Dekker as being 'more famous for the contention he had with Ben Jonson for the bays,
than for any great reputation he had gained by his own writings.”

This is an opinion that could not be professed now, when Dekker’s work is read. In the contention with Ben Jonson, one of the most celebrated quarrels of authors, the origin of which is matter of dispute, Dekker seems to have had very much the best of it. We can imagine that Jonson’s attack was stirring at the time, because it seems to be full of sarcastic personalities, but it is dull enough now when nobody knows what Dekker was like, nor what was the character of his mother. There is nothing in the Poetaster that has any point as applied to Dekker’s powers as a dramatist, while, on the contrary, Satriomastix, or the Unravelling of the Humorous Poet is full of pungent ridicule of Jonson’s style, and of retorts and insults conceived in the happiest spirit of good-natured mockery. Dekker has been accused of poverty of invention in adopting the character of the Poetaster, but it is of the very pith of the jest that Dekker should have set out on Jonson’s own foul-mouthed Captain Tucca to abuse Horace himself.

Works.—The Pleasant Comedy of Old Fortunatus (1600); The Shaksperes Play-House, or The Gentle Craft. With the humorous life of Simon Eyre, shooemaker, and Lord Mayor of London (1600); Satriomastix. Or the unravelling of the Humorous Poet (1602); The Pleasant Comedy of Patient Grissil (1603), with Chettle and Houghton. This was written in 1602, and published by H. Man and the Longing Wife (1604); North-Ward Hoe (1607), with John Webster; West-Ward Hoe (1607), with John Webster; The Whore of Babylon (1607); The Famous History of Sir Thomas Wyat. With the Life of Sir William Wynne the Poet (1607), with John Webster; the Roaring Girle. Or Moli Cut-Purse (1611), with Thomas Middleton; The Virgin Martyr (1622), with Massinger: If It Be Not Good, the Devil is in It (1612); The Second Part of the History of the Patrician (1614); The Impudent Wife; the Honest Whore, persuaded by strong arguments to turne Histrian againe; her brave refruing those Arguments. And lastly, the Comical Passages of an Italian Bridelcow, where the Scenie ends (1630). A Tragi-Comedy: called Matter of Honour in London (1631). The Tragedy of the Dead Man (1605). The Witch of Edmonston. A true story. Composed into a Tragi-Comedy (1658), with William Rowley and John Ford. The Sun’s Darling (1656) was possibly written by Ford and Dekker, or may be perhaps more correctly considered as a recast of Ford’s only major play, perhaps his last lost play of Phæton. The pageant for the Lord Mayor’s shows of 1612 and 1629 were written by Dekker, and both are preserved. His tracts are invaluable for the light which they throw on the London of his time, especially in their descriptions of the circumstances of the theatre. Their titles, many of which are necessarily abbreviated, are: Cannaens Calumet, Jerusalem’s Miseries, and England’s Mirror (1598), in verse; The Wonderfull Yeare (1603). When the first Earl of Southampton was sorely sick (1602); The Batchelors Banquet (1603): a brilliant adaptation of Les Quinseoyes de mariage; the Seven Deadly Sinnes of London (1605); News from Belf, brought by the Divine Carriar (1606), reprinted in 1612. The Earle of Essex being somewhat wounded, A Knights Conjuring: Jests to make you Merle (1607), with George Wilkins; The Belman of London: Bringing to Light the most notorious villanies that are now practised in the Kingsmeade (1668); followed by a second part, and enlarged editions under other titles, The Dead Treatise (1608); The Rosens Almancke, foretelling of a Plague, Famine and Civil Warre (1609), ridiculing the almanac makers; The Guls Horbe-booke (1609), the most famous of all his tracts, providing a code of manners for the Elizabethan gallant, in the style of St Pals: at the ordinary, at the playhouse, and other resorts; Works for Armourours, or the Peace is Broken (1609); Foure Birds of Noahs Ark (1609); A Strange Horse-Race (1615); Dekker’s Dreames (1620). In verse and prose, illustrated with woodcuts of his dreams and his wife’s dreams (1615). This long list does not exhaust Dekker’s work, much of which is lost.

Authorities.—An edition of the collected dramatic works of Dekker by R. H. Shepherd appeared in 1873; his prose tracts, poems, and translations are well known. Among the plays, both these contain memoirs of him, but by far the most complete account of his life and writings is to be found in the article by A. H. Bullen in the Dictionary of National Biography. See also the introduction and the notes of his Plays, by Grosart (1831), 1, 115, &c., and, for his quarrel with Ben Jonson, Prof. J. H. Penniman’s War of the Theatres (Boston, 1867) and Mr. R. A. Small’s Stage Quarrel between Ben Jonson and the so-called Theatricals (1890); also Beale’s edition for the Mermaid Series (1887); new series, 1904) by Ernest Rhys. An essay on Dekker by A. C. Swinburne appeared in The Nineteenth Century for January 1887. (W. M.; R. B. McK.)

DE LA BECHE, SIR HENRY THOMAS (1766-1855), English geologist, was born in the year 1766. His father, an officer in the army, possessed landed property in Jamaica, but died while his son was still young. The boy accordingly spent his youth with his mother at Lyme Regis among the interesting and picturesque coast cliffs of the south-west of England, where he imbibed a love for geological pursuits and cultivated a marked artistic faculty. When fourteen years of age, being destined, like his friend Murchison, for the military profession, he entered the college at Great Marlow, where he distinguished himself by the rapidity and skill with which he executed sketches showing the salient features of a district. The peace of 1815, however, changed his career and he devoted himself with ever-increasing assiduity to the pursuit of geology. When only twenty-one years of age he joined the Geological Society of London, continuing throughout life to be one of its most active, useful and honoured members. He was president in 1845-1849. Possessing a fortune sufficient for the gratification of his tastes, he visited many localities of geological interest, not only in Britain, but also on the continent, in France and Switzerland. His journeys seldom failed to bear fruit in suggestive papers accompanied by sketches. Early attachment to the south-west of England led him back to that region, where, with enlarged experience, he began the detailed investigation of the rocks of Cornwall and Devon. Thrown much into contact with Dr. R. W. Boulger and Dr. R. W. Boulger and, when he received the idea that the nation ought to compile a geological map of the United Kingdom, and collect and preserve specimens to illustrate, and aid in further developing, its mineral industries. He showed his skilful management of affairs by inducing the government of the day to recognize his work and give him an appointment in connexion with the Ordnance Survey. This formed the starting point of the present Geological Survey of Great Britain, which was officially recognized in 1835, when De la Beche was appointed director. Year by year increasing stores of valuable specimens were transmitted to London; and the building at Craig’s Court, where the young Museum of Economic Geology was placed, became too small. But De la Beche, having seen how fruitful his first idea had become, appealed to the authorities not merely to provide a larger structure, but to widen the whole scope of the scientific establishment of which he was the head, so as to impart to it the character of a great educational institution where practical as well as theoretical instruction should be given in every branch of science necessary for the conducting of mining work. His numberless papers and valuable contributions to the geological literature of the country secured for him the name of father of British geology. Among his many other important labours, he was the first to realize the importance of collecting references to the science. De la Beche published numerous memoirs on English geology in the Transactions of the Geological Society of London, as well as in the Memoirs of the Geological Survey, notably the Report on the Geology of Cornwall, Devon and West Somerset (1839). He likewise wrote A Geological Manual (1831; 3rd ed., 1845); and a book of singular breadth and clearness—Researches in Theoretical Geology (1842), in which he enunciated his philosophical treatment of geological questions much in advance of his time. An early volume, How to Observe Geology (1835 and 1836), was rewritten and enlarged by him late in life, and published under the title of The Geological Observer (1852: 2nd ed., 1853). It was marked by wide practical experience, multifarious knowledge, philosophical insight and a genius for artistic delineation of geological phenomena. He was elected F.R.S. in 1819. He received the honour of knighthood in 1848, and near the close of his life was awarded the Wollaston medal—the highest honour in the gift of the Geological Society of London. After a life of constant activity he began to suffer from partial paralysis, but, though becoming gradually worse, continued able to transact
his official business until a few days before his death, which took place on the 13th of April 1855.

**DELABORDE—DE LA GARDIE**

DELACROIX, FERDINAND VICTOR EUGENE (1798-1863), French historical painter, leader of the Romantic movement, was born at Charenton-St-Maurice, near Paris, on the 26th of April 1798. His father Charles Delacroix (1741-1803) was a partisan of the most violent faction during the time of the Revolution, and was foreign minister under the Directory. The family affairs seem to have been conducted in the wildest manner, and the accidents that befell the child, well authenticated as they are said to be, make it almost a miracle that he survived. He was nearly burned to death in the cradle by a nurse falling asleep over a novel and the candle dropping on the coverlet; this left permanent marks on his arms and face. He was next dropped into the sea by another bonne, who was climbing up a ship's side to save another child. He was nearly poisoned, and nearly choked, and to crown all, he tried to hang himself without any benefit. He attempted suicide, in imitation of a print exhibiting a man in that position of final ignominy. The prediction of a charlatan founded on his horoscope has been preserved: "Cet enfant deviendra un homme célèbre, mais sa vie sera des plus laborieuses, des plus tourmentées, et toujours livrée à la contradiction."

Delacroix the elder (also known as Delacroix de Contaut) died at Bordeaux when Eugène was seven years of age, and his mother returned to Paris and placed him in the Lycée Napoléon. Afterwards, on his determining to be a painter, he entered the atelier of Baron Guérin, who affected to treat him as an amateur. His fellow-pupil was Ary Scheffer, who was alike by temperament and antecedents the opposite of the *bizarre* Delacroix, and the two remained antagonistic to the end of life. Delacroix’s acknowledged power and yet want of success with artists and critics—Thiers being his only advocate—perhaps mainly resulted from his bravura and rude dash in the use of the brush, at a time when smooth roundness of surface was general. His first important picture, "Dante and Virgil," was painted in his own studio; and when Guérin went to see it he flew into a passion, and told him his picture was absurd, detestable, exaggerated.

"What was to come and see this? you knew what I must say," Yet his work was received at the Salon, and produced an enthusiasm of debate (1822). Some said Géricault had worked on it, but all treated it with respect. Still in private his position, even after the larger tragic picture, the "Massacre of Chios," had been deposited in the Luxembourg by the government (1824), became that of an Ishmaelite. The war for the freedom of Greece then came on, moved him deeply; and his next two pictures, "Marino Faliero Decapitated on the Giant's Staircase of the Ducal Palace" (which has always remained a European success), and "Greece Lamenting on the Ruins of Missolonghi"—with many smaller works, were exhibited for the benefit of the patriots in 1826. This exhibition was much visited by the public, and next year he produced another of his important works, "Sardanapalus," from Byron's drama. After this, he says, "I became the abomination of painting, I was refused water and salt."—but, he adds with singularly happy naïveté, "J'étais enchanté de moi-même!" The patrony he inherited, or perhaps it should be said, what remained of it, was 10,000 livres de rente, and with economy he lived on this, and continued the expensive process of painting large historical pictures. In 1831 he reappeared in the Salon with six works, and immediately after left for Morocco, where he found much congenial matter. Delacroix never went to Italy; he refused to go on principle, lest the old masters, either in spirit or manner, should impair his originality and self-dependence. His greatest admiration in literature was the poetry of Byron; and Shakespeare also attracted him for tragic inspirations; and of course classic subjects had their turn of his easel. He produced his work indefatigably, having his pictures very seldom favourably received at the Salon. These were sometimes very large, full of incidents, with many figures. "Drawing of Lots in the Boat at Sea," from Byron's *Don Juan*, and the "Taming of Constantinople by the Christians," were of that character, and the former was one of his noblest creations. In 1845 he was employed to decorate the library of the Luxembourg, that of the chamber of deputies in 1847, the ceiling of the gallery of Apollo in the Louvre in 1849 and that of the Salon de la Paix in the hôtel de ville in 1853. He died on the 13th of August 1863, and in August 1864 an exhibition of his works was opened on the Boulevard des Italiens. It contained 174 pictures, many of them of large dimensions, and 303 drawings, showing immense perseverance as well as energy and versatility. As a colourist, and a romantic painter, he now ranks among the greatest of French artists.

See also A. Rohaut, *Delacroix* (1885); E. Dargenton, *Delacroix par lui-même* (1885); G. Moreau, *Delacroix et son aïeule* (1893); Dorothy Burak, *Eugène Delacroix* (1906).

**DE LA GARDIE, MAGNUS GABRIEL, COUNT (1622-1688), Swedish statesman, the best-known member of an ancient family of French origin (the *D'Escoueries de Languedoc*) which had been naturalized Swedish since the 14th century. After a careful education, completed by the usual grand tour, Magnus learned the art of war under Gustavus Horn, and during the reign of Christina (1644-1654), whose prime favourite he became, though the liaison was innocent enough, he was raised to the highest offices in the state and loaded with distinctions. In 1646 he was sent at the head of an extraordinary mission to France, and on his return married the queen’s cousin Marie Euphrosyne of Zwei-brücken, who, being but a poor princess, benefited greatly by her wedding with the richest of the Swedish magnates. Immediately afterwards, De la Gardie was made a senator, governor-general of Saxony during the last stages of the Thirty Years' War, and, in 1652, lord high treasurer. In 1653 he fell into disgrace and had to withdraw from court. During the reign of Charles X. (1654-1660) he was employed in the Baltic provinces both as a civilian and a soldier, although in the latter capacity he gave the military king but little satisfaction. Charles X. nevertheless, in his last will, appointed De la Gardie grand-chancellor and a member of the council of regency which ruled Sweden during the minority of Charles XI. (1666-1672). During this period De la Gardie was the ruling spirit of the government and represented the party of warlike adventure as opposed to the party of peace and economy led by Counts Bonde and Brahe (995). After a severe struggle De la Gardie's party finally prevailed, and its triumph was marked by that general decline of personal and political morality which has given to this regency its undeniable reputation.
It was De la Gardie who first made Sweden the obsequious hirpling of the foreign power which had the longest purses. The best wing of this shameful "subsidy policy" was the treaty of Fontainebleau, 1661, by a secret paragraph of which Sweden, in exchange for a considerable sum of money, undertook to support the French candidate on the first vacancy of the Polish throne. It was not, however, until the 14th of April 1672 that Sweden, by the treaty of Stockholm, became a regular "mercenary Galliae," pledging herself, in return for 400,000 étous per annum in peace and 600,000 in war time, to attack with 16,000 men those German princes who might be disposed to assist Holland. The early disasters of the unlucky war of 1675-1679 were rightly attributed to the carelessness, extravagance, procrastination and general incompetence of De la Gardie and his high aristocratic colleagues. In 1673 a special commission was appointed to inquire into their conduct, and on the 27th of May 1683 it decided that the regents and the senate were solely responsible for dilapidations of the realm, the compensation due by them to the crown being assessed at 4,000,000 dalers or £500,000. De la Gardie was treated with relative leniency, but he "received permission to retire to his estates for the rest of life" and died there in comparative poverty, a mere shadow of his former magnificent self. The best sides of his character were his brilliant social gifts and his intense devotion to literature and art.

(R. N. B.)

DELAGOA BAY (Port. for the bay "of the lagoon"), an inlet of the Indian Ocean on the east coast of Africa, between 25° 40' and 26° 20' S., with a length from north to south of over 70 m. and a breadth of about 20 m. The bay is the northern termination of the series of lagoons which line the coast from St. Lucia Bay. The opening is toward the N.E. The southern part of the bay is formed by a peninsula, called the Inyak peninsula, which on its inner or western side affords safe anchorage. At its N.W. point is Port Melville. North of the peninsula is Inyak Island, and beyond it a smaller island known as Elephant's Island.

In spite of a bar at the entrance and a number of shallows within, Delagoa Bay forms a valuable harbour, accessible to large vessels at all seasons of the year. The surrounding country is low and very unhealthy, but the island of Inyak has a height of 240 ft., and is used as a sanatorium. A river 12 to 18 ft. deep, known as the Manhiss or Komati, enters the bay at its northern end; several smaller streams, the Matolla, the Umbeloz, and the Tembi, from the Lebombo Mountains, meet towards the middle of the bay in the estuary called by the Portuguese the Espirito Santo, but generally known as the English river; and the Maputa, which has its headwaters in the Drakensberg, enters in the south, as also does the Umfusi river. These rivers are the haunts of the hippopotamus and the crocodile.

The bay was discovered by the Portuguese navigator Antonio de Campo, one of Vasco da Gama's companions, in 1502, and the Portuguese post of Lourenço Marques was established not long after on the north side of the English river. In 1730 the Dutch East India Company built a fort and "factories" on the spot which Lourenço Marques now stands; but in 1790 the settlement was abandoned. Thereafter the Portuguese had intermittently—trading stations in the Espirito Santo. These stations were protected by small forts, usually incapable, however, of withstanding attacks by the natives. In 1832 Captain (afterwards Vice-Admiral) W. F. W. Owen, of the British navy, finding that the Portuguese exercised no jurisdiction south of the settlement of Lourenço Marques, concluded treaties of cession with native chiefs, hoisted the British flag, and appropriated the country from the English river southwards; but when he visited the bay again in 1834 he found that the Portuguese, disregarding the British treaties, had concluded others with the natives, and had endeavoured (unsuccessfully) to take military possession of the country. Captain Owen hoisted the British flag, but the sovereignty of either power was left undecided till the claims of the Transvaal Republic rendered a solution of the question urgent. In the meantime Great Britain had taken no steps to exercise authority on the spot, while the ravages of Zulu hordes confined Portuguese authority to the limits of their fort. In 1835 Boers, under a leader named Orich, had attempted to form a settlement on the bay, which is the natural outlet for the Transvaal; and in 1868 the Transvaal president, Marthinus Pretorius, claimed the country on each side of the Maputa down to the sea. In the following year, however, the Transvaal acknowledged Portugal's sovereignty over the bay. In 1861 Captain Bickford, R.N., had declared Inyak and Elephant islands British territory; an act protested against by the Lisbon authorities. In 1872 the dispute between Great Britain and Portugal was submitted to the arbitration of M. Thierry, the French president; and on the 10th of April 1875 his successor, Marshal MacMahon, declared in favour of the Portuguese. It had been previously agreed by Great Britain and Portugal that the right of pre-emption in case of sale or cession should be given to the unsuccessful claimant to the bay. Portuguese authority over the interior was not established until some time after the MacMahon award; nominally the country south of the Maniksha river was ceded to them by the Matabele in 1880, and in 1881.

In 1898 another dispute arose between Portugal and Great Britain in consequence of the seizure by the Portuguese of the railway running from the bay to the Transvaal. This dispute was referred to arbitration, and in 1900 Portugal was condemned to pay nearly £1,000,000 in compensation to the shareholders in the railway company. (See LOURENÇO MARQUES AND GAZALÈM.)

The bay of Delagoa (Délagela, 17th century) was comprehended in a "district" of the ministry of the interior, formed, ... under direction of Captain W. F. W. Owen, R.N. (London, 1835) contains much interesting information concerning the district in the early part of the 19th century.

DELABRE, JEAN BAPTISTE JOSEPH (1749-1822). French astronomer, was born at Amiens on the 19th of September 1749. His college course, begun at Amiens under the abbe Jacques Deville, was finished in Paris, where he took a scholarship in the college of France. Despite extreme penury, he then continued to study indefatigably and in many languages, history and literature, finally turning his attention to mathematics and astronomy. In 1771 he became tutor to the son of M. d'Assy, receiver-general of finances; and while acting in this capacity, attended the lectures of J. J. Lalande, who, with his remarkable acquisitions, induced M. d'Assy in 1788 to install an observatory for his benefit at his own residence. Here Delambre observed and computed almost uninterrupted, and in 1790 obtained for his Tables of Uranus the prize offered by the academy of sciences, of which body he was elected a member two years later. He was admitted to the Institute on its organization in 1795, and became, in 1803, perpetual secretary to its mathematical section. He, moreover, belonged from 1795 to the bureau of longitudes. From 1792 to 1799 he was occupied with the measurement of the arc of the meridian extending from Dunkirk to Barcelona, and published a detailed account of the operations in Base du système métrique (3 vols., 1806, 1807, 1810), for which, in 1810, he was awarded the 5000-franc prize of the faculty of sciences. The first consul nominated him director of selected studies; he succeeded Lalande in 1807 as professor of astronomy at the College of France, and filled the office of treasurer to the imperial university from 1808 until its suppression in 1815. Delambre died at Paris on the 19th of August 1822. His last years were devoted to researches into the history of science, resulting in the successive publication of: Histoire de l'astronomie ancienne (2 vols., 1817); Histoire de l'astronomie au moyen âge (1819); Histoire de l'astronomie moderne (2 vols., 1821); and Histoire de l'astronomie au XVIIIe siècle, issued in 1827 under the care of C. L. Mathieu. These books show marvellous erudition; but some of the judgments expressed in them are warped by prejudice; they are diffuse in style and overloaded with
computations. He wrote besides: *Tables écliptiques des satellites de Jupiter*, inserted in the third edition of J. J. Lalande’s *Astronomie* (1791), and republished in an improved form by the bureau of longitudes in 1817; *Méthodes analytiques pour la détermination d’un arc du méridien* (1799); *Tables du soleil* (publ. by the bureau of longitudes) (1806); *Rapport historique sur les progrès des sciences mathématiques depuis l’an 1789* (1810); *Abrégé d’astronomie* (1813); *Astronomie théorique et pratique* (1814); &c.

DELAMERE—DELANY

DELANE, JOHN THADEUS (1817–1879), editor of *The Times* (London), was born on the 11th of October 1817 in London. He was the second son of Mr W. F. A. Delane, a barrister, of an old Irish family, who about 1832 was appointed by Mr Walter financial manager of *The Times*. While still a boy he attracted Mr Walter’s attention, and it was always intended that he should find work on the paper. He received a good general education at private schools and King’s College, London, and also at Magdalen Hall, Oxford. He graduated after taking his degree in 1840 he at once began work on the paper, though not in the office, but at the bar, being called in 1847. In 1841 he succeeded Thomas Barnes as desk editor, a post which he occupied for thirty-six years. He from the first obtained the best introductions into society and the chief political circles, and had a position there such as no journalist had previously enjoyed, using his opportunities with a sure intuition for the way in which events would move. His staff included some of the most brilliant men of the day, who worked together with a common ideal. The result to the paper, which in those days had hardly any real competitor in English journalism, was an excellence of information which gave it great power. (See Newspapers.) Delane was a man of many interests and great judgment; capable of long application and concentrated attention, with power to seize always on the main point at issue, and rapidly master the essential facts in the most complicated affair. His general policy was to keep the paper a national organ of opinion above party, but with a tendency to sympathize with the Liberal movements of the day. He admired Palmerston and respected Peel, but he also thought it his duty to be clear of both; and it was Lord Aberdeen who, in 1845, told him of the impending repeal of the Corn Laws, an incident round which many incorrect stories have gathered. The history, however, of the events during the thirteen administrations, between 1841 and 1877, in which *The Times*, and therefore Delane, played an important part cannot here be recapitulated. In 1877 his health gave way, and he retired from the editorship; and on the 22nd of November 1879 he died at Ascot. A biography by his nephew, Arthur Irwin Dasein, was published in 1908.

DELANY, MARY GRANVILLE (1700–1788), an English woman of literary tastes, was born at Coulson, Wilts, on the 14th of May 1700. She was a niece of the 1st Lord Lansdowne. In 1717 or 1718 she was unhappily married to Alexander Pendraves, a rich old Cornish landowner, who died in 1724. During a visit to Ireland she met Dean Swift and his intimate friend, the Irish divine, Patrick Delany, whose second wife she became in 1743. After his death in 1768 she passed all her summers with her bosom friend the dowager duchess of Portland. Her character was defined by Mrs Delany herself. She was a virtuous lady, and a woman of strong religious feeling. Mrs Delany seems to have been most genuine, gave her a small house at Windsor and a pension of £300 a year. Fanny Burney (Madame D’Arblay) was introduced to her in 1783, and frequently visited her at her London home and at Windsor, and owed to her friendship her court appointment. At this time Mrs Delany was a charming and sweet old lady, with a reputation for cutting out and making the ingenious “paper mosaics” now in the British Museum; she had known every one worth knowing in her day.
had corresponded with Swift and Young, and left an interesting picture of the polite but commonplace English society of the 18th century in her six volumes of Autobiography and Letters. Burke calls her "a real fine lady"—"the model of an accomplished woman of former times." She died on the 15th of April 1788.

DE LA REY. JACOBUS HERCULES (1847— ), Boer soldier, was born in the Lichtenburg district, and in his youth and early manhood saw much service in savage warfare. In 1893 he entered the Volksraad of the South African Republic, and was an active supporter of the policy of General Joubert. At the outbreak of the war with Great Britain in 1899 De La Rey was made a general, and he was engaged in the western campaign against Lord Methuen and Lord Roberts. He won his first great success at Natal's Nek on the 11th of July 1900, where he compelled the surrender of a strong English detachment. In the second or guerrilla stage of the war De La Rey became one of the most conspicuously successful of the Boer leaders. He was assistant to General Louis Botha and a member of the government, with charge of operations in the western Transvaal. The principal actions in which he was successful (see also D.L.A. in Vol. I. History) were Nooitgedacht, Vlakfontein and the defeat and capture of Lord Methuen at Klerksdorp (March 7, 1902). The British general was severely wounded in the action, and De La Rey released him at once, being unable to afford him proper medical assistance. This humanity and courtesy marked De La Rey's conduct throughout the war, and even more than his military skill and daring earned for him the esteem of his enemies.

After the conclusion of peace De La Rey, who had borne a prominent part in the negotiations, visited Europe with the other generals, with the intention of raising funds to enable the Boers to resettle their country. In December 1903 he went on a mission to India, and induced the whole of the Boer prisoners of war detained at Ahmednagar to accept the new order of things and to take the oath of allegiance. In February 1907 General De La Rey was returned unopposed as member for Ventersdorp in the legislative assembly of the first Transvaal parliament under self-government.

DE LA RIVE. AUGUSTE ARTHUR (1801-1873), Swiss physicist, was born at Geneva on the 9th of October 1801. He was the son of Charles Gaspard de la Rive (1770-1854), who studied medicine at Edinburgh, and after practising for a few years in London, became professor of pharmaceutical chemistry at the academy of Geneva in 1802 and rector in 1823. After a brilliant career as a student, he was appointed at the age of twenty-two to the chair of natural philosophy in the academy of Geneva. For some years after his appointment he devoted himself specially, with Frédéric Marcet (1803-1883), to the investigation of the specific heat of gases, and to observations for determining the temperature of the earth's crust. Electrical studies, however, engaged most of his attention, especially in connexion with the theory of the voltaic cell and the electric discharge in rarefied gases. His researches on the last-mentioned subject led him to form a new theory of the aurora borealis. In 1840 he described a process for the electro-plating of silver and brass, for which in the following year he received a prize of 3000 francs from the French Academy of Sciences. Between 1854 and 1858 he published a Traité de l'électricité théorique et appliquée, which was translated into several languages. De la Rive's birth and fortune gave him considerable social and political influence. He was distinguished for his hospitality to literary and scientific men, and for his interest in the welfare and independence of his native country. In 1880, when the annexation of Savoy and Nice had led the Genevese to fear French aggression, de la Rive was sent by his fellow-citizens on a special embassy to England, and succeeded in securing a declaration from the English government, which was communicated privately to that of France, that any attack upon Geneva would be regarded as a casus belli. On the occasion of this visit the university of Oxford conferred upon de la Rive the honorary degree of D.C.L. When on his way to pass the winter at Cannes he died suddenly at Marseilles on the 27th of November 1873.

His son, Lucien de la Rive, born at Geneva on the 3rd of April 1834, published papers on various mathematical and physical subjects, and with Édouard Sarasin carried out investigations on the propagation of electric waves.

DELA ROCHE, HIPPOLYTE, commonly known as Paul (1797-1856), French painter, was born in Paris on the 15th of July 1797. His father was an expert who had made a fortune, to some extent, by negotiating and cataloguing, buying and selling. He was proud of his son's talent, and able to forward his artistic education. The master selected was Gros, then painting life-size histories, and surrounded by many pupils. In no haste to make an appearance in the Salon, his first exhibited picture was a large one, "Josabeth saving Joas" (1822). This picture led to his acquaintance with Géricault and Delacroix, with whom he remained on the most friendly terms, the three forming the central group of a numerous body of historical painters, such as perhaps never before lived in one locality and at one time.

From 1822 the record of his life is to be found in the successive works coming from his hand. He visited Italy in 1838 and 1843, when his father-in-law, Horace Vernet, was director of the French Academy at Rome. His studio in the rue Mazarine, where he never spent a day without some good result, is a place of reverence and his knowledge great. His subjects, definitely expressed and popular in their manner of treatment, illustrating certain views of history dear to partisans, yet romantic in their general interest, were painted with a firm, solid, smooth surface, which gave an appearance of the highest finish. This solidity, found also on the canvases of Vernet, Scheffer, Leopold Robert and Ingres, was the manner of the day. It repudiates the technical charm of texture and variety of handling which the English school inherited as a tradition from the time of Reynolds; but it is more easily understood by the world at large, since a picture so executed depends for its interest rather on the history, scene in nature or object depicted, than on the executive skill, which may or may not be critically appreciated. We may add that his point of view of the historical characters which he treated is not always just. "Cromwell lifting the Coffin-lid and looking at the Body of Charles," is an incident only to be excused by an improbable tradition; but "The King in the Guard-Room," with villainous roundhead soldiers blowing tobacco smoke in his patient face, is a libel on the Puritans; and "Queen Elizabeth dying on the Ground," like a she-dragon no one dares to touch, is sensational; while the "Execution of Lady Jane Grey" is represented as taking place in a dungeon. Nothing can be more incorrect than this last as a reading of English history, yet we forget the inaccuracy in admiration of the treatment which represents Lady Jane, with bandaged sight, feeling for the block, her maids covering their faces, and none with their eyes visible among the many figures.

On the other hand, "Stratford led to Execution," when Laud stretches his lawn-covered arms out of the small high window of his cell to give him a blessing as he passes along the corridor, is perfect; and the splendid scene of Richelieu in his gorgeous barge, preceding the boat containing Cinque-Mars and De Thou carried to execution by their guards, is perhaps the most dramatic semi-historical work ever done. "The Princes in the Tower" must also be mentioned as a very complete creation; and the "Young female Martyr floating dead on the Tiber," is so pathetic that one could hardly look at it. As a realization of a page of authentic history, again, no picture can surpass the "Assassination of theduc de Guise at Blois." The expression of the murdered man stretched out by the side of the bed, the conspirators all massed together towards the door and far from the body, show exact study as well as insight into human nature. This work was exhibited in his meridian time, 1835; and in the same year he exhibited the "Head of an Angel," a study from Horace Vernet's young daughter Louise, his love for whom was the absorbing passion of his life, and from the shock of whose death, in 1845, it is said he never quite recovered. By far his finest productions after her death are of the most serious character, a sequence of small elaborate pictures of incidents in the Passion. Two of these, the Virgin and the other Mariæ, with the apostles Peter and John, within a nearly dark apartment,
hearing the crowd as it passes hailing Christ to Calvary, and St John conducting the Virgin home again after all is over, are beyond all praise as exhibiting the divine story from a simply human point of view. They are pure and elevated, and also dramatic and painful. Delaroche was not troubled by ideals, and had no affection of them. His sound but hard execution allowed no mystery to intervene between him and his motif, which was always intelligible to the million, so that he escaped all the waste of energy that painters who try to be poets on canvas suffer. Thus it is that essentially the same treatment was applied by him to the characters of distant historical times, the founders of the Christian religion, and the real people of his own day, such as "Napoleon at Fontainebleau," or "Napoleon at St Helena," or "Marie Antoinette leaving the Convention." After her sentence.

In 1837 Delaroche received the commission for the great picture, 27 mètres loz, in the hemicycle of the lecture theatre of the École des Beaux Arts. This represents the great artists of the modern ages assembled in groups on either hand of a central elevation of white marble steps, on the topmost of which are three thrones filled by the architects and sculptors of the Parthenon. To supply the female element in this vast composition he introduced the genius or muses, who symbolize or reign over the arts, leaning against the balustrade of the steps, beautiful and queenly figures with a certain antique perfection of form, but not informed by any wonderful or profound expression. The portrait figures are nearly all unexceptional and admirable. This great and successful work is on the wall itself, an inner wall however, and is executed in oil. It was finished in 1841, and considerably injured by a fire which occurred in 1855, which injury he immediately set himself to remedy (finished by Robert-Fleury); but he died before he had well begun, on the 4th of November 1856.

Personally Delaroche exercised even a greater influence than by his works. Though short and not powerfully made, he impressed every one as rather tall than otherwise; his physiognomy was accentuated and firm, and his fine forehead gave him the air of a minister of state.

See Rees, Delaroche (London, 1880). (W. B. Sc.)

DELARUE—GERVAIS 1751—1835. French historical investigator, formerly regarded as one of the chief authorities on Norman and Anglo-Norman literature, was a native of Caen. He received his education at the university of that town, and was ultimately raised to the rank of professor. His first historical enterprise was interrupted by the French Revolution, which forced him to take refuge in England, where he took the opportunity of examining a vast mass of original documents in the Tower and elsewhere, and received much encouragement, from Sir Walter Scott among others. From England he passed over to Holland, still in prosecution of his favourite task; and there he remained till in 1798 he returned to France. The rest of his life was spent in his native town, where he was chosen principal of his university. While in England he had been elected a member of the Royal Society of Antiquaries; and in his own country he was made a corresponding member of the Institute, and was enrolled in the Legion of Honour. Besides numerous articles in the Mémoires of the Royal Society of London, the Mémoires de l'Institut, the Mémoires de la Société d' Agriculture de Caen, and in other periodical collections, he published separately Essais historiques sur les Bardes, les Longueurs, and les Trouvères normands and anglo-normands (3 vols., 1834), and Recherches historiques sur la Prairie de Caen (1837); and after his death appeared Mémoires historiques sur le pepinod de Caen (1841), Recherches sur la tapissière de Bayeux (1842), and Nouveaux Essais historiques sur la ville de Caen (1842). In all his writings he displays a strong partiality for everything Norman, and rates the Norman influence on French and English literature as of the very highest moment.

DE LA RUE, WARREN (1815—1880). British astronomer and chemist, son of Thomas De la Rue, the founder of the large firm of stationers of that name in London, was born in Guernsey on the 18th of January 1815. Having completed his education in Paris, he entered his father's business, but devoted his leisure hours to chemical and electrical researches, and between 1856 and 1848 published several papers on these subjects. Attracted to astronomy by the influence of James Nasmyth, he constructed in 1850 a 13-in. reflecting telescope, mounted first at Canterbury, later at Cranford, Middlesex, and with its aid executed many drawings of the celestial bodies of singular beauty and fidelity. His chief title to fame, however, is his pioneering work in the application of the art of photography to astronomical research. In 1851 his attention was drawn to a daguerreotype of the moon by G. P. Bond, shown at the great exhibition of that year. Excited to emulation and employing the more rapid wet-plate process, he succeeded before long in obtaining exquisitely defined lunar pictures, which remained unsurpassed until the appearance of the Rutherford photographs in 1865. In 1854 he turned his attention to solar physics, and for the purpose of obtaining a daily photographic representation of the state of the solar surface he devised the photo-heliograph, described in his report to the British Association, "On Celestial Photography in England" (1859), and in his Bakerian Lecture (Phil. Trans., vol. cxx., pp. 331-416). Regular work with this instrument, inaugurated at Kew by De la Rue in 1855, was carried on there for fourteen years; and was continued at the Royal Observatory, Greenwich, from 1873 to 1882. The results obtained in the years 1862—1866 were discussed in two memoirs, entitled "Researches on Solar Physics," published by De la Rue, in conjunction with Professor Balfour Stewart and Mr. B. Loewy, in the Phil. Trans. (vol. clx. pp. 1-110, and vol. clx. pp. 389-496). In 1860 De la Rue took the photo-heliograph to Spain for the purpose of photographing the total solar eclipse which occurred on the 18th of July of that year. This expedition formed the subject of the Bakerian Lecture already referred to. The photographs obtained on that occasion proved beyond doubt the solar character of the prominences or red flames, seen around the limb of the moon during a solar eclipse. In 1875 De la Rue gave up active work in astronomy, and presented most of his astronomical instruments to the university observatory, Oxford. Subsequently, in the year 1887, he provided the same observatory with a 13-in. refractor to enable it to take part in the International Photographic Survey of the Heavens. With Dr. Hugo Müller as his collaborator he published several papers of a chemical character between the years 1856 and 1862, and investigated, 1868—1883, the discharge of electricity through gases by means of a battery of 14,600 chloride of silver cells. He was twice president of the Chemical Society, and also of the Royal Astronomical Society (1864—1866). In 1862 he received the gold medal of the latter society, and in 1864 a Royal medal from the Royal Society, for his observations on the total eclipse of the sun in 1860, and for his improvements in astronomical photography. He died in London on the 19th of April 1889.

DELATOR, in Roman history, properly one who gave notice (deferre) to the treasury officials of moneys that had become due to the imperial fisc. This special meaning was extended to those who lodged information as to punishable offences, and further, to those who brought a public accusation (whether true or not) against any person (especially with the object of getting money). Although the word delator itself, for "common informer," is confined to imperial times, the right of public accusation had long been in existence. When exercised from patriotic and disinterested motives, its effects were beneficial; but the moment the principle of reward was introduced, this was no longer the case. Sometimes the accuser was rewarded with the rights of citizenship, a place in the senate, or a share of the property of the accused. At the end of the republican period, Cicero (De Officiis, ii. 14) expressed the opinion that accusations should be undertaken only in the interests of the state for other urgent reasons. Under the empire the system degenerated into an abuse, which reached its height during the reign of Tiberius, although the delators continued to exercise their activity till the reign of Theodosius. They were drawn from all classes of society,—
patricians, knights, freedmen, slaves, philosophers, literary men, and, above all, lawyers. The objects of their attacks were the wealthy, all possible rivals of the emperor, and those whose conduct implied a reproach against the imperial mode of life. Special opportunities were afforded by the law of majestas, which (originally directed against attacks on the ruler by word or deed) came to include all kinds of accusations with which it really had nothing to do; indeed, according to Tacitus, a charge of treason was regularly added to all criminal charges. The chief motive for these accusations was no doubt the desire of amassing wealth, since by the law of majestas one-fourth of the goods of the accused, even if he committed suicide in order to avoid confiscation (which was always carried out in the case of those condemned to capital punishment), was assured to the accuser (who was henceforth called quadruplatror. Pliny and Martial mention instances of enormous fortunes amassed by those who carried on this hateful calling. But it was not without its dangers. If the defato lost his case or refused to carry it through, he was liable to the same penalties as the accused; he was exposed to the risk of vengeance at the hands of the proscribed in the event of their return, or of their relatives; while emperors like Tiberius would have no scruples about banishing or putting out of the way those of his creatures for whom he had no further use, and who were the evidence of the quattuorcentists. As against this, the emperors a reaction set in, and the severest penalties were inflicted upon the defato. Titus drove into exile or reduced to slavery those who had served Nero, after they had first been flogged in the amphitheatre. The abuse naturally reappeared under a man like Domitian; the defato, with whom Vespasian had not interfered, although he had abolished trials for majestas, were again banished by Trajan, and threatened with capital punishment in an edict of Constantine; but, as has been said, the evil, which was an almost necessary accompaniment of autocracy, lasted till the end of the 4th century.

**DELAUNAY, ÉLISÉ** (1828–1891), French painter, was born at Nantes and studied under Flandrin and at the École des Beaux Arts. He worked in the classicist manner of Ingres until, after winning the Prix de Rome, he went to Italy in 1856, and abandoned the ideal of Raphaelian perfection for the verity and truth of the quattrocentists. As a draughtsman he stands second only to Ingres. After his return from Rome he was entrusted with many important commissions for decorative paintings, such as the frescoes in the church of St Nicholas at Nantes; the three panels of "Apollo," "Orpheus" and "Amphion" at the Paris opera-house; and twelve paintings for the great hall of the council of state in the Palais Royal. His "Scenes from the Life of St Geneviève," which he designed for the Pantheon, remained unfinished at his death. The Luxembourg Museum has his famous "Plague in Rome" and a nude figure of "Diana;" and the Nantes Museum, the "Lesson on the Flute." In the last decade of his life he achieved great popularity as a portrait painter.

**DELAUNAY, LOUIS ARSENE** (1826–1903), French actor, was born in Paris, the son of a wine-seller. He studied at the Conservatoire, and made his first formal appearance on the stage in 1845, in *Tartuffe* at the Odéon. After three years at this house he made his début at the Comédie Française as Dorante in Corneille's *Le Menteur,* and began a long and brilliant career in which he continued for thirty-seven years. He was sixty, his grace, marvellous diction and passion enchanting his audinence. It was especially in the plays of Alfred de Musset that he found his happiest expression. In the thirty-seven years during which he was a member of the Comédie Française, Delannay took or created nearly two hundred parts. He retired in 1887, having been a chevalier of the Legion of Honour in 1853.

"Delatores, genus hominum publico exitio repertum... per oraeemia elicebantur" (Tacitus, *Annals*, iv. 30).

**DELAUNAY—DELAVIGNE**

**DELAUNAY, JEAN FRANÇOIS CASIMIR** (1793–1843), French poet and dramatist, was born on the 4th of April 1793 at Havre. His father sent him at an early age to Paris, there to be educated at the Lycée Napoléon. Constitutionally of an ardent and sympathetic temperament, he enlarged his outlook by extensive miscellaneous reading. On the 20th of March 1811 the empress Marie Louise gave birth to a son, named in his very cradle king of Rome. This event was celebrated by Delavigne in *Dithyrambe sur la naissance du roi de Rome,* which secured for him a sinecure in the revenue office.

About this time he competed twice for an academy prize, but without success. Delavigne, inspired by the catastrophe of 1815, wrote two impassioned poems, the first entitled *Waterloo,* the second, *Désastre du musée,* both written in the heat of patriotic enthusiasm, and teeming with popular political allusions. A third, but of inferior merit, *Sur le besoin de s'unir après le départ des étrangers,* was afterwards added. These stirring pieces, termed by him *Messéniennes,* sounded a keynote which found an echo in the hearts of all. Twenty-five thousand copies were sold; Delavigne was famous. He was appointed to an honorary librarianship, with no duties to discharge. In 1819 he played *Les vêpres Siciliennes* was performed at the Odéon, then just rebuilt; it had previously been refused for the Théâtre Français. Also in 1819 came the first of the *Monsieur d'Halot,* which was not warmly received, Picard, the manager, threw himself into the arms of his elated friend, exclaiming, "You have saved us! You are the founder of the second French Theatre." This success was followed up by the production of the *Comédiens* (1820), a poor play, with little plot, and the *Paria* (1821), with still less, but containing some well-written choruses. The latter piece obtained a longer lease of life than its intrinsic literary merits warranted, on account of the popularity of the political opinions freely expressed in it—so freely expressed, indeed, that the displeasure of the king was incurred, and Delavigno lost his post. But Louis Philippe, duke of Orleans, willing to gain the people's good wishes by complimenting their favourite, wrote to him as follows: "The thunder has descended on your house; I offer you an apartment in mine." Accordingly Delavigne became librarian at the Palais Royal, a position retained during the remainder of his life. It was here that he wrote the *École des vieillards* (1823), his best comedy, which gained his election to the Academy in 1825. To this period also belong *La Princesse Aurèlie* (1828), and the *Monseigneur de France* in the romantic style.

For his success as a writer Delavigne was in no small measure indebted to the stirring nature of the times in which he lived. The *Messéniennes,* which first introduced him to universal notice, had their origin in the excitement consequent on the occupation of France by the allies in 1815. Another crisis in his life and in the history of his country, the revolution of 1830, stimulated him to the production of a second masterpiece, *La Parisienne.* This song, set to music by Aubert, was on the lips of every Frenchman, and rivalled in popularity the *Marseillaise.* A companion piece, *La Varsovie,* was written for the Poles, by whom it was sung on the march to battle. Other works of Delavigne followed each other in rapid succession—*Louis XI* (1832), *Les Enfants Edouard* (1833), *Don Juan d'Autriche* (1835), *Une Famille au temps du Luther* (1836), *La Popularité* (1838), *La Pille du Cid* (1839), *Le Conseiller rapporteur* (1840), and *Charles VI* (1843), an opera partly written by his brother. In 1843 he quitted Paris to seek in Italy the health his labours had cost him. At Lyons his strength altogether gave way, and he died on the 11th of December.

But many of his poems were left unfinished, and after his death Delavigne was looked upon as unsurpassed and unsurpassable. Every one bought and read his works. But the applause of the moment was gained at the sacrifice of lasting fame. As a writer he had many excellences. He expressed himself in a terse and vigorous style. The poet of reason rather than of imagination, he recognized his own province, and was rarely tempted to flights of fancy beyond his powers. He wrote always as he would have spoken, from sincere conviction. In private life he was in every way estimable,—upright, amiable, devoid of all jealousy, and generous to a fault.
His Poésies and his Théâtre were published in 1863. His Œuvres complètes (new edition, 1855) contains a biographical notice by his brother, Germain Delavigne, who is best known as a librettist in opera. See also Sainte-Beuve, Portraits littéraires, vol. v.; A. Fayvrot, Étude sur Casimir Delavigne (1894); and F. Vuauchez, Casimir Delavigne (1893).

DELAWARE, a South Atlantic state of the United States of America, one of the thirteen original states, situated between 38° 27' and 35° 50' N. lat. and between 75° 2' and 75° 47' W. long. (For map see Maryland.) It is bounded N. and N.W. by Pennsylvania, E. by the Delaware river and Delaware Bay, which separate it from New Jersey, and by the Atlantic Ocean; S. and W. by Maryland. With the exception of Rhode Island it is the smallest state in the Union, its area being 2370 sq. m., of which 455 sq. m. are water surface.

Physical Features.—Delaware lies on the Atlantic coastal plain, and is for the most part level and relatively low, its average elevation above the sea being about 50 ft. It is situated in the eastern part of the peninsula formed by Chesapeake Bay and the estuary of the Delaware river. In the extreme N. the country is rolling, with moderately high hills, moderately deep valleys and rapid streams. West of Wilmington there rises a ridge which crosses the state in a north-westerly direction and forms a watershed between Christiana and Brandywine creeks, its highest elevation above sea-level being 280 ft. South of the Christiana there begins another elevation, sandy and marshy, which extends almost the entire length of the state from N.W. to S.E., and forms a second water-parting. The streams that drain the state are small and insignificant. Those of the N. flow into Brandywine and Christiana creeks, whose estuary into Delaware river forms Wilmington harbour; those of the S.W. have a common outlet in the Nanticoke river of Maryland; those of the E. empty into Delaware Bay and the Atlantic Ocean. The principal harbours are those of Wilmington, New Castle and Lewes. The shore of the bay is marshy, that of the Atlantic is sandy. In Kent county there are more than 60,000 acres of tidal marshland, some of which has been reclaimed by means of dykes; Cypress Swamp in the extreme S. has an area of 50,000 acres. The soils of the N. are clays, sometimes mixed with loam; those of the central part are mainly loams; while those of the S. are sands.

Minerals are found only in the N. part of the state. Those of economic value are kaolin, mined chiefly in the vicinity of Hockessin, New Castle county, the static kaolin product being exceeded in 1903 only by that of Pennsylvania among the states of the United States; granite, used for road-making and rough construction; found near Wilmington; and brick and tile clays; but the value of their total product in 1902 was less than $250,000. In 1906 the total mineral product was valued at $814,126, of which $237,768 represented clay products and $146,346 stone. In 1902 only 2-2% of the wage-earners were engaged in mining.

The forests, which once afforded excellent timber, including white oak for shipbuilding, have been greatly reduced by constant cutting; in 1900 it was estimated that 700 sq. m. were wooded, but practically none of this wood was of commercial importance. Of the hardwoods, sturgeon and shad, yield an annual product valued at about $250,000.

The proximity of the Delaware and Chesapeake bays help to give Delaware a mild and temperate climate. The mean annual temperature is approximately 55° F., ranging from 52° in the S. to 56° in the N., and the extremes of heat and cold are 105° in the summer and -17° in the winter. The annual rainfall, greater on the coast than inland, ranges from 40 to 45 in.

Industry and Trade.—Delaware is pre-eminent an agricultural state. In 1900 85% of its total land surface was enclosed in farms—a slight decline since 1880. Seven-tenths of this was improved land, and the expenditure per farm for fertilizers, greater in 1890 than the average of the Atlantic states, approximated $55 per farm in 1900. In 1890 Delaware spent more per acre for fertilizers than any of the other states except New Jersey, Rhode Island and Maryland. The average size of farms, as in the other states, has declined, falling from 124-6 acres in 1880 to 110-1 acres in 1900. A large proportion of farms (49-7%) were operated by the owners, and the prevailing form of tenancy was the share system by which 42-5% of the farms were operated by negroes; these represented less than 4% of the total value of farm property. The average value of farms operated by negroes being $17 per acre, that of farms operated by whites, $23 per acre. The total value of farm products in 1900 was $9,100,777, an increase of 30% over that of 1890, while the cultivation of cereals suffered on account of the competition of the western states. Indian corn and wheat form the two largest crops, their product in 1900 being respectively 24% and 52% greater than in 1890; but these crops when compared with those of other states are relatively unimportant. In 1906 the acreage of Indian corn was 106,472 acres with a yield of 8,904,169 bushels valued at $2,475,547, and the acreage of wheat was 121,745 acres with a yield of 1,047,920 bushels valued at $1,583,023. The value of the fruit crop, for which Delaware has long been noted, also increased during the same decade, but disease and frost caused a marked decline in the production of peaches, a loss balanced by an increased production of apples, pears and other orchard fruits. Large quantities of small fruits, particularly of strawbery, raspberries and blackberries, are produced, the southern portion of Sussex county being particularly favourable for strawberry culture. The vicissitudes of fruit raising have also caused increasing attention to be paid to market gardening, dairying and stock raising, particularly to market gardening, an industry which is favoured by the proximity of large cities. The same influence explains, partly at least, the decrease (of 13%) in the value of farm property between 1890 and 1900.

The development of manufacturing in Delaware has not been so extensive as its favourable situation relative to the other states, the facilities for water and railway transportation, and the proximity of the coal and iron fields of Pennsylvania, would seem to warrant. In 1905 the wage-earners engaged in manufacturing (under the factory system) numbered 18,475, and the total capital invested in manufacturing was $50,025,630; the gross value of products was $41,166,276; the net value (deducing the value of material purchased in partly manufactured form) was $26,756,476. The principal industry was the manufacture of iron and steel products, which, including steel and rolling mills, car, foundry and machine shops, and shipyards, represented more than 30% of the total capital, and approximately 25% of the total gross product of the manufactures in the state. The tanning, currying and finishing of leather ranks second in importance, with a gross product ($10,250,842) 9% greater than that of 1900, and constituting about one-fourth of the gross factory product of the state in 1905; and the manufacture of food products ranked third, the value of the products of the fruit canning and preserving industry having more than doubled in the decade 1890-1900, but falling off a little more than 7% in 1900-1905. The manufacture of paper and wood pulp showed an increased product in 1905 19-1% greater than in 1900; and flour and grist mill products were valued in 1905 43-6% higher than in 1900. In the grand total of manufactured products, however, the state of 1905 showed a 9-4% increase of 4% from 1900. The great manufacturing centre is Wilmington; in 1905 almost two-thirds of the capital was invested, and nearly three-fourths of the product was turned out. There is much manufacturing also at New Castle.

Delaware has good facilities for transportation. Its railway mileage in January 1907 was 333-6 m.; the Philadelphia, Baltimore & Washington (Pennsylvania system), the Baltimore & Philadelphia (Baltimore & Ohio system), and the Wilmington & Northern (Philadelphia & Reading system) cross the northern part of the state, while the Delaware railway (leased by the Philadelphia, Baltimore & Washington) runs the length of the state below Wilmington, and another line, the Maryland, Delaware & Virginia (controlled by the Baltimore, Chesapeake & Atlantic railway, which is related to the Pennsylvania system), connects Lewes, Del., with Love Point, Md., on the Chesapeake Bay. There is no state railway commission, and the farmers of southern Delaware have suffered from excessive freight rates.
The Delaware & Chesapeake Canal (13½ m. long, 66 ft. wide and 10 ft. deep) crosses the N. part of the state, connecting Delaware river and Chesapeake Bay, and thus affords transportation by water from Baltimore to Philadelphia. The canal was completed in 1829; in 1907 a commission appointed by the president to report on a route for a waterway between Chesapeake and Delaware bays selected the route of this canal. The states of Maryland and Delaware aided in its construction, and in 1828 the national government also made an appropriation. Wilmington is a customs district in which New Castle and Lewes are included; but its trade is largely coastwise. Rehoboth and Indian River bays are navigable for vessels of less than 6 ft. draft. Opposite Lewes is the Delaware Breakwater (begun in 1818 and completed in 1869, at a cost of more than $2,000,000), which forms a harbour 16 ft. deep. In 1897-1901 the United States government constructed a harbour of refuge, formed by a second breakwater 2½ m. N. of the existing one; its protected anchorage is 552 acres and the cost was more than $3,090,000. The harbour is about equidistant from New York, Philadelphia, and the capes of Chesapeake Bay, and is used chiefly by vessels awaiting orders to ports for discharge or landing. The national government also made appropriations for opening an inland waterway from the Delaware River to the Chesapeake Bay, Virginia, for improving Wilmington harbour, and for making navigable several of the larger streams of the state.

Population. — The population in 1880 was 146,908; in 1890, 168,493, an increase of 14.9%; in 1900, 184,725, a further increase of 9.6%; in 1910, 202,322. The rate of increase before 1850 was considerably smaller than the rate after that date. Of the population in 1900, 92.5% was native born and 7.5% was foreign-born. The negro population was 30,697, or 16.6% of the total. In Indian River Hundred, Sussex county, there formerly lived a community of people,—many of whom are of the fair Caucasian type,—called "Indians" or "Moors"; they are now quite generally dispersed throughout the state, especially in Kent and Sussex counties. Their origin is unknown, but according to local tradition they are the descendants of some Moorish sailors who were cast ashore many years ago in a shipwreck; their own tradition is that they are descended from the children of an Irish mother and a negro father, these children having intermarried with Indians of the Nanticoke tribe. They have, until recently, continued to make their living by the gathering of sea-girt, which was for many years a staple, and in the meantime receiving state aid. The urban population of Delaware (i.e. of Wilmington, the only city having more than 5000 inhabitants) was, in 1900, 41.4% of the state's population. There were thirty-five incorporated cities and towns. The largest of these was the city of Wilmington, with 76,508 inhabitants. The city next in size, New Castle, had a population of 35,808, while the largest town, Dover, the capital of the state, had 3,320. The total number of communicants of all denominations in 1906 was 71,251,—32,402 Methodists, 24,228 Roman Catholics, 5,200 Presbyterians, 3,706 Protestant Episcopalians, and 3,021 Baptists.

Government. — The constitution by which Delaware is governed was adopted in 1807. Like the previous constitutions of 1776, 1792 and 1831, it was promulgated by a constitutional convention without submission to the people for ratification, and amendments may be adopted by a two-thirds vote of each house in two consecutive legislative sessions. Its character is distinctly democratic. The property qualification of state senators and the number of suffrage to those who have paid county or poll taxes are abolished; but suffrage is limited to male adults who can read the state constitution in English, and can write their names, unless physically disqualified, and who have registered. In 1907 an amendment to the constitution was adopted, which struck out from the instrument the clause requiring the payment of a registration fee of one dollar by each elector. Important innovations in the constitution of 1807 are the office of lieutenant-governor, and the veto power of the governor which may extend to parts and clauses of appropriation bills, but a bill may be passed over his veto by a three-fifths vote of each house of the legislature, and a bill becomes a law if not returned to the legislature within ten days after its reception by the governor, unless the session of the legislature shall have expired in the meantime. The governor's regular term in office is four years, and he is ineligible for a third term. All his appointments to offices where the salary is more than $300 must be confirmed by the senate; all pardons must be approved by a board of pardons. Representation in the legislature is according to districts, members of the lower house being chosen for two, and members of the upper house for four years. Members of the lower house must be at least twenty-four years of age, members of the senate at least twenty-seven; members of both houses must at the time of their election have been citizens of the state for at least three years. In November 1906 the people of the state voted (17,248 for; 2162 against) in favour of the provision of a system of advisory initiative and advisory referendum; and in March 1907 the general assembly passed an act providing initiative and referendum in the municipal affairs in the city of Wilmington. The organization of the judiciary is similar to that under the old English system. Six judges—a chancellor, a chief justice, and four associate justices—of whom there shall be at least one resident in each of the three counties, and not more than two shall belong to the same political party, are appointed by the governor, with the consent of the senate, for a term of twelve years. They hold courts of chancery, general sessions, oyer and terminer, and an orphans' court; six together constitute the supreme court, but the judge from whose decision appeal is made may not hear the appealed case unless the appeal is made at his own instance. Bribery may be punished by fine, imprisonment and disfranchisement for ten years. Corporations cannot be created by a special act of the legislature, and no corporation may issue stock except for an equivalent value of money, labour or property. In order to attract capital to the state, the legislature has reduced the taxes on corporations, has forbidden the repeal of charters, and has given permission for the organization of corporations with both the power and name of trust companies. Legislative divorces are forbidden by the constitution, and a statute of 1901 subjects wife-beaters to corporal punishment. Although punishment by whipping and by standing in the pillory was prohibited by an act of Congress in 1839, in so far as the Federal government had jurisdiction, both these forms of punishment were retained in Delaware, and standing in the pillory was prescribed by statute until 1864. The law prescribed the whipping of men for offenses punishable by corporal punishment, and for specific offenses, including various kinds of larceny and forgery, highway robbery, and even pretending "to exercise the art of witchcraft, fortune-telling or dealing with spirits," at least until 1853. In 1905, by a law approved on the 20th of March, the pillory was abolished. The whipping-post was in 1908 still maintained in Delaware, and whipping continued to be prescribed as a punishment for a variety of offences, although in 1889 a law was passed which prescribed that "hereafter no female convicted of any crime in this state shall be whipped or made to stand in the pillory," and a law passed in 1883 prescribed that "in case of conviction of larceny, when the prisoner is of tender years, or is charged for the first time (being shown to have before had a good character), the court may in its discretion omit from the sentence the infliction of lashes." An old law still on the statute-books when the edition of the revised statutes was issued in 1893, prescribes that "the punishment of whipping shall be inflicted publicly by strokes on the bare back, well laid on." The unit of local government is the "hundred," which corresponds to the township of Pennsylvania. The employment of children under fourteen years of age in factories is forbidden by statute. Divorces are granted for adultery, desertion for three years, habitual drunkenness, impotence at the time of marriage, fraud, lack of marriageable age (eighteen for males, sixteen for females), and failure of husband to provide for his wife during three consecutive years. The marriages of whites with negroes and of insane persons are null; but the children of the married insane are legitimate.

In 1908 the state debt was $816,785, and the assets in bonds, railway mortgages and bank stocks exceeded the liabilities by $717,779. Besides the income from interest and dividends
on investments, the state revenues are derived from taxes on
licences, on commissions to public officers, on railway, telegraph
and telephone, express, and banking companies, and to a slight
extent from taxes on collateral inheritance.

Education.—The charitable and penal administration of
Delaware is not well developed. There is a state hospital for
the insane at Farnhurst. Other dependent citizens are cared for
in the institutions of other states at public expense. In 1899
a county workhouse was established in New Castle county, in
which persons under sentence must labour eight hours a day, pay
being allowed for extra hours, and a diminution of sentence for
good behaviour. At Wilmington is the Ferris industrial school
for boys, a private reformatory institution to which New Castle
county gives $146 for each boy; and the Delaware industrial
school for girls, also at Wilmington, receives financial support
from both county and state.

The educational system of the state has been considerably
improved within recent years. The maintenance of a system of
public schools is rendered compulsory by the state constitution,
and a new compulsory school law came into effect in 1907.
The first public school law, passed in 1833, was based largely on
the principle of "local option," each school district being left free
to determine the character of its own school or even to decide,
if it wished, against having any school at all. The system thus
established proved to be very unsatisfactory, and a new school
law in 1875 brought about a greater degree of uniformity
and centralization through its provisions for the appointment of
a state superintendent of free schools and a state board of
education. In 1888, however, the state superintendency was
abolished, and county superintendencies were created instead,
the legislature thus returning, in a measure, to the old system
of local control. Centralization was again secured, in 1898, by the
passage of a law reorganizing and increasing the powers of the
state board of education. The state school fund, ranging from
about $150,000 to $100,000 a year, is apportioned among the
school districts, according to the number of teachers employed,
and is used exclusively for teachers' salaries and the supplying of
free text-books. This fund is supplemented by local taxation.
No discrimination is allowed on account of race or colour; but
separate schools are provided for white and coloured children.

Delaware College (non-sectarian) at Newark, founded in 1833 as
Newark College and rechartered, after suspension from 1859 to
1870, under the present name, as a state institution, derives
most of its financial support from the United States Land Grant
of 1862 and the supplementary appropriation of 1890, and is the
seat of an agricultural experiment station, established in
1888 under the so-called "Hatch Bill" of 1887. In 1906-1907
Delaware College had 20 instructors and 130 students.
The college is a part of the free school system of Delaware, and tuition
is free to all students from the state. There is an agricultural
college for negroes at Dover; this college receives one-fifth of
the appropriation made by the so-called "new Morrill Bill" of
1890.

History.—Delaware river and bay were first explored on behalf
of the Dutch by Henry Hudson in 1609, and more thoroughly
in 1615-1616 by Cornelius Hendrikson, whose reports did much
to cause the incorporation of the Dutch West India Company.
The first settlement on Delaware soil was made under the auspices
of members of this company in 1631 near the site of the present
Lewes. The leaders, one of whom was Captain David P. de Vries,
wished "to plant a colony for the cultivation of grain and tobacco
as well as to carry on the whale fishery in that region." The
settlement, however, was soon completely destroyed by the Indians.

(See Lewes.) A more successful effort at colonization was made
under the auspices of the South Company of Sweden, a
corporation organized in 1624 as the "Australian Company,"
by William Usselinx, who had also been the chief organizer of
the Dutch West India Company, and now secured a charter
or manifest from Gustavus Adolphus. The privileges of the
company were extended to Germans in 1633, and about 1640
the Dutch members were bought out. In 1658 Peter Minuit on
behalf of this company established a settlement at what is now
Wilmington, naming it, in honour of the infant queen Christina,
Christina, and naming the entire territory, bought by Minuit
from the Minquas Indians and extending indefinitely westward
from the Delaware river between Bombay Hook and the mouth
of the Schuylkill river, "New Sweden." This territory was
subsequently considerably enlarged. In 1642 mature plans for
colonization were adopted. A new company, officially known
as the West India, American, or New Sweden Company, but like
its predecessor popularly known as the South Company, was
chartered, and a governor, Johan Printz (c. 1600-1663) was sent
out by the crown. He arrived early in 1643 and subsequently
established settlements on the island of Tinicum, near the present
Chester, Pennsylvania, at the mouth of Salem Creek, New Jersey,
and near the mouth of the Schuylkill river. Friction had soon
arisen with New Netherland, although, owing to their common
dislike of the English, the Swedes and the Dutch had main-
tained a formal friendship. In 1651, however, Peter Stuyvesant,
governor of New Netherland, and more aggressive than his pre-
decessors, built Fort Casimir, near what is now New Castle.
In 1654 Printz's successor, Johan Claudius Rising, who had
established the first settlement at Tinicum with a large number of colonists, had
hopelessly bad relations with the Dutch and was expelled from
the Dutch from Fort Casimir. In retaliation, Stuyvesant, in
1655, with seven vessels and as many hundred men, recaptured
the fort and also captured Fort Christina (Wilmington). New
Sweden thus passed into the control of the Dutch, and became
a dependency of New Netherland. In 1656, however, the Dutch
West India Company sold part of what had been New Sweden to
the city of Amsterdam, which in the following year established a
settlement called "New Amstel" at Fort Casimir (New Castle).
This settlement was badly administered and made little progress.

In 1663 the whole of the Delaware country came under the
jurisdiction of the city of Amsterdam, but in the following year
this territory, with New Netherland, was seized by the English.
For a brief interval, in 1673-1674, the Dutch were again in control,
but in the latter year, by the treaty of Westminster, the "three
counties on the Delaware" again became part of the English
possessions in America held by the duke of York, later James II.
His formal grant from Charles II. was not received until March
1683. In order that no other settlements should encroach upon
his centre of government, New Castle, the northern boundary was
determined by drawing an arc of a circle, 12 m. in radius, and
with New Castle as the centre. This accounts for the present
curved boundary line between Delaware and Pennsylvania.
Previously, however, in August 1680, the duke of York had
leased this territory for 10,000 years to William Penn, to whom
he conveyed it by a deed of feoffment in August 1682; but
differences in race and religion, economic rivalry between New
Castle and the Pennsylvania towns, and petty political quarrels
over representation and office holding, similar to those in the
other American colonies, were so intense that Penn in 1691
appointed a special deputy governor for the "lower counties.
Although reunited with the "province" of Pennsylvania in
1693, the so-called "territories" or "lower counties" secured a
separate legislature in 1704, and a separate executive council in
1719; the governor of Pennsylvania, however, was the chief
executive until 1776. A protracted boundary dispute with Mary-
land, which colony at first claimed the whole of Delaware under
the charter of its predecessor, Maryland's charter, was not settled until 1767, when the
present line separating Delaware and Maryland was adopted.
In the War of Independence Delaware furnished only one
regiment to the American army, but that was one of the best in
the service. One of its companies carried a number of game-
cocks said to have been the brood of a blue hen; hence the
soldiers, and later the people of the state, have been popularly
known as the "Blue Hen's Chickens."

In 1776 a state government was organized, representative of
the Delaware state, the term "State of Delaware" being first
adopted in the constitution of 1792. One of the peculiarities of
the government was that in addition to the regular executive,
legislative and judicial departments there was a privy council
without whose approval the governor's power was little more
than nominal. In 1786 Delaware was one of the five states

DELAWARE

949
whose delegates attended the Annapolis Convention (see Annapolis, Maryland), and it was the first (on the 7th of December 1782) to ratify the Federal constitution. From then until 1850 it was controlled by the Federalist or Whig parties. In 1850 the Democrats, who had before then elected a few governors and United States senators, secured control of the entire administration—a control unarrested, except in 1863, until the last decade of the 19th century. Although it was a slave state, the majority of the people of Delaware opposed secession in 1861, and the legislature promptly answered President Lincoln's call to arms; yet, while 14,000 of the 40,000 males between the ages of fourteen and sixty served in the Union army, there were many sympathizers with the Confederacy in the southern part of the state. In 1866, 1867 and 1869, respectively, the legislature refused to ratify the thirteenth, fourteenth and fifteenth amendments to the Federal constitution. The provision of the state constitution that restricted suffrage to those who had paid county or poll taxes and made the tax lists the basis for the lists of qualified voters, opened the way for the disfranchisement of many negroes by fraudulent means. Consequently the levy court of New Castle county was indicted in the United States circuit court in 1872, and one of its members was convicted. Again in 1880 the circuit court, by virtue of the Federal statute of 1872 on elections, appointed supervisors of elections in Delaware. The negro vote has steadily increased in importance, and in 1900 was approximately one-fifth of the total vote of the state. In 1901 the legislature ratified the three amendments rejected in former years. Another political problem has been that of representation. According to the constitution of 1831 the unit of representation in the legislature was the county; inasmuch as the population of New Castle county has exceeded after 1870 that of both Kent and Sussex, the inequality became a cause of discontent. This is partly eradicated by the new constitution of 1897, which reapportioned representation according to electoral districts, castian continued its seven senators and fifteen representatives, while each of the other counties has seven senators and ten representatives.

In 1889 the Republicans for the first time since the Civil War secured a majority in the legislature, and elected Anthony J. Higgins to the United States Senate. In that year a capitalist and promoter, J. Edward Addicks (b. 1834, in Pennsylvania), became a citizen of the state, and after securing for himself the control of the Wilmington gas supply, systematically set about building up a personal "machine" that would secure his election to the national Senate as a Republican. His purpose was thwarted in 1893, when a Democratic majority chose, for a second term, George Gray (b. 1840), who from 1879 to 1883 had been the attorney-general of the state and subsequently was a member of the Spanish-American Peace Commission at Paris in 1898 and became a judge of the United States circuit court, third judicial circuit, in 1899. Mr Addicks was an avowed candidate in 1895, but the opposition of the regular Republicans did not accuse him of corruption and who held the balance of power, prevented an election. In 1897 the legislature being again Democratic, Richard R. Kenney (b. 1856) was chosen to fill the vacancy for the remainder of the unexpired term. Meanwhile the two Republican factions continued to oppose one another, and both sent delegates to the national party convention in 1896, the "regular" delegation being seated. The expiration of Senator Gray's term in 1899 left a vacancy, but although the Republicans again had a clear majority the resolution of the regulars prevented the Union Republicans, as the supporters of Addicks called themselves, from seating their patron. Both the regular and Union factions sent delegations to the national party convention in 1900, where the refusal of the regulars to compromise led to the recognition of the Union delegates. Despite this apparent abandonment of their cause by the national organization, the regulars continued their opposition, the state being wholly without representation in the Senate from the expiration of Senator Kenney's term in 1901 until 1903, when a compromise was effected whereby two Republicans, one of each faction, were chosen, one condition being that Addicks should not be the candidate of the Union Republicans. Both factions were recognized by the national convention of 1904, but the legislature of 1905 adjourned without being able to fill a vacancy in the Senate which had again occurred. The deadlock, however, was broken at the special session of the legislature called in 1906, and in June of that year Henry A. Du Pont was elected senator.

Speaker of the Senate—Filled unexpired term of Gunning Bedford (d. 1797).

1 Speaker of the senate. Filled unexpired term of Richard Bassett, who resigned 1861.

2 Died before he was inaugurated.

3 Speaker of the senate, John Collins dying in 1862.

4 Speaker of the senate, John Bassett dying in 1822.

5 Speaker of the senate, Haslett dying in 1835.

6 Speaker of the senate, Gabriel dying in 1828.

7 Speaker of the senate, Stockton dying in 1846.

8 Speaker of the senate, Maul dying in 1836.

9 As speaker of the senate filled the unexpired term of Cannon (d. 1862), and then became governor in 1867.

10 President of the senate, Marvil dying in 1845.
DELAWARE—DELAWARE WATER-GAP

BIBLIOGRAPHY.—Information about manufactures, mining and agriculture may be found in the reports of the Twelfth Census of the United States, especially Bulletins 69 and 100. The Agricultural Experiment Station, at Newark, publishes in its Annual Report a record of temperature and rainfall. For law and administration in Delaware see the Revised Code of 1852, amended 1893 (Wilmington, 1893). For education see L. B. Powell, History of Education in Delaware (Washington, 1893), and a sketch in the Annual Report for 1902 of the United States Commissioner of Education. A sketch of education in Delaware is to be found in Bulletin of the Bureau of Education, vol. 12, by A. N. Hudson. A similar account of the condition of schools in Delaware is that of John Thomas Scharf, History of the State of Delaware (2 vols., Philadelphia, 1888); the second volume is entirely biographical. Claes T. Oidhner's brief sketch, Kolonien Nya Sveriges Grundsättningar, 1637-1642 (Stockholm, 1891) contains translations of the Swedish Historical and Biographical, vol. iii., and Carl K. S. Sprinchorn's Kolonien Nya Sveriges Historia (1878; English translation in the Pennsylvania Magazine of History and Biography, vols. vii. and viii.) are based, in particular, on documents preserved in the Royal Archives at Upsala and Lund, which were unknown to Benjamin Ferris (History of the Original Settlements of the Delaware, Wilmington, 1846) and Francis Vincent (History of the State of Delaware, Philadelphia, 1873), which ends with the English occupation in 1664. In vol. iv. of Justin Winsor's Narrative and Critical History of America (Boston, 1884) there is an excellent chapter by Gregory B. Keen on "New Sweden, or the Swedes on the Delaware," to which a bibliographical chapter is appended. These sources of information contain valuable material. In part ii. of the Report of the Superintendent of the U.S. Coast and Geodetic Survey for 1893 (Washington, 1906) there is "An Historical Account of the Boundary Line between the States of New York and Pennsylvania, by J. B. Thompson." The colonial records are preserved with those of New York and Pennsylvania; only one volume of the State Records has been published, and Minutes of the Council of Delaware State, 1770-1792 (Dover, 1806). For a civil War local history, the Civil War see vol. 141 of the North American Review, vol. 32 of the Forum, and vol. 73 of the Outlook—all published in New York.

DELAWARE, a city and the county-seat of Delaware county, Ohio, U.S.A., on the Olantagy (or Whetstone) river, near the centre of the state. Pop. (1890) 8224; (1900) 7940 (572 being foreign-born and 432 negroes); (1910) 9076. Delaware is served by the Pennsylvania, the Cleveland, Cincinnati, Chicago & St Louis (New York Central system), and the Hocking Valley railways, and by two interurban lines. The city is built on rolling ground about 900 ft. above sea-level. There are many sulphur and iron springs in the vicinity. Delaware is the seat of the Ohio Wesleyan University (coeducational), founded by the Ohio Watchman, the Methodist Episcopal Church in 1841, and opened as a college in 1844; it includes a college of liberal arts (1844), an academic department (1841), a school of music (1877), a school of fine arts (1875), a school of oratory (1874), a business school (1895), and a college of medicine (the Cleveland College of Physicians and Surgeons, at Cleveland, Ohio; founded as the Charity Hospital Medical College in 1863, and the medical department of the university of Wooster until 1896, when, under its present name, it became a part of Ohio Wesleyan University). In 1877 the Ohio Wesleyan female college, established at Delaware in 1853, was incorporated in the university. In 1909-1908 the university had 122 instructors, 1178 students and a library of 55,395 volumes. At Delaware, also, are the state industrial school for girls, a Carnegie library, the Edwards Young Men's Christian Association building and a city hospital. The city has railway shops and foundries, and manufactures furniture, carriages, tile, cigars and gas engines. Delaware was laid out in 1808 and was first incorporated in 1815. It was the birthplace of Rutherford B. Hayes, president of the United States from 1877 to 1881.

DELAWARE INDIANS, the English name for the Leni Lenape, a tribe of North American Indians of Algonquian stock. When first discovered by the whites the tribe was settled on the banks of the Delaware river. The French called them Loups (wolves) from their chief totemic division. Early in the 17th century the Dutch began trading with them. Subsequently William Penn bought large tracts of land from them, and war followed, the Delawares alleging they had been defrauded; but, with the assistance of the Six Nations, the whites forced them back west of the Alleghenies. In 1780 they were placed on a reservation in Ohio and subsequently in 1818 were moved to Missouri. Various removals followed, until in 1866 they accepted lands in the Indian territory (Oklahoma) and gave up the tribal relation. They have remained there and now number some 1200.

DELAWARE RIVER, a stream of the Atlantic slope of the United States, meeting tide-water at Trenton, New Jersey, 130 m. above its mouth. Its total length, from the head of the longest branch to the capes, is 410 m., and above the head of the bay its length is 360 m. It constitutes in part the boundary between Pennsylvania and New York, the boundary between New Jersey and Pennsylvania, and, for a few miles, the boundary between Delaware and New Jersey. The main, west or Mohawk branch rises in Schoharie county, N.Y., about 1886 ft. above the sea, and flows tortuously through the plateau in a deep trough until it emerges from the Catskills. Other branches rise in Greene and Delaware counties. In the upper portion of its course the varied scenery of its hilly and wooded banks is exquisitely beautiful. After leaving the mountains and plateau, the river flows down broad Appalachian valleys, skirts the Kittatinny range, which it crosses at Delaware Water-Gap, between nearly vertical walls of sandstone, and passes through a quiet and charming country of farm and forest, diversified with plateaus and estuaries, until it crosses the Appalachian plain and enters the hills again at Easton, Pa. From this point it is flanked at intervals by fine hills, and in places by cliffs, of which the finest are the Hockamixon Rocks, 3 m. long and above 200 ft. high. At Trenton there is a fall of 8 ft. Below Trenton the river becomes a broad, sluggish inlet of the sea, with many marshes along its side, widening steadily into its great estuary, Delaware Bay. Its main tributaries in New York are Mongaup and Neversink rivers and Crolicoone Creek; from Pennsylvania, Lackawaxen, Lehigh and Schuykill rivers; and from New Jersey, Rancocas Creek and Musconetcong and Maurice rivers. Commerce was once important on the upper river, but only before the beginning of railway competition (1857). The Delaware division of the Pennsylvania Canal, running parallel with the river from Easton to Bristol, was opened in 1830. A canal from Trenton to New Brunswick unites the waters of the Delaware and Raritan rivers; the Morris and the Delaware and Hudson canals connect the Delaware and Hudson rivers; and the Delaware and Chesapeake canal joins the waters of the Delaware with those of the Chesapeake Bay. The mean tides below Philadelphia are about 6 ft. The magnitude of the commerce of Philadelphia has made the improvements of the river below that port of great importance. Small improvements were attempted by Pennsylvania as early as 1771, but apparently never by New Jersey. The ice floods at Easton are normally 10 to 20 ft., and in 1841 attained a height of 35 ft. These floods constitute a serious difficulty in the improvement of the lower river. In the "project of 1885" the United States government undertook systematically the formation of a 26-ft. channel 600 ft. wide from Philadelphia to deep water in Delaware Bay; $1,532,688-81 was expended—about $200,000 of that amount for maintenance—before the 1885 project was superseded by a paragraph of the River and Harbor Act of the 3rd of March 1899, which provided for a 30-ft. channel 600 ft. wide from Philadelphia to the deep water of the bay. In 1899 the project of 1885 had been completed except for three shoal stretches, whose total length, measured on the range lines, was 48 m. The project of 1899, which cost $8,389,000, was not completed at the close of the fiscal year (June 30, 1900); and $8,492,530-63 had been expended by the Federal government on the work; in 1905 the state of Pennsylvania appropriated $750,000 for improvement of the river in Pennsylvania, south of Philadelphia.

DELAWARE WATER-GAP, a borough and summer resort of Monroe county, Pennsylvania, U.S.A., on the Delaware river, about 108 m. N. of Philadelphia and about 88 m. W. by N. of New York. Pop. (1890) 407; (1900) 469. It is served by the Delaware, Lackawanna & Western, and by the Beltline division of the Pennsylvania railways; along the river on the opposite side (in New Jersey) runs the New York, Susquehanna & Western railway, and the borough is connected with Stroudsburg, Pa. (about 3 m. W. by N.), by an electric line. The borough
DE LA WARR, or DELWARRE, an English barony, the holders of which are descended from Roger de la Warr of Isfield, Sussex, who was summoned to parliament as a baron in 1299 and the following years. He died about 1320; his great-grandson Roger, to whom the French king John surrendered at the battle of Poitiers, died in 1370; and the male line of the family became extinct on the death of Thomas, 5th baron, in 1456.

The 5th baron's half-sister Joan married Thomas West, 1st Lord West (d. 1495), and in 1415 her second son Reginald (1394-1451) succeeded his brother Thomas as 3rd Lord West. After the death of his uncle Thomas, 5th Bar. De L. W., whose estates he inherited, Reginald was summoned to parliament as Baron La Warr, and he is thus the second founder of the family. His grandson was Thomas, 3rd (or 8th) baron (d. 1523), a courtier during the reigns of Henry VII. and Henry VIII., and the latter's son was Thomas, 4th (or 9th) baron (c. 1472-1554). The younger Thomas was a very prominent person during the reigns of Henry VIII. and Edward VI. After serving with the English army in France in 1513 and being present at the Field of the Cloth of Gold, he rebuilt the house at Halnaker in Sussex, which he had obtained by marriage, and here in 1526 he entertained Henry VIII. “with great cheer.” He disliked the ecclesiastical changes introduced by the king, and he was one of the peers who tried to make him agree to the marriage of Catherine of Aragon; later he showed some eagerness to stand well with Thomas Cromwell, but this did not prevent his arrest in 1538. He is said to have denounced “the plucking down of abbey,” and he certainly consorted with many suspected persons. But he was soon released and pardoned, although he was obliged to hand over Halnaker to Henry VIII., receiving instead the estate of Wherwell in Hampshire. He died without children in September 1554, when his baronies of De La Warr and West fell into abeyance. His monument may still be seen in the church at Broadwater, Sussex.

His widow had settled her estate on his nephew William West (c. 1510-1595), who then tried to bring about his uncle's death by poison; for this reason he was disabled by act of parliament (1549) from succeeding to his honours. However, in 1563 he was restored, and in 1570 was created by patent Baron De La Warr. This was obviously a new creation, but in 1596 his son Thomas (c. 1556-1602) claimed precedence in the barony as the holder of the ancient barony of De La Warr. His claim was admitted, and accordingly his son and successor, next mentioned, is called the 3rd or the 12th baron.

THOMAS WEST, 3rd or 12th Baron De La Warr (1577-1618), British soldier and colonial governor in America, was born on the 9th of July 1577, probably at Wherwell, Hampshire, where he was baptized. He was educated at Queen's College, Oxford, where he did not complete his course, but subsequently (1605) received the degree of M.A. In 1597 he was elected member of parliament for Lymington, and subsequently fought in Holland and in Ireland under the earl of Essex, being knighted for bravery in battle in 1599. He was imprisoned for complicity in Essex's revolt (1600-1601), but was soon released and exonerated. In 1602 he succeeded to his father's title and estates and became a privy councillor. Becoming interested in schemes for the colonization of America, he was chosen a member of the council of the Virginia Company in 1609, and in the same year was appointed governor and captain-general of Virginia for life.

Sailing in March 1610 with three ships, 150 settlers and supplies, he himself bearing the greater part of the expense of the expedition. He arrived at Jamestown on the 10th of June, time to inter 20 the colonists who had embarked for England and were abandoning the enterprise. Lord De La Warr's rule was strict but just; he constructed two forts near the mouth of the James river, rebuilt Jamestown, and in general brought order out of chaos. In March 1621 he returned to London, where he published at the request of the company's council, his Relation of the condition of affairs in Virginia (reprinted 1859 and 1868). He remained in England until 1618, when he was released, at the behest of the company, on the very day the treaty of the jubilee, Samuel Argall, led him to start again for Virginia. He embarked in April, but died en route on the 7th of June 1618, and was buried at sea. The Delaware river and the state of Delaware were named in his honour.

A younger brother, Francis (1586-1643), was prominent in the affairs of Virginia, and in 1627-1628 was president of the council, and acting-governor of the colony.

In 1701 the 3rd or 12th baron's descendant, John, 7th or 16th Baron De La Warr (1603-1676), was created Viscount Cantelupe and 1st Earl De La Warr. He was a prominent figure in the House of Lords, at first as a supporter of Sir Robert Walpole. He also served in the British army and fought at Dettingen, and was made governor of Guernsey in 1751.

George West, 5th earl (1701-1759), married Elizabeth, sister and heiress of George John Frederick Sackville, 4th Duke of Dorset, who was created Baroness Buckhurst in 1864; consequently in 1843 he and his sons took the name of Sackville-West. The earl was twice lord chamberlain to Queen Victoria, and he is celebrated as "Fair Euryalus" in the Childish Recollections of his schoolfellow, Lord Byron. His son Charles Richard (1815-1873), 6th earl, served in the first Sikh war and in the Crimea; and being unmarried was succeeded by his brother Reginald (1817-1896) as 7th Earl De La Warr. Having inherited his mother's barony of Buckhurst on her death in 1870, he retained this title along with the barony and earldom of De La Warr, although the patent had contained a proviso that it should be kept separate from these dignities. In 1890 the 7th earl's son, Gilbert George Reginald Sackville-West (b. 1860), became 8th earl De La Warr.

See G. E. Cokayne, Complete Peerage (1887-1898).
agreed to admit Austria to the union, found themselves forced in 1853 to renew the old union, from which Austria was excluded. Delbrück now began, with the support of Bismarck, to apply the principles of free trade to Prussian fiscal policy. In 1862 he concluded an important commercial treaty with France. In 1867 he became the first president of the chancery of the North German Confederation, and represented Bismarck on the federal tariff council (Zollbundsrath), a position of political as well as fiscal importance owing to the presence in the council of representatives of the southern states. In 1868 he became a Prussian minister without portfolio. In October 1870, when the union of Germany under Prussian headship became a practical question, Delbrück was chosen to go on a mission to the South German states, and contributed greatly to the agreements concluded at Versailles in November. In 1871 he became president of the newly constituted Reichskanzleramt. Delbrück, however, began to feel himself uneasy under Bismarck's leanings towards protection and state control. On the introduction of Bismarck's plan for the acquisition of the railways by the state, Delbrück resigned office, nominally on the ground of ill-health (June 1, 1876). In 1870 he opposed in the Reichstag the new protectionist tariff, and on the failure of his efforts retired definitely from public life. In 1896 he received from the emperor the order of the Black Eagle. He died at Berlin on the 1st of February 1903.

DELCASSE, THEOPHILE (1852— ). French statesman, was born at Pamiers, in the department of Ariège, on the 1st of March 1852. He wrote articles on foreign affairs for the République française and Paris, and in 1880 was elected conseiller général of his native department, standing as "un disciple fidèle de Gambetta." In the following year he entered the chamber as deputy for Foix. He was appointed under-secretary for the colonies in the second Ribot cabinet (January to April 1893), and retained his post in the Dupuy cabinet till its fall in December 1893. It was largely owing to his efforts that the French colonial office was made a separate department with a minister at its head, and to this office he was appointed in the second Dupuy cabinet (May 1894 to January 1895). He gave a great impetus to French colonial enterprise, especially in West Africa, where he organized the newly acquired colony of Dahomey, and despatched the Liéotard mission to the Upper Ubangi. While in opposition he devoted special attention to naval affairs, and in speeches that attracted much notice declared that the function of the French navy was to secure and develop colonial enterprise, depredate all attempts to rival the British fleet, and advocated the construction of commerce destroyers as France's best reply to England. On the formation of the second Brisson cabinet in June 1898 he succeeded M. Hanotaux at the foreign office, and retained that post under the subsequent premierships of M.M. Dupuy, Waldemar Rousseau, Combes and Rouvier. In 1898 he had to deal with the delicate situation caused by Captain Marchand's occupation of Fashoda, for which, as he admitted in a speech in the chamber on the 23rd of January 1890, he accepted full responsibility, since it arose directly out of the Liéotard expedition, which he had himself organized while minister for the colonies; and in March 1899 he concluded an agreement with Great Britain by which the difficulty was finally adjusted, and France consolidated her vast colonial empire in North-West Africa. In the same year he acted as mediators between the United States and Spain, and brought the peace negotiations to a successful conclusion. He introduced greater cordiality into the relations of France with Italy: at the same time he adhered firmly to the alliance with Russia, and in August 1899 made a visit to St Petersburg, which he repeated in April 1901. In June 1900 he made an arrangement with Spain, fixing the long-disputed boundaries of the French and Spanish possessions in West Africa. Finally he concluded with England the important agreements of 1904 covering colonial and other questions which had long been a matter of dispute, especially concerning Egypt, Newfoundland and Morocco. Suspicion of the growing entente between France and England soon arose on the part of Germany, and in 1905 German assertiveness was shown in a crisis which was forced on in the matter of the French activity in Morocco (q.v.), in which the handling of French policy by M. Delcassé personally was a sore point with Germany. The situation became acute in April, and was only relieved by M. Delcassé's resignation of office. He retired into private life, but in 1908 was warmly welcomed on a visit to England, where the closest relations now existed with France.

DEL CREDERE (ital. "of belief" or "trust"). A "del credere agent," in English law, is one who, selling goods for his principal on credit, undertakes for an additional commission to sell only to persons who are absolutely sound in credit. His position is thus that of a surety who is liable to his principal should the vendee make default. The agreement between him and his principal need not be reduced to or evidenced by writing, for his undertaking is not a guarantee within the Statute of Frauds. See also Broker; Guarantee.

DELESLUZE, LOUIS CHARLES (1809—1871), French journalist, was born at Dreuax on the 2nd of October 1809. Having studied law in Paris, he early developed a strong democratic bent, and played a part in the July revolution of 1830. He became a member of various republican societies, and in 1836 was forced to take refuge in Belgium, where he devoted himself to republican journalism. Returning in 1840 he settled in Valenciennes, and after the revolution of 1848 removed to Paris, where he started a newspaper called La Révolution démocratique et sociale. His zeal so far outran his discretion that he was twice imprisoned and fined, his paper was suppressed, and he himself fled to England, where he continued his journalistic work. He was arrested in Paris in 1853, and deported to French Guiana. Released from the amnesty of 1859, he returned to France with health shattered but energies unimpaired. His next venture was the publication of the Réveil, a radical organ upholding the principles of the Association internationale des travailleurs, known as the "Internationale." This journal, which brought him three condemnations, fine and imprisonment in one year, shared the fate of his Paris sheet, and its founder again fled to Belgium. In 1871 he was elected to the National Assembly, becoming afterwards a member of the Paris commune. At the siege of Paris he fought with reckless courage, and met his death on the last of the barricades (May 1871). He wrote an account of his imprisonment in Guiana, De Paris à Cayenne, Journal d'un transporté (Paris, 1866).

DELESSE, ACHILLE ERNEST OSCAR JOSEPH (1817—1881), French geologist and mineralogist, was born at Metz on the 3rd of February 1817. At the age of twenty he entered the École Polytechnique, and subsequently passed through the École des Mines. In 1845 he was appointed to the chair of mineralogy and geology at Besançon; in 1850 to the chair of geology at the Sorbonne in Paris; and in 1864 professor of agriculture at the École des Mines. In 1873 he became inspector-general of mines. In early years as ingénieur des mines he investigated and described various new minerals; he proceeded afterwards to the study of rocks, devising new methods for their determination, and giving particular descriptions of malphyre, arkose, porphyry, syenite, &c. The igneous rocks of the Vosges, and those of the Alps, Corsica, &c., and the subject of metamorphism occupied his attention. He also prepared in 1858 geological and hydrological maps of Paris—with reference to the underground water, similar maps of the departments of the Seine and Seine-et-Marne, and an agronomic map of the Seine-et-Marne (1880), in which he showed the relation which exists between the physical and chemical characters of the soil and the geological structure. His annual Rapports de géologie, undertaken with the assistance (1860—1869) of Auguste Lauge, and afterwards (1865—1878) of Albert de Lapparent, was carried on from 1860 to 1880. His observations on the lithology of the deposits accumulated beneath the sea were of special interest and importance. His separate publications were: Recherches sur l'origine des roches (Paris, 1842); Étude sur les phénomènes litiques, (1850); Bébize, et la géologie des mers de France et des mers principales du globe (2 vols. and atlas, 1871). He died at Paris on the 24th of March 1881.

DELESSERT, JULES PAUL BENJAMIN (1773—1847), French banker, was born at Lyons on the 14th of February 1773, the son of Étienne DeleSSERT (1735—1816), the founder of the first
fire insurance company and the first discount bank in France. Young Delessert was travelling in England when the Revolution broke out in France, but he hastened back to join the Paris National Guard in 1790, becoming an officer of artillery in 1793. His father bought him out of the army, however, in 1795 in order to entrust him with the management of his bank. Gifted with remarkable energy, he started many commercial enterprises, founding the first cotton factory at Passy in 1801, and a sugar factory in 1802, for which he was created a baron of the empire. He sat in the chamber of deputies for many years, and was a strong advocate for many humane measures, notably the suppression of the “Tours” or revolving box at the founding hospital, the suppression of the death penalty, and the improvement of the penitentiary system. He was made regent of the Bank of France in 1802, and was also member of, and, indeed, founder of many, learned and philanthropic societies. He founded the first savings bank in France, and maintained a keen interest in it until his death in 1847. He was also an ardent botanist and conchologist; his botanical library embraced 30,000 volumes, of which he published a catalogue—Musee botanique et conchologique de la Société d’histoire naturelle de la caisse d’épargne et de prévoyance (1835), Memoire sur un projet de bibliothèque royale (1836), Le Guide de bonheur (1839), and Recueil de cognales décrites par Lamarck (1841–1842).

DELFICO, MELCHIORRE (1744–1835), Italian economist, was born at Teramo in the Abruzzi on the 1st of August 1744, and was educated at Naples. He devoted himself specially to the study of jurisprudence and political economy, and his numerous publications exercised great practical influence in the correction and extinction of many abuses. Under Joseph Bonaparte Delisco was made a councillor of state, an office which he held until the restoration of Ferdinand IV., when he was appointed president of the commission of archives, from which he retired in 1825. He died at Teramo on the 21st of June 1835. His most important works were: Saggio filosofico sul matrimonio (1774); Memoria sul Tribunale della Grazia e sulle leggi economiche nelle province confinanti del regno (1785), which led to the abolition in Naples of the most vexatious and absurd restrictions on the sale and exportation of agricultural produce; Riflessioni su la vendita dei feudai (1790) and Lettera a Sua Ecc. il sig. Duca di Cantalupo (1795), which brought about the abolition of feudal rights over landed property and their sale; Ricerche sul vero carattere della giurisprudenza Romana e dei suoi cultori (1791); Pensieri su la storia e su l’incertezza ed inutilità della medesima (1806), both on the early history of Rome.

See F. Mozetti, Degli studi, delle opere e delle virtù di Melchiorre Delisco; Tipaldi’s Biografia degli Italiani illustri (vol. ii.).

DELF, a town of Holland in the province of South Holland, on the Schie, 5 m. by rail S.E. by S. of the Hague, with which it is also connected by steam-tramway. Pop. (1900) 31,582. It is a quiet, typically Dutch town, with its old brick houses and tree-bordered canals. The Prinsenhof, previously a monastery, was converted into a residence for the counts of Orange in 1575; it was here that William the Silent was assassinated. It is now used as a William of Orange Museum. The New Church, formerly the church of St Ursula (14th century), is the burial place of the princes of Orange. It is remarkable for its fine tower and chimes of bells, and contains the splendid allegorical monument of William the Silent, executed by Hendrik de Keyser and his son Pieter about 1621, and the tomb of Hugo Grotius, born in Delft in 1583, whose statue, erected in 1886, stands in the market-place outside the church. The Old Church, founded in the 11th century, but in its present form dating from 1476, contains the monuments of two famous admirals of the 17th century, Martin van Tromp and Piet Hein, as well as the tomb of the naturalist Leeuwenhoek, born at Delft in 1632. In the town hall (1618) are some corporation pictures, portraits of the counts of Orange and Nassau, including several by Michiel van Mierevelt (1567–1641), one of the earliest Dutch portrait painters, and with his son Pieter (1595–1633), a native of Delft. There are also a Roman Catholic church (1882) and a synagogue. Two important educational establishments are the Indian Institute for the education of civil service students for the colonies, to which is attached an ethnographical museum; and the Royal Polytechnic school, which almost ranks as a university, and teaches, among other sciences, that of diking. A fine collection of mechanical models is connected with the polytechnic school. Among other buildings are the modern “Phoenix” club-house of the students; the hospital, containing some anatomical pictures, including one by the two Mierevelts (1617); a lunatic asylum; the Van Renswoude orphanage, the theatre, a school of design, the powder magazine and the state arsenal, originally a warehouse of the East India Company, and now used as a manufactory of artillery stores.

The name of Delft is most intimately associated with the manufacture of the beautiful faience pottery for which it was once famous. (See Ceramics.) This industry was imported from Haarlem towards the end of the 16th century, and achieved an unrivalled position in the second half of the following century; but it did not survive the French occupation at the end of the 18th century. It has, however, been revived in modern times under the name of “New Delft.” Other branches of industry are oil and soda manufacture, sugar, and the manufacture of arms and bullets. There is also an important butter and cheese market.

Delft was founded in 1075 by Godfrey III., duke of Lower Lorraine, after his conquest of Holland, and came subsequently into the hands of the counts of Holland. In 1246 it received a charter from Count William II. (see C. Hegel, Städte und Gilden, ii. 251). In 1536 it was almost totally destroyed by fire, and in 1654 largely ruined by the explosion of a powder magazine.

DELHI, DELHI or DILLI, the ancient capital of the Mogul empire in India, and a modern city which gives its name to a district and division of British India. The city of Delhi is situated in 28° 38′ N., 77° 13′ E., very nearly due north of Cape Comorin, and practically in a latitudinal line with the more ancient cities of Cairo and Canton. It lies in the south-east corner of the province of the Punjab, to which it was added in 1838, and abuts on the right bank of the river Jumna. Though Lahore, the more ancient city, remains the official capital of the Punjab, Delhi is historically more famous, and is now more important as a commercial and railway centre.

Though the remains of earlier cities are scattered round Delhi over an area estimated to cover some 45 sq. m., modern Delhi dates only from the middle of the 17th century, when Shah Jahan rebuilt the city on its present site, adding the title Shah-jahanabad from his own name. It extends for nearly 2½ m. along the right bank of the Jumna from the Water bastion to the Wellesley bastion in the south-east corner, nearly one-third of the frontage being occupied by the river wall of the palace. The northern wall, famous in the siege of Delhi in 1857, extends three-quarters of a mile from the Water bastion to the Shah, commonly known as the Mori, bastion; the length of the west wall from this bastion to the Ajmere gate is 1½ m. and of the south wall to the Wellesley bastion again almost exactly the same distance, the whole land circuit being thus 3½ m. The complete circuit of Delhi is 5½ m. In the north wall is situated the famous Kashmir gate, while the Mahtura gate, which was built by a Mahratta governor, has now been removed. In the west wall are the Farash Khana and Ajmere gates, while the Khabul and Lahore gates have been removed. In the south wall are the Turkman and Delhi gates. The gates on the river side of the city included the Khasarati and Rajghat, the Calcutta and Nigambod—both removed; the Kela gate, and the Badar Rao gate, now closed. The great wall of Delhi, which was constructed by Shah Jahan, was strengthened by the English by the addition of a ditch and glacis, after Delhi was captured by Lord Lake in 1803; and its strength was turned against the British at the time of the Mutiny. The imperial palace (1638–1648), now known as the “Fort,” is situated on the east of the city, and abuts directly on the river. It consists at present of bare and ugly British barracks, among which are scattered exquisite gems of ornamental architecture. The
two most famous among its buildings are the Diwan-i-Am or Hall of Public Audience, and the Diwan-i-Khas or Hall of Private Audience. The Diwan-i-Am is a splendid building measuring 100 ft. by 60 ft., and was formerly plastered with chunam and overlaid with gold. The most striking effect now lies in its engraved arches. It was in the recess in the back wall of this hall that the famous Peacock Throne used to stand, “so called from its having the figures of two peacocks standing behind it, their tails being expanded and the whole so inlaid with sapphires, rubies, emeralds, pearls and other precious stones of appropriate colours as to represent life.” Tavernier, the French jeweller, who saw Delhi in 1665, describes the throne as of the shape of a bed, 6 ft. by 4 ft., supported by four golden feet, 20 to 25 in. high, from the bars above which rose twelve columns to support the canopy; the bars were decorated with crosses of rubies and emeralds, and also with diamonds and pearls. In all there were 105 large rubies on the throne, and 116 emeralds, but many of the latter had flaws. The twelve columns supporting the canopy were decorated with rows of splendid pearls, and Tavernier considered these to be the most valuable part of the throne. The whole was valued at £6,000,000. This throne was carried off by the Persian invader Nadir Shah in 1739, and has been rumoured to exist still in the Treasure House of the Shah of Persia; but Lord Curzon, who examined the throne there, says that nothing now exists of it, except perhaps some portions worked up in a modern Persian throne. The Diwan-i-Khas is smaller than the Diwan-i-Am, and consists of a pavilion of white marble, in the interior of which the art of the Moguls reached the perfection of its jewel-like decoration. On a marble platform rises a marble pavilion, the flat-topped roof of which is supported on a double row of marble pillars. The inner face of the arches, with the spandrels and the pilasters which support them, are covered with flowers and foliage of delicate design and dainty execution, crusted in green serpentine, blue lapis lazuli and red and purple porphyry. During the lapse of years many of these stones were picked from their setting, and the silver ceiling of flowered patterns was pillaged by the Maharratas; but the inlaid work was restored as far as possible by Lord Curzon. It is in this hall that the famous inscription “If a paradise be on the face of the earth, it is this, it is this, it is this,” still exists. It is given in Persian characters twice in the panels over the narrow arches at the ends of the middle hall, beginning from the east on the north side, and from the west at the south side. At the time of the Delhi Durbar held in January 1903 to celebrate the proclamation of Edward VII, as emperor of India these halls were used as a dressing-room and supper-room, and their whole beauty was brought out by the electric light shining through their marble grille-work.

The native city of Delhi is like most other cities in India, a huddle of mean houses in mean streets, diversified with splendid mosques. The Chandni Chauk (“silver street”), the principal street of Delhi, which was once supposed to be the richest street in the world, has fallen from its high estate, though it is still a broad and imposing avenue with a double row of trees running down the centre. During the course of its history it was four times sacked, by Nadir Shah, Timur, Ahmad Shah and the Maharratas, and its roadway has many times run with blood. Now it is the abode of the jewelers and ivory-workers of Delhi, but the jewels are seldom valuable and the carving has lost much of its old delicacy. A short distance south of the Chandni Chauk the Jama Masjid, or Great Mosque, rises boldly from a small rocky eminence. It was erected in 1648-1650, two years after the royal palace, by Shah Jahan. Its front court, 450 ft. square, and surrounded by a cloister open on both sides, is paved with granite inlaid with marble, and commands a fine view of the city. The mosque itself, a splendid structure forming an oblong 261 ft. in length, is approached by a magnificent flight of stone steps. Three domes of white marble rise from its roof, with two tall minarets at the front corners. The interior of the mosque is paved throughout, and the walls and roof are lined, with white marble. Two other mosques in Delhi itself deserve passing notice, the Kala Masjid or Black Mosque, which was built about 1380 in the reign of Feroz Shah, and the Moti Masjid or Pearl Mosque, a tiny building added to the palace by Aurangzeb, as the emperor’s private place of prayer. It is only 60 ft. square, and the domes alone are seen above the red sandstone walls until the opening of two small fine brass gates.

To the west and north-west of Delhi considerable suburbs cluster beyond the walls. Here are the toms of the imperial family. That of Humayun, the second of the Mogul dynasty, is a noble building of rose-coloured sandstone inlaid with white marble. It lies about 3 m. from the city, in a terraced garden, the whole surrounded by an embattled wall, with towers and four gateways. In the centre stands a platform about 20 ft. high by 200 ft. square, supported by arches and ascended by four flights of steps. Above, rises the mausoleum, also a square, with a great dome of white marble in the centre. About a mile to the west is another burying-ground, or collection of tombs and small mosques, some of them very beautiful. The most remarkable is perhaps the little chapel in honour of a celebrated Mussulman saint, Nizam-ud-din, near whose shrine the members of the imperial family, up to the time of the Mutiny, lie buried, each in a small enclosure surrounded by lattice-work of white marble.

Still farther away, some 10 m. south of the modern city, amid the ruins of old Delhi, stands the Kutb Minar, which is supposed to be the most perfect tower in the world, and one of the seven architectural wonders of India. The Minar was begun by Kutb ud-din Aibak about A.D. 1200. The two top storeys were rebuilt by Feroz Shah. It consists of five storeys of red sandstone and white marble. The purplish red of the sandstone at the base is finely modulated, through a pale pink in the second storey, to a dark orange at the summit, which harmonizes with the blue of an Indian sky. Dark bands of Arabic writing round the three lower storeys contrast with the red sandstone. The height of the column is 238 ft. The plinth is a polygon of twenty sides. The basement storey has the same number of faces formed into convex flutes which are alternately angular and semicircular. The next has semicircular flutes, and in the third they are all angular. Then rises a plain storey, and above it soars a partially fluted storey, the shaft of which is adorned with bands of marble and red sandstone. A bold projecting balcony, richly ornamented, runs round each storey. After six centuries the column is almost as fresh as on the day it was finished. It stands in the south-east corner of the outer court of the mosque erected by Kutb-ud-din immediately after his capture of Delhi in 1319. The design of this mosque is Mahomedan, but the wonderfully delicate ornamentation of its western façade and other remaining parts is Hindu. In this inner courtyard of the mosque stands the Iron Pillar, which is probably the most ancient monument in the neighbourhood of Delhi, dating from about A.D. 490. It consists of a solid shaft of wrought iron some 16 in. in diameter and 23 ft. 8 in. in height, with an inscription eulogizing Chandragupta Vikramaditya. It was brought, probably from Muttra, by Anang Pal, a Rajput chief of the Tomaras, who erected it here in 1052.

Among the modern buildings of Delhi may be mentioned the Residency, now occupied by a government high school, and the Protestant church of St. James, built at a coast of £10,000 by Colonel Skinner, an officer well known in the history of the East India Company. About half-way down the Chandni Chauk is a high clock-tower. Near it is the town hall, with museum and library. Behind the Chandni Chauk, to the north, lie the Queen’s Gardens; beyond them the “city lines” stretch away as far as the well-known rocky ridge, about a mile outside the town. From the summit of this ridge the view of the station and city is very picturesque. The principal local institution until 1877 was the Delhi College, founded in 1792. It was at first exclusively an oriental school, supported by the voluntary contributions of Mammoo Khan, an emir, and managed by a committee of the subscribers. In 1829 an English department was added to it; and in 1855 the institution was placed under the control of the Educational Department. In the Mutiny of 1857 the old

1See the paper by V. A. Smith in the Journal of the Royal Asiatic Soc. (1867), p. 13.
college was plundered of a very valuable oriental library, and the building completely destroyed. A new college was founded in 1858, and was affiliated to the university of Calcutta in 1864. The old college attained great celebrity as an educational institution, and produced many excellent scholars, but it was abolished in 1877, in order to concentrate the grant available for higher-class education upon the Punjab University at Lahore.

The Ridge, famous as the British base during the siege of Delhi during the Mutiny, in 1857, is a last outcrop of the Aravalli Hills which rises in a steep escarpment some 60 ft. above the city. At its nearest point on the right of the British position, where the Mutiny Memorial now stands, the Ridge is only 1200 yds. from the walls of Delhi; at the Flagstaff Tower in the centre of the position it is a mile and a half away; and at the left near the river nearly two miles and a half. It was behind the Ridge at this point that the main portion of the British camp was pitched. The Mutiny Memorial, which was erected by the army before Delhi, is a rather poor specimen of a Gothic spire in red sandstone, while the memorial tablets are of inferior marble. Next to the Ridge the point of most interest to every English visitor to Delhi is Nicholson's grave, which lies encircled by an iron railing in the British Cemetery. The Kashmiri gate has a slab recording the gallant deed of the party under Lieutenants D. C. Home and P. Salkeld, who blew in the gate in broad daylight on the day that Delhi was taken by assault.

The population of Delhi according to the census of 1901 was 208,575, of whom 88,460 were Mohammedans and 114,417 were Hindus. The city is served by five different railways, the East Indian, the Oudh & Rohilkhand, the Rajputana-Malwa & Bombay-Baroda, the Southern Punjab, and the North-Western, and occupies a central position, being 940 m. from Karachi, 950 from Calcutta, and 660 from Bombay. Owing to the advantages it enjoys as a trade centre, Delhi is recovering much of the prominence which it lost at the time of the Mutiny. It has spinning-mills and other mills worked by steam. The principal manufactures are gold and silver filigree work and embroidery, jewelry, muslins, shawls, glazed pottery and wood-carving.

The District of Delhi has an area of 1290 sq. m. It consists of a strip of territory on the right or west bank of the Jumna river, 75 m. in length, and varying from 15 to 235 m. in breadth. Most of the area consists of hard and stony soil, depending upon irrigation, which is supplied by the Western Jumna canal, the Ali Mardan canal and the Agras canal. The principal crops are wheat, barley, sugar-cane and cotton.

When Lord Lake broke the Mahratta power in 1803, and the emperor was taken under the protection of the East India Company, the present districts of Delhi and Hissar were assigned for the maintenance of the royal family, and were administered by a British resident. In 1832 the office of resident was abolished, and the tract was annexed to the North-Western Provinces. After the Mutiny in 1858 it was separated from the North-Western Provinces and annexed to the Punjab. The population in 1901 was 686,030.

The Division of Delhi stretches from Simla to Rajputana, and is much broken up by native states. It comprises the seven districts of Hissar, Rohtak, Gurgaon, Delhi, Karnal, Umballa and Simla. Its total area is 15,931 sq. m., and in 1901 the population was 4,587,092.

According to legends, which may or may not have a substantial basis, Delhi or its immediate neighbourhood has from time immemorial been the site of a capital city. The neighbouring village of Indarpur preserves the name of Indraprasta, the semi-mythical city founded, according to the Sanscrit epic Mahabharata, by Yudhishthira and his brothers, the five Pandavas. Whatever its dim predecessors may have been, however, the actual history of Delhi dates no further back than the 11th century A.D., when Anangapala (Anang Pal), a chief of the Tomara clan, built the Red Fort, in which the Kuth Minor now stands; in 1032 the same chief removed the famous Iron Pillar from its original position, probably at Muttra, and set it up among a group of temples of which the materials were afterwards used by the Musalmans for the construction of the great Kuth Mosque. About the middle of the 12th century the Tomara dynasty was overthrown by Vira-gra-ja (Visala-deva, Bisal Deo), the Chauhan king of Ajmer, who from inscribed records discovered of late years appears to have been a man of considerable culture (see V. A. Smith, Early Hist. of India, ed. 1908, p. 356). His nephew and successor was Prithwi-raj (Prithiraj), or Rā Pithora, lord of Sambhar, Delhi and Ajmere, whose fame as lover and warrior still lives in popular story. He was the last Hindu ruler of Delhi. In 1191 came the invasion of Mahommeh of Ghor. Defeated on this occasion, Mahommeh returned two years later, overthrew the Hindus, and captured and put to death Prithwi-raj. Delhi became henceforth the capital of the Mahommehian Indian empire, Kuth-ud-din (the general and slave of Mahommeh of Ghor) being left in command. His dynasty is known as that of the slave kings, and it is to them that old Delhi owes its greatest remains, among them Kuth Mosque and the Kuth Minor. The slave dynasty retained the throne till 1290, when it was subverted by Jalal-ud-din Khilji. The most remarkable monarch of this dynasty was Ala-ud-din, during whose reign Delhi was twice exposed to attack from invading hordes of Moguls. On the first occasion Ala-ud-din defeated them under the walls of his capital in 1236, after encamping for two months in the neighbourhood of the town which he repaired without a battle. The house of Khilji came to an end in 1321, and was followed by that of Tughlak. Hitherto the Pathan kings had been content with the ancient Hindu capital, altered and adorned to suit their tastes. But one of the first acts of the founder of the new dynasty, Ghaus-ud-din Tughlak, was to erect a new capital about 4 m. farther to the east, which he called Tughlakabad. The ruins of his fort remain, and the eye can still trace the streets and lanes of the long deserted city. Ghaus-ud-din was succeeded by his son Mahommeh b. Tughlak, who reigned from 1325 to 1351, and is described by Elphinstone as "one of the most accomplished princes and most furious tyrants that ever adorned or disgraced human nature." Under this monarch the Delhi of the Tughlak dynasty attained its utmost growth. His successor Feroz Shah Tughlak transferred the capital to a new town which he founded some miles off, on the north of the Kuth, and to which he gave his own name, Ferozabad. In 1398, during the reign of Mahum Mad Tughlak, occurred the Tatar invasion of India, when Timur latest, a Moslem, defeated them under the walls of Delhi, and the city surrendered. The town, notwithstanding a promise of protection, was plundered and burned; the citizens were massacred. The invaders at last retired, leaving Delhi without a government, and almost without inhabitants. At length Mahum Mad Tughlak regained a fragment of his former kingdom, but on his death in 1412 the family became extinct. He was succeeded by the Sayyid dynasty, which held Delhi and a few miles of surrounding territory till 1444, when it gave way to the house of Lodil, during whose rule the capital was removed to Agra. In 1526 Baber, sixth in descent from Timur- lane, invaded India, defeated and killed Ibrahim Lodl at the battle of Panipat, entered Delhi, was proclaimed emperor, and finally put an end to the Afghan empire. Baber's capital was at Agra, but his son and successor, Humayun, removed it to Delhi. In 1540 Humayun was defeated and expelled by Sher Shah, who entirely rebuilt the city, enclosing and fortifying it with a new wall. In his time Delhi extended from where Humayun's tomb lies, near the southern gate of the modern city. In 1555 Humayun, with the assistance of Persia, regained the throne; but he died within six months, and was succeeded by his son, the illustrious Akbar.

During Akbar's reign and that of his son Jahangir, the capital was either at Agra or at Lahore, and Delhi once more fell into decay. Between 1638 and 1658, however, Shah Jahan rebuilt it almost in its present form; and his city remains substantially the Delhi of the present time. The imperial palace, the Jama Masjid or Great Mosque, and the restoration of what is now the western Jumna canal, are the work of Shah Jahan. The Mogul empire rapidly expanded during the reigns of Akbar and his successors down to Aurungzeb, when it attained its climax. After the death of the latter monarch, in 1707, came the decline. Insurrections
and civil wars on the part of the Hindu tributary chiefs, Sikhs and Mahrattas, broke out. Aurungzeb's successors became the helpless instruments of conflicting chiefs. His grandson, Jahandar Shah, was, in 1713, deposed and strangled after a reign of one year; and Farrakshiyar, the next in succession, met with the same fate in 1719. He was succeeded by Mahommed Shah, in whose reign the Mahratta forces first made their appearance before the gates of Delhi, in 1736. Three years later the Persian monarch, Nadir Shah, after defeating the Mogul army at Karnal, entered Delhi in triumph. While engaged in levying a heavy contribution, the Persian troops were attacked by the populace, and many of them were killed. Nadir Shah, after vainly attempting to stay the tumult, at last gave orders for a general massacre of the inhabitants. For fifty-eight days Nadir Shah remained in Delhi, and when he left he carried with him a treasure in money amounting, at the lowest computation, to eight or nine millions sterling, besides jewels of inestimable value, and other property to the amount of several millions more.

From this time (1740) the decline of the empire proceeded unchecked and with increased rapidity. In 1771 Shah Alam, the son of Alamgir II, was nominally raised to the throne by the Mahrattas, who now sought to win for themselves the title of chief, Sindia. An attempt of the puppet emperor to shake himself clear of the Mahrattas, in which he was defeated in 1788, led to a permanent Mahratta garrison being stationed at Delhi. From this date, the king remained a cipher in the hands of Sindia, who treated him with studied neglect, until the 8th of September 1803, when Lord Lake overthrew the Mahrattas under the walls of Delhi, entered the city, and took the king under the protection of the British. Delhi, once more attacked by a Mahratta army under the Mahratta chief Holkar in 1804, was gallantly defended by Colonel Ochterlony, the British resident, who held out against overwhelming odds for eight days, until relieved by Lord Lake. From this date a new era in the history of Delhi began. A pension of £120,000 per annum was allowed to the king, with exclusive jurisdiction over the palace, and the titular sovereignty as before; but the city, together with the Delhi territory, passed under British administration.

Fifty-three years of quiet prosperity for Delhi were brought to a close by the Mutiny of 1857. Its capture by the mutineers, its siege, and its subsequent recapture by the British have been oftentimes the subject of dispute, and the evidence is called for. The outbreak at Meerut occurred on the night of the 10th of May 1857. Immediately after the murder of their officers, the rebel soldiery set out for Delhi, about 35 m. distant, and on the following morning entered the city, where they were joined by the city mob. Mr Fraser, the commissioner, Mr Hutchinson, the collector, Captain Douglas, the commandant of the palace guards, and the Rev. Mr Jennings, the residency chaplain, were at once murdered, as were also most of the civil and non-official residents whose houses were situated within the city walls. The British troops in cantonments consisted of three regiments of native infantry and a battery of artillery. These cast in their lot with the mutineers, and commenced by killing their officers. The Delhi magazine, then the largest in the north-west of India, was in the charge of Lieutenant Willoughby, with whom were two other officers and six non-commissioned officers. The magazine was attacked by the mutineers, but the little band defended to the last the enormous accumulation of munitions of war stored there, and, when further defence was hopeless, fired the magazine. Five of the nine men were killed by the explosion, and Lieutenant Willoughby subsequently died of his injuries; the remaining three succeeded in making their escape. The occupation of Delhi by the rebels was the signal for risings in almost every military station in North-Western India. The revolted soldiery with one accord thronged towards Delhi, and in a short time the city was garrisoned by a rebel army variously estimated at from 50,000 to 70,000 disciplined men. The pensioned king, Bahadur Shah, was proclaimed emperor; his sons were appointed to various military commands. About fifty Europeans and Eurasians, nearly all females, who had been captured in trying to escape from the town on the day of the outbreak, were confined in a stifling chamber of the palace for fifteen days; they were then brought out and massacred in the court-yard.

The siege which followed forms one of the memorable incidents of the British history of India. On the 8th June, four weeks after the outbreak, Sir H. Barnard, who had succeeded as commander-in-chief on the death of General Anson, routed the mutineers with a handful of Europeans and Sikhs, after a severe action at Badli-Ki-Serai, and encamped upon the Ridge that overlooks the city. The force was too weak to capture the city, and he had no siege train or heavy guns. All that could be done was to hold the position till the arrival of reinforcements and of a siege train. During the next three months the little British force on the Ridge were rather the besieged than the besiegers. Almost daily sallies, which often turned into pitched battles, were made by the rebels upon the over-worked handful of Europeans, Sikhs and Gurkhas. A great struggle took place on the centenary of the battle of Plassey (June 23), and another on the 25th of August; but on both occasions the mutineers were repulsed with heavy loss. General Barnard died of cholera in July, and was succeeded by General Archdale Wilson. Meanwhile reinforcements and siege artillery gradually arrived, and early in September it was resolved to make the assault. The first of the heavy batteries opened fire on the 8th of September, and on the 13th a practicable breach was reported.

On the morning of the 14th Sept. the assault was delivered, the points of attack being the Kashmir bastion, the Water bastion, the Kashmir gate, and the Lahore gate. The assault was thoroughly successful, although the column which was to enter the city by the Lahore gate sustained a temporary check. The whole eastern part of the city was retaken, but at a cost of 66 officers and 1104 men killed and wounded, out of the total strength of 8866. Fighting continued more or less during the next six days, and it was not till the 20th of September that the entire city and palace were occupied, and the reconquest of Delhi was complete. During the siege, the British force sustained a loss of 1012 officers and men killed, and 3837 wounded. Among the killed was General John Nicholson, the leader of one of the storming parties, who was shot through the body in the act of leading his men, in the first day's fighting. He lived, however, to learn that the whole city had been recaptured, and died on the 23rd of September. On the flight of the mutineers, the king and several members of the royal family took refuge at Humayan's tomb. On receiving a promise that his life would be spared, the last of the house of Tippoo surrendered to Major Hodson; he was afterwards banished to Ramnagar. Delhi, thus reconquered, remained for some months under military occupation. But according to the murder of several European soldiers who strayed from the lines, the native population was expelled the city. Hindus were soon afterwards readmitted, but for some time Mahommedans were rigorously excluded. Delhi was made over to the civil authorities in January 1858, but it was not till 1861 that the civil courts were regularly reopened. The shattered walls of the Kashmir gateway, and the bastions of the northern face of the city, still bear the marks of the cannonade of September 1857. Since that date Delhi has settled down into a prosperous commercial town, and a great railway centre. The lines which start from it to the north, south, east and west bring into its bazaars the trade of many districts. But the romance of antiquity still lingers around it, and Delhi was selected for the scene of the Imperial Proclamation on the 1st of January 1877, and for the Durbar held in January 1903 for the proclamation of King Edward VII. as emperor of India.

II. THE CITY.—The modern account of the city in Delhi Past and Present (1901), by H. C. Fanshawe, a former commissioner of Delhi. Other authoritative works are Cities of India (1903) and The Mutiny Papers (1893), both by G. W. Forrest, and Forty-One Years in India (1897), by Lord Roberts; while some impressionistic sketches will be found in Enchanted India (1899), by Prince Bojdar of Nara-georgevitch. See also the chapter on Delhi in H. G. Keene, Hist. of Hindustan... to the fall of the Moghul Empire (1885). For the Delhi Durbar of 1903 see Stephen Wheeler, Hist. of the Delhi Coronation Durbar, compiled from official papers by order of the viceroy of India (London, 1904), which contains numerous portraits and other illustrations.
DELIA, a festival of Apollo held every five years at the great Panegyris in Delos (Homeric Hymn to Apollo, 147). It included athletic and musical contests, at which prizes were a branch of the sacred palm. This festival was said to have been established by Theseus on his way back from Crete. Its celebration gradually fell into abeyance and was not revived till 426 B.C., when the Athenians purified the island and took it so prominent a part in the maintenance of the Delia that it came to be regarded almost as an Athenian festival (Thucydides iii. 104). Ceremonial embassies (θηρείαι) from all the Greek cities were present.

Schömm, Griechische Altertumer (4th ed., 1897-1902); P. Stengel, Die griechischen Kultsysteme (1898); T. Holmole in Darmenborg and Seghio's Dictionnaire des antiquités.

DELIAN LEAGUE, or CONFEDERACY OF DELOS, the name given to a confederation of Greek states under the leadership of Athens, with its headquarters at Delos, founded in 478 B.C. shortly after the final repulse of the expedition of the Persians under Xerxes I. This confederation, which after many modifications and vicissitudes was finally broken up by the capture of Athens by Sparta in 404, was revived in 378-7 (the "Second Athenian Confederacy") as a protection against Spartan aggression, and lasted, at least formally, until the victory of Philip II of Macedon at Chaeronea. These two confederations have an interest quite out of proportion to the significance of the detailed events which form their history. (See GREECE: Ancient History.) They are the first two examples of which we have detailed knowledge of a serious attempt at united action on the part of a large number of self-governing states at a relatively high level of conscious political development. The first league, moreover, in its later period affords the first example in recorded history of self-conscious imperialism in which the subordinate units enjoyed a specified local autonomy with an organized system, financial, military and judicial. The second league is further interesting as the precursor of the Achaean and Aeolian Leagues.

History.—Several causes contributed to the formation of the first Confederacy of Delos. During the 6th century B.C. Sparta had come to be regarded as the chief power, not only in the Peloponnesos, but also in Greece as a whole, including the islands of the Aegean. The Persian invasions of Darius and Xerxes, with the consequent importance of maritime strength and the capacity for distant enterprise, as compared with that of purely military superiority in the Greek peninsula, caused a considerable loss of prestige which Sparta was unwilling to recognize. Moreover, it chanced that at the time the Spartan leaders were not men of strong character or general ability. Pausanias, the victor of Plataea, soon showed himself destitute of the high qualities which the situation demanded. Personal cupidity, dishonesty to the allies, and a tendency to adopt the style and manners of oriental princes, combined to alienate from him the sympathies of the Ionian allies, who realized that, had it not been for the Athenians, the battle of Salamis would have been only fought, and Greece would probably have become a Persian satrapy. The Athenian contingent which was sent to aid Pausanias consisted of driving the Persians finally out of the Thracean towns was under the command of the Athenians, Aristides and Cimon, men of tact and probity. It is, not, therefore, surprising that when Pausanias was recalled to Sparta on the charge of treasonable overtures to the Persians, the Ionian allies appealed to the Athenians on the grounds of kinship and urgent necessity, and that when Sparta sent out Dorcis to supersede Pausanias he found Aristides in unquestioned command of the allied fleet. To some extent the Spartans were undoubtedly relieved, in that it no longer fell to them to organize distant expeditions to Asia Minor, and this feeling was strengthened about the same time by the treachery conduct of their king Leotychides (q.v.) in Thessaly. In any case the enclastic quality of the Spartan system was unable to adapt itself to the spirit of the new age. To Aristides was mainly due the organization of the new league and the adjustment of the contributions of the various allies in ships or in money. His assessment, of the details of which we know nothing, was so fair that it remained popular long after the league of autonomous allies had become an Athenian empire. The general affairs of the league were managed by a synod which met periodically in the temple of Apollo and Artemis at Delos, the ancient centre sanctified by the common worship of the Ionians. In this synod the allies met on an equality under the presidency of Athens. Among its first subjects of deliberation must have been the ratification of Aristides' assessment. Thucydides lays emphasis on the fact that in these meetings Athens as head of the league had no more than presidential authority, and the other members were called ἀνεπαγωγοί (allies), a word, however, of ambiguous meaning and capable of including both free and subject allies. The only other fact preserved by Thucydides is that Athens appointed a board called the Hellenotamiai (ῥηχωτά, steward) to watch over and administer the treasury of the league, which for some twenty years was kept at Delos, and to receive the contributions (φόροι) of the allies who paid in money.

The league was, therefore, specifically a free confederation of allies, not for the Ionian cities founded as a protection against the common danger which threatened the Aegean basin, and led by Athens in virtue of her predominant naval power as exhibited in the war against Xerxes. Its organization, adopted by the common synod, was the product of the new democratic ideal embodied in the Cleisthenic reforms, as interpreted by a just and moderate exponent. It is one of the few examples of free corporate action on the part of the ancient Greek cities, whose centrifugal yearning for independence so often proved fatal to the Hellenic world. It is, therefore, a profound mistake to regard the history of the league during the first twenty years of its existence as that of an Athenian empire. Thucydides expressly describes the predominance of Athens as ἰγγημενία (leadership), not as αρχηγία (empire), and the attempts made by Athenian orators during the second period of the Peloponnesian War to prove that the attitude of Athens had not altered since the time of Aristides are manifestly unsuccessful.

Of the first ten years of the league's history we know practically nothing, save that it was a period of steady, successful activity against the few remaining Persian strongholds in Thrace and the Aegean (Herod. i. 106-107, see ATHENS, Cimon). In these years the Athenian sailors reached a high pitch of training, and by their successes strengthened that corporate pride which had been born at Salamis. On the other hand, it naturally came to pass that certain of the allies became weary of incessant warfare and looked for a period of commercial prosperity. Athens, as the chosen leader, and supported no doubt by the synod, enforced the contributions of ships and money according to the assessment. Gradually the allies began to weary of personal service and persuaded the synod to accept a money commutation.

The Ionians were naturally averse from prolonged warfare, and in the prosperity which must have followed the final rout of the Persians and the freeing of the Aegean from the pirates (a very important feature in the league's policy) a money contribution was only a trifling burden. The result was, however, extremely hard for the allies, whose status in the league necessarily became lower in relation to that of Athens, while at the same time their military and naval resources correspondingly diminished. Athens became more and more powerful, and could afford to disregard the authority of the synod. Another new feature appeared in the employment of coercion against cities which desired to secede. Athens might quite fairly insist that the protection of the Aegean would become impossible if some of the chief islands were liable to be used as piratical strongholds, and further that it was only right that all should contribute in some way to the security which all enjoyed. The result was that, in the cases of Naxos and Thasos, for instance, the league's resources were employed not against the Persians but against recalcitrant Greek islands, and that the Greek ideal of separate autonomy was outraged. Shortly after the capture of Naxos (c. 467 B.C.) Cimon proceeded with a fleet of 300 ships (only 100 from the allies) to the south-western and southern coasts of Asia Minor. Having driven the
Persians out of Greek towns in Lycia and Caria, he met and routed the Persians on land and sea at the mouth of the Eury- 
medon in Pamphylia. In 465 after a siege of more than two years 
the Athenians captured Thasos, with which they had quarrelled 
on mining rights in the Strymon valley. It is said (Thuc. i. 101) 
that Thasos had appealed for aid to Sparta, and that the latter 
was prevented from responding only by earthquake and the 
Helot revolt. But this is both unproved and improbable. 
Sparta had so far no quarrel with Athens. Athens thus became 
mistress of the Aegean, while the synod at Delos had become 
practically, if not theoretically, powerless. It was at this time 
that Cimon (q.v.), who had striven to maintain a balance between 
Sparta, the chief military, and Athens, the chief naval power, 
was successfully attacked by Ephialtes and Pericles. During 
the ensuing years, apart from a brief return to the Cimonian policy, 
the resources of the league, or, as it has now become, the 
Athenian empire, were directed not so much against Persia 
as against Sparta, Corinth, Aegina and Boeotia. (See Athens; 
Sparta, &c.) A few points only need be dealt with here. The first 
years of the land war brought the Athenian empire to its zenith. 
Apart from Thessaly, it included all Greece outside the Pelo-
poness. At the same time, however, the Athenian expedition 
again failed to make any impression on the Persians, and for 
a time the Athenians returned to a Philo-Laconian policy, 
perhaps under the direction of Cimon (see Cimon and Pericles). 
Peace was made with Sparta, and, if we are to believe 4th-
century orators, a treaty, the Peace of Callias or of Cimon, was 
concluded between the Great King and Athens in 449 after the 
death of Cimon before the walls of Citium in Cyprus. The 
meaning of this so-called Peace of Callias is doubtful. Owing to 
the silence of Thucydides and other reasons, many scholars 
regard it as merely a cessation of hostilities (see Cimon and 
Callias, where authorities are quoted). At all events, it is 
significant of the success of the main object of the Delian League, 
the Athenians resigning Cyprus and Egypt, while Persia recog-
nized the freedom of the maritime Greeks of Asia Minor.

During this period the power of Athens over her allies had 
increased, though we do not know anything of the process by 
which this was brought about. Chios, Lesbos and Samos alone 
furnished ships; all the rest had contributed for a money pay-
ment. This meant that the synod was quite powerless. More-
over in 454 (probably) the changed relations were crystallized by 
the transference (proposed by the Samians) of the Delian list to 
Athens (Corp. Inscr. Attic. i. 260). Thus in 448 b.c. Athens 
was not only mistress of a maritime empire, but ruled over Megara, 
Boeotia, Phocis, Locris, Achaea and Thessaly, i.e. over so-called 
allies who were strangers to the old pan-Ionian assembly and 
and to the policy of the league, and was practically equal to Sparta 
on land. An important event must be referred probably to the 
year 451,—the law of Pericles, by which citizenship (including 
the right to vote in the Ecclesia and to sit on paid juries) was 
restricted to those who could prove themselves the children of an 
Athenian father and mother (Ἰχνοσεβίας κατοικίας). This measure 
must have had a detrimental effect on the allies, who thus saw 
themselves excluded still further from recognition as equal 
partners in a league (see Pericles). The natural result of all 
these causes was that a feeling of antipathy rose against Athens 
in the minds of those to whom autonomy was the breath of life, 
and the fundamental tendency of the Greeks to disruption was 
soon to prove more powerful than the forces at the disposal of 
Athens. The first to seize were the land powers of Greece proper 
(Thuc. ii. 10). The laws of Athens in Propontis (and on one occasion) to 
guarantee by supporting the democratic parties in the various 
states. Gradually the exiled oligarchs combined; with the defeat 
of Tolmides at Coronea, Boeotia was finally lost to the empire, 
and the loss of Phocis, Locris and Megara was the immediate 
sequel. Against these losses the retention of Euboia, Nisaea 
and Pegae was no compensation; the land empire was irre-
trievably lost.

The next important event is the revolt of Samos, which had 
qua rrelled with Miletus over the city of Priene. The Samians 
refused the arbitration of Athens. The island was conquered 
with great difficulty by the whole force of the league, and from the 
fact that the tribute of the Thracian cities and those in Helle-
sonic districts was increased between 439 and 436 we may 
probably infer that Athens had to deal with a widespread feeling 
of discontent about this period. It is, however, equally notice-
able on the one hand that the main body of the allies was not 
affected, and on the other that the Peloponnesean League on the 
advice of Corinth officially recognized the right of Athens to 
deal with her rebellious subject allies, and refused to give help to 
the Samians.

The succeeding events which led to the Peloponnesean War 
and the final disruption of the league are discussed in other 
articles. (See Athens: History, and Peloponnesean War.) Two 
important events alone call for special notice. The first is the 
rising of the allies' tribute in 435 b.c. by a certain Thudippus, 
presumably a huntsman of Cleon. The fact, though not 
mentioned by Thucydides, was inferred from Aristophanes 
(Wasps, 660), Andocides (de Pace, § 9), Plutarch (Aristides, 
c. 24), and pseudo-Andocides (Aelius. 111); it was proved by 
the discovery of the assessment list of 425-4 (Hicks and Hill, 
Inscr. 64). The second event belongs to 411, after the failure of the 
Sicilian expedition. In that year the tribute of the allies 
was a 4% tax on property and annually raised for a sea. 
This tax, which must have tended to equalize the Athenian 
merchants with those of the allied cities, probably came into force 
ggradually, for beside the new collectors called ἐκθεόμενοι we still 
find Hellenotamiae (C.I.A. iv. [5.] p. 34).

The Tribute.—Only a few problems can be discussed of the many 
which are raised by the insufficient and conflicting evidence at 
our disposal. In the first place there is the question of the 
tribute. Thucydides is almost certainly wrong in saying that 
the amount of the original tribute was 460 talents (about £16,000, 
00; this figure cannot have been reached for at least twenty, probably 
twenty years, when new members had been enrolled (Lycia, 
Caria, Eion, Lampacus). Similarly he is probably wrong, or at 
all events includes items of which the tribute lists take no account, 
when he says that it amounted to 600 talents at the beginning 
of the Peloponnesean War. The moderation of the assessment is 
shown not only by the fact that it was paid so long without 
objection, but also by the individual items. Even in 435 Naxos 
and Andros paid only 15 talents, while Athens had just raised 
an aresiphora (income tax) from her own citizens of 200 talents. 
Moreover we would not seem that a tribute which was less than 
the 5% tax of 411 could not have been unreasonable.

The number of tributaries is given by Aristophanes as 1000, 
but this is greatly in excess of those named in the tribute lists. 
Some authorities give 200; others put it as high as 290. The 
difficulty is increased by the fact that in some cases several towns 
were grouped together in one payment (συνεικοσις). These 
were grouped into five main geographical divisions (from 443 to 436; 
afterwards four, Caria being merged in Ionia). Each division 
was represented by two elective assessment commissioners 
(ταγαθείς), who assisted the Boule at Athens in the quadrennial 
division of the tribute. Each city sent in its own assessment 
before the ταγαθείς, who presented it to the Boule. If there 
was any difference of opinion the matter was referred to the Ecclesia 
for settlement. In the Ecclesia a private citizen might propose 
another assessment, or the case might be referred to the law 
courts. The records of the tribute are preserved in the so-called 
quota lists, which give the names of the cities and the proportion, 
one-sixth, of their several tributes, which was paid to Athens. 
Moreover it must be seen that a cleruscy (q.v.) was paid by members of a cleruscy (q.v.), as we find 
from the fact that the tribute of a city always decreased when 
a cleruscy was planted in it. This highly organized financial 
system must have been gradually evolved, and no doubt 
reached its perfection only after the treasury was transferred 
to Athens.

Government and Jurisdiction.—There is much difference of 
opinion among scholars regarding the attitude of Imperial Athens 
towards her allies. Grote maintained that on the whole 
the allies had little ground for complaint; but in so doing he rather 
seems to leave out of account the Greek's dislike of external
discipline. The very fact that the hegemony had become an empire was enough to make the new system highly offensive to the Greeks. No very strong argument can be based on the paucity of actual revolts. The indolent Ionians had seen the result of secession at Naxos and rebellion at Thasos; the Athenian fleet was perpetually on guard in the Aegean. On the other hand among the mainland cities revolt was frequent; they were ready to rebel καὶ παρὰ δὴναοὶ. Therefore, even though Athenian domination may have been highly salutary in its effects, there can be no doubt that the allies did not regard it with affection.

To judge only by the negative evidence of the decree of Aristoteles which records the terms of alliance of the second confederacy (below), we gather that in the later period at least of the first league's history the Athenians had interfered with the local autonomy of the allies in various ways—an inference which is confirmed by the terms of alliance which Athens imposed on Erythrae, Chalcis and Miletus. Though it appears that Athens made individual agreements with various states, and therefore that we cannot regard as general rules the terms laid down in those which we possess, it is undeniable that the Athenians planted garrisons under permanent Athenian officers (φορείσιαρχοι) in some cities. Moreover the practice among Athenian settlers of acquiring land in the allied districts must have been vexatious to the allies, and the more so as all important cases between Athenians and citizens of allied cities were brought to Athens. Even on the assumption that the Athenian dicasteries were scrupulously fair in their awards, it must have been peculiarly galling to the self-respect of the allies and inconvenient to individuals to be compelled to carry cases to Athens and Athenian juries. Furthermore we gather from the Aristoteles inscription and from the 4th-century orators that Athens imposed democratic constitutions on its allies; indeed Isocrates (Pan. 106) takes credit for Athens on this ground, and the charter of Erythrae confirms the view (cf. Arist. Politi., viii., vi. 9 1307 b 20; Thuc. viii. 21, 48, 63, 65). Even though we admit that Chios, Lesbos and Samos (up to 440) retained their oligarchic governments and that Selymbria, at a time (400 b.c.) when the empire was in extremis, was permitted to choose its own constitution, there can be no doubt that, from whatever motive and with whatever result, Athens did exercise over many of her allies an authority which extended to the most intimate concerns of local administration.

Thus the great attempt on the part of Athens to lead a harmonious league of free Greek states for the good of Hellas degenerated into an empire which proved intolerable to the autonomous states of Greece. Her failure was due partly to the commercial jealousy of Corinth working on the dull antipathy of Sparta, partly to the hatred of compromise and discipline which was fatally characteristic of Greece and especially of Ionian Greece, and partly also to the lack of tact and restraint shown by Athens and her representatives in her relations with the allies.

The Second League.—The conditions which led to the second Athenian or Delian Confederacy were fundamentally different, not only in virtue of the fact that the allies had learned from experience the dangers to which such a league was liable, but because the enemy was no longer an oriental power of whose future action there could be no certain anticipation, but Sparta, whose ambitious projects since the fall of Athens had shown that there could be no safety for the smaller states save in combination.

There can be no reasonable doubt that as soon as the Athenians began to recover from the paralysing effect of the victory of Lysander and the internal troubles in which they were involved by the government of the Thirty, their thoughts turned to the possibility of recovering their lost empire. The first step in the direction was the recovery of their sea-power, which was affected by the victory of Conon at Cnidus (August 304 b.c.). Gradually individual cities which had formed part of the Athenian empire returned to their alliance with Athens, until the Spartans had lost Rhodes, Cos, Nisyros, Teos, Chios, Mytilene, Ephesus, Erythrae, Lemnos, Imbros, Scyros, Eretria, Melos, Cythera, Carpathus and Delos. Sparta had only Sestos and Abydos of all that she had won by the battle of Agesipatami. At the same time no systematic constructive attempt at a renewal of empire can as yet be detected. Athenian relations were with individual states only, and the terms of alliance were various. Moreover, whereas Persia had been for several years aiding Athens against Sparta, the revolt of the Athenian ally Evagoras (413) of Cyprus set them at enmity, and with the secession of Ephesus, Chidus and Samos in 301 and the civil war in Rhodes, the star of Sparta seemed again to be in the ascendant. But the whole position was changed by the successes of Thrasylulus, who brought over the Odrysian king Medocus and Seuthes of the Propontis to the Athenian alliance, set up a democracy in Byzantium and reimposed the old 10% duty on goods from the Black Sea. Many of the island towns subsequently came over, and from inscriptions at Clazomenae (C.I.A. ii. 148) and Thasos (C.I.A. iv. 116) we learn that Thrasylulus evidently was deliberately aiming at a renewal of the empire, though the circumstances leading to his death at Aspendus when seeking to raise money suggest that he had no general backing in Athens.

The peace of Antalcidas or the King's Peace (see ANTALCIDAS; SPARTA) in 386 was a blow to Athens in the interests of Persia and Sparta. Antalcidas compelled the Athenians to give their assent to it only by making himself master of the Hellespont by stratagem with the aid of Dionysius the Elder of Syracuse. By this peace all the Greek cities on the mainland of Asia with the islands of Cyprus and Clazomenae were recognized as Persian, all other cities except Imbros, Lemnos and Scyros as autonomous. Directly, this arrangement prevented an Athenian empire; indirectly, it caused the sacrificed cities and their kinsmen on the islands to look upon Athens as their protector. The gross selfishness of the Spartans, herein exemplified, was emphasized by their capture of the Theban citadel, and, after their expulsion, by the raid upon Attica in time of peace by the Spartan Spohrias, and his immunity from punishment at Sparta (summer of 378 b.c.). The Athenians at once invited their allies to a conference, and the Second Athenian Confederacy was formed in the archonship of Nausinicus on the basis of the famous decree of Aristoteles. Those who attended the conference were probably Athens, Chios, Mytilene, Methymna, Rhodes, Byzantium, Thebes, the latter of which joined Athens soon after the Spohrias raid. In the spring of 377 invitations were sent out to the maritime cities. Some time in that year Tenedos, Chios, Chalcis in Euboea, and probably the Euboean cities Eretria, Carystus and Arethusa gave in their adherence, followed by Perinthos, Pparepentes, Scythians and other maritime cities.

At this point Sparta was roused to a sense of the significance of the new confederacy, and the Athenian corn supply was threatened by a Spartan fleet of sixty triremes. The Athenians immediately fitted out a fleet under Chabrias, who gained a decisive victory over the Spartans between Naxos and Paros (battle of Naxos 375 b.c.), both of which were added to the league. Proceeding northwards in 375 Chabrias brought over a large number of the Thracean towns, including Abdera, Thasos and Samothrace. It is interesting to notice that a garrison was placed in Abdera in direct contravention of the terms of the new confederacy (Meyer, Gesch. d. Alt., v. 394). About the same time the successes of Timotheus in the west resulted in the addition to the league of Corcyra and the cities of Cephalenia, and his moderation induced the Acarnanians and Alcetas, the Molossian king, to follow their example. Once again Sparta sent out a fleet, but Timotheus in spite of financial embarrassment held his ground. By this time, however, the alliance between Thebes and Athens was growing weaker. In 372, when Athens was being short of money, she concluded a peace with Sparta (probably in July 374), by which the peace of Antalcidas was confirmed and the two states recognized each other as mistress of sea and land respectively. Trouble, however, soon arose over Zacynthus, and the Spartans not only sent help to the Zacynthian oligarchs but even besieged Corcyra (373). Timotheus was sent to relieve the island, but shortness of money compelled him to search for new allies, and he spent the summer of 373 in persuading Jason of Pherean (if he had not
already joined), and certain towns in Thrace, the Chersonese, the Proponitis and the Aegean to enrol themselves. This delay in sending help to Corcyra was rightly or wrongly condemned by the Athenians, who dismissed Timotheus in favour of Iphicrates. The expedition which followed produced negative successes, but the absence of any positive success and the pressure of financial difficulty, coupled with the defection of Jason (probably before 371), and the high-handed action of Thebes in destroying Plataea (373), induced Athens to renew the peace with Sparta which Timotheus had broken. With the support of Persia an agreement was made by a congress at Sparta on the basis of the autonomy of the cities, Amphipolis and the Chersonese being granted to Athens. The Thebans at first accepted the terms, but on the day after, realizing that they were thus balked of their pan-Boeotian ambition, withdrew and finally severed themselves from the league.

The peace of 371 may be regarded as the conclusion of the first distinct period in the league's existence. The original purpose of the league—the protection of the allies from the ambitions of Sparta—was achieved. Athens was recognized as mistress of the sea; Sparta as the chief land power. The inherent weakness of the coalition had, however, become apparent. The enthusiasm of the allies (numbering about seventy) waned rapidly before the financial exigencies of successive campaigns, and it is abundantly clear that Thebes had no interest save the extension of her power in Boeotia. Though her secession, therefore, meant very little loss of strength, there were not wanting signs that the league was not destined to remain a power in the land.

The remaining history may be broken up into two periods, the first from 371 to 357, the second from 357 to 338. Throughout these two periods, which saw the decline and final dissolution of the alliance, there is very little specific evidence for its existence. The events seem to belong to the histories of the several cities, and examples of corporate action are few and uncertain. None the less the known facts justify a large number of inferences as to the significance of events which are on the surface merely a part of the individual foreign policy of Athens.

Period 371-357.—The first event in this period was the battle of Leuctra (July 371), in which, no doubt to the surprise of Athens, Thebes temporarily asserted itself as the chief land power in Greece. To counterbalance the new power Athens very rashly plunged into Peloponnesian politics with the ulterior object of inducing the states which had formerly recognized the hegemony of Sparta to transfer their allegiance to the Delian League. It seems that all the states adopted this policy with the exception of Sparta (probably) and Elis. The policy of Athens was mistaken for two reasons: (1) Sparta was not entirely humiliated, and (2) Sparta, though the land powers of Peloponnesus was incautiously dangerous, inasmuch as it involved Athens in enterprises which could not awoke the enthusiasm of her maritime allies. This new coalition naturally alarmed Sparta, which at once made overtures to Athens on the ground of their common danger from Thebes. The alliance was concluded in 369. About the same time Iphicrates was sent to take possession of Amphipolis according to the treaty of 371. Some success in Macedonia roused the hostility of Thebes, and the subsequent attempts on Amphipolis caused the Chaonians to declare against the league. It would appear that the old suspicion of the allies was now thoroughly awakened, and we find Athens making great efforts to conciliate Mytilene by honorable decrees (Hicks and Hill, 109). This suspicion, which was due primarily, no doubt, to the agreement with Sparta, would find confirmation in the subsequent exchange of compliments with Dionysius I. of Syracuse, Sparta's ally, who with his sons received the Athenian citizenship. It is not clear that the allies officially approved this new friendship; it is certain that it was actually distasteful to them. The same disliking would be roused by the Athenian alliance with Alexander of Pherae (368-367). The maritime allies naturally had no desire to be involved in the quarrels of Sicily, Thessaly and the Peloponnesse.

In 367 Athens and Thebes sent rival ambassadors to Persia, with the result that Athens was actually ordered to abandon her claim to Amphipolis, and to remove her navy from the high seas. The claim to Amphipolis was subsequently affirmed, but the Greek states declined to obey the order of Persia. In 366 Athens lost Orus, a blow which she endeavoured to repair by forming an alliance with Arcadia and by an attack on Corinth. At the same time certain of the Peloponnesian states made peace with Thebes, and some hold that Athens joined this peace (Meyer, Gesch. d. Alt. v. 449). Timotheus was sent in 366-365 to make a demonstration against Persia. Finding Samos in the hands of Cyrothamis, a servant of the satrap Tigranes, he laid siege to it, captured it after a ten months' siege and established a cleruchy. Though Samos was not apparently one of the allies, this latter action could not but remind the allies of the very dangers which the second confederacy had set out to avoid.

The next important event was the serious attempt on the part of Epaminondas to challenge the Athenian naval supremacy. Though Timotheus held his ground the confederacy was undoubtedly weakened. In 362 Athens joined in the opposition to the Theban expedition which ended in the battle of Mantinea (July). In the next year the Athenian generals failed in the north in their attempt to control the Hellespont. In Thessaly Alexander of Pherae became hostile and after several successes even attacked the Peiraeus. Chares was ordered to make reprisals, but instead sailed to Corcyra, where he made the mistake of siding with the oligarchs. The last event of the period was a success, the recovery of Euboea (357), which was once more added to the league.

During these fourteen years the policy of Athens towards her maritime allies was, as we have seen, shortsighted and inconsistent. Alliances with various land powers, and an inability to understand the true relations which alone could unite the league, combined to alienate the allies, who could discover no reason for the expenditure of their contributions on protecting Sparta or Corinth against Thebes. The Συνέδριον of the league is found taking action in several instances, but there is evidence (cf. the expedition of Epaminondas in 361) that there was ground for suspecting disloyalty in many quarters. On the other hand, though the Athenian fleet became stronger and several cities were captured, the league itself did not gain any important voluntary adherents. The generals were compelled to support their forces by plunder or out of their private resources, and, frequently failing, diverted their efforts from the pressing needs of the allies to purely Athenian objects.

Period 357-338.—The latent discontent of the allies was soon fanned into hostility by the intrigues of Mausolus, prince of Caria, who was anxious to extend his kingdom. Chios, Rhodes, Cos, Byzantium, Erythrae and probably other cities were in revolt by the spring of 356, and their attacks on loyal members of the confederacy compelled Athens to take the offensive. Chabrias had already been killed in an attack on Chios in the previous autumn, and the fleet was under the command of Timotheus, Iphicrates and Chares, who sailed against Byzantium. The enemy sailed north from Samos and in a battle off Embata (between Erythrae and Chios) defeated Chares, who, without the consent of his colleagues, had ventured to engage them in a storm. The more cautious generals were accused of corruption in not supporting Chares. Iphicrates was acquitted and Timotheus condemned. Chares sought to replenish his resources by aiding the Phrygian satrap Artabazus against Artaxerxes Ochus, but a threat from the Persian court caused the Athenians to recall him, and peace was made by which Athens recognized the independence of the revolted towns. The league was further weakened by the death of Timotheus, who died by 355 was reduced to Athens, Euboea and a few islands. By this time, moreover, Philip II of Macedonia had begun his career of conquest, and had shatter an embryonic alliance between the league and certain princes of Thrace (Cetripori), Paeonia (Lyppeius) and Illyria (Grabus). In 355 his advance temporarily ceased, but, as we learn from Isocrates and Xenophon, the financial exhaustion of the league was such that its destruction was only a matter of time. Resuming operations in 354, Philip, in spite of temporary checks at the hands of Chares, and the spasmodic opposition of a
few barbarian chiefs, took from the league all its Thracian and Macedonian cities (Aberd, Maronea, Neapolis, Methone). In 332–351 Philip actually received help from former enemies of the confederacy. In 351 Chares and Philip were sent to the league, and we find that the contributions of the Lesbian cities were assigned to them for supplies, but no successes were gained. In 340 Euboea and Olynthus were lost to the league, of which indeed nothing remained but an empty form, in spite of the facts that the expelled Olynthians appealed to it in 348 and that Mytilene rejoined in 347. In 346 the peace of Philocrates was made between the league and Philip on terms which were accepted by the Athenian Boule. It is very remarkable that, in spite of the powerlessness of the confederacy, the last recorded event in its history is the steady loyalty of Tenedos, which gave money to Athens about 340 (Hicks and Hill, 146). The victory of Philip at Chaeronea in 338 finally destroyed the league.

In spite of the precautions taken by the allies to prevent the domination of Athens at their expense, the policy of the league was almost throughout directed rather in the interests of Athens. Founded with the specific object of thwarting the ambitious designs of Sparta, it was plunged by Athens into enterprises of an entirely different character which exhausted the resources of the allies without benefiting them in any respect. There is no record of any efforts to aid Athens, which was held to their allegiance solely by the superior force of the Athenian navy. The few instances of its action show that the Lokóbos was practically only a tool in the hands of Athens.

**The Second League.**—The chief modern works are G. Busolt, “Der zweite athenische Bund” in *Neue Jahrbücher für classische Philologie* (suppl. vol., 1873–1875), pp. 614–641, and F. H. Marshall, *The Second Athenian Confederacy* (1895), one of the Cambridge Historical Essays (Nos. xiii.). The latter is based on Busolt’s monograph and includes subsequent epigraphic evidence and includes a full list of authorities. For important articles see *Oxford Living Philosophers*, *Das Zeitalter der Inscriptions*, *Atallia*, vol. ii. pt. 5. The meagre data given by ancient writers are collected by Busolt and Marshall.

**(J. M. M.)**

**DELILLE, CLÉMENT PHILIBERT LÉO** (1836–1891), French composer, was born at Saint Germain du Val on the 21st of February 1836. He studied at the Paris Conservatoire under Adolphe Charles Adam, through whose influence he became accompanist at the Théâtre Lyrique. His first essay in dramatic composition was his *Deux sous de charbon* (1833), and during several years he produced a number of opérettes. His cantata *Alger* was heard at the Paris opera in 1855. Having become second chorus master at the Grand Opéra, he won the music of a ballet with *La Reine Margot* for this season, in collaboration with Minkous, a Polish composer. *La Source* was produced with great success in 1856. The composer returned to the operetta style with *Maldruou dans sa tenue*, written in collaboration with Georges Bizet, Émile Jonas and Legoux, and given at the Théâtre of the Athénée in 1867. Two years later came *L’Écosais de Chantou*, a one-act piece, and *La Cour du roi Pétouë*, a three-act opera-bouffe. The ballet *Coppélia* was produced at the Grand Opéra on the 25th of May 1870 with enormous success.

Delille gave up his post as second chorus master at the Grand Opéra in 1871 when he married the daughter of Madameissel Demain, formerly an actress at the Comédie Française. In this year he published a collection of graceful melodies including *Myrio, Les Filles de Cadix, Bonjour, Süsson* and others. His first important dramatic work was *Le Roi d’Ari*, a charming comic opera, produced on the 11th of May 1873 at the Opéra Comique. Three years later, on the 14th of June 1876, *Sylvia*, a ballet in three acts, one of the composer’s most delightful works, was produced at the Grand Opéra. This was followed by *La Mort d’Orphee*, a grand scena produced at the Troadédon concerts in 1878; by *Jean de Nivelle*, a three-act opera brought out at the Opéra Comique on the 8th of March 1880, and by *Lakmé*, an opera in three acts produced at the same theatre on the 14th of April 1883. *Lakmé* has remained his most popular opera. The composer died in Paris on the 13th of February 1893, leaving Kahsya, a four-act opera, in an unfinished state. This work was completed by E. Guiard, and produced at the Opéra Comique on the 21st of March 1892. In 1872 Delille became a chevalier of the Legion of Honour; in 1881 he became a professor of advanced composition at the Conservatoire; in 1884 he took the place of Victor Massé at the Institut de France.

Leo Delilah was a typically French composer. His music is light, graceful and refined. He excelled in ballet music, and *Sylvie* may well be considered a masterpiece. His operas are constructed on a conventional pattern. The harmonic texture, however, is modern, and the melodic invention abundant, while the orchestral treatment is invariably excellent.

**DELILLE, JACQUES** (1738–1813), French poet, was born on the 22nd of June 1738 at Aigue-Perse in Auvergne. He was an illegitimate child, and was descended from his mother by the chancellor de l’Hôpital. He was educated at the college of Lisieux in Paris and became an elementary teacher. He gradually acquired a reputation as a poet by his epistles, in which things are not called by their ordinary names but are hinted at by elaborate periphrases. Sugar becomes "le miel américa que du suc des roseaux exprima l’Africain." The publication (1769) of his translation of the *Georgics* of Virgil made him famous. Voltaire recommended the poet for the next vacant place in the Academy. He was at once elected a member, but was not admitted until 1774 owing to the opposition of the king, who alleged that he was too young. In *Les Jardins*, *l’art d’embellir les paysages* (1782) he made good his pretensions as an original poet. In 1786 he made a journey to Constantinople in the train of the ambassador M. de Choiseul-Goufrin.

Delille had become professor of Latin poetry at the Collège de France, and abbot of Saint-Sévérin, when the outbreak of the Revolution reduced him to poverty. He purchased his personal safety by professing his adherence to revolutionary doctrine, but eventually quitted Paris, and retired to St Die, where he completed his translation of the *Aeneid.* He emigrated first to Basel and then to Glairesse in Switzerland. There he finished his *Homme des champs*, and his poem on the *Trois règles de de nature*. His next place of refuge was in Germany, where he composed his *La Prisette*; and finally, he passed some time in London, chiefly employed in translating *Paradise Lost*. In 1802 he was able to return to Paris, where, although nearly blind, he resumed his professorship and his chair at the Academy, but lived in retirement. He fortunately did not outlive the vogue of the descriptive poems which were his special province, and died on the 1st of May 1813.

Delille left behind him little prose. His preface to the translation of the *Georgics* is an able essay, and contains many excellent hints on the art and difficulties of translation. He wrote the article "La Broyère" in the *Biographie universelle*. The following is the list of his poetic works:—*Les Géorgiques de Virgile, traduites en vers français* (Paris, 1790, 1792, 1785, 1809); *Les Jardins*, en quatre chants (1780; new edition, Paris, 1801);
L'Homme des champs, ou les Géorgiques françaises (Strassburg, 1802); Poésies fugitives (1802); Didymrame sur l'immortalité de l'âme, suivit du passe de Saint Gothard, poème traduit de l'Anglais de Madame la duchesse de Devonshire (1802); La Piété, poème en quatre chants (Paris, 1802); L'Énigme de Virgile, traduite en vers français (4 vols., 1804); Le Paradis perdu (3 vols., 1804); L'Imagination, poème en huit chants (2 vols., 1806); Les trois règles de la nature (2 vols., 1808); La Conversation (1812). A collection given under the title of Poésies diverses (1810) was disavowed by Delille.

His Œuvres (16 vols.) were published in 1824. See Sainte-Beuve, Portraits littéraires, vol. ii.

**DELIRIUM** (a Latin medical term for madness, from delirare, to be mad, literally to wander from the lira, or furrow), a temporary form of brain disorder, generally occurring in conjunction with some special form of bodily disease. It may vary in intensity from slight and occasional wandering of the mind and incoherence of expression, to fixed delusions and violent maniacal excitement, and again it may be associated with more or less of coma or insensibility. (See INSANITY, and NEUROPATHOLOGY.) Delirium is apt to occur in most diseases of an acute nature, such as fevers or inflammatory affections, in injuries affecting the brain, in blood diseases, in conjunction of exhaustion, and as the result of certain drugs, such as opium, Indian hemp, belladonna, chloroform and alcohol.

Delirium tremens is one of a train of symptoms of what is termed in medical nomenclature acute alcoholism, or excessive indulgence in alcohol. It must, however, be observed that this disorder, although arising in this manner, rarely comes on as the result of a single debauch in a person unaccustomed to the abuse of stimulants, but generally occurs in cases where the nervous system has been already subjected for a length of time to the poisonous action of alcohol, so that the complaint might be more properly regarded as acute supervening on chronic alcoholism. It is equally to be borne in mind that many habitual drunkards never suffer from delirium tremens.

It was long supposed, and is indeed still believed by some, that delirium tremens only comes on when the supply of alcohol has been suddenly cut off; but this view is now generally rejected, and there is abundant evidence to show that the attack comes on while the patient is still continuing to drink. Even in those cases when it occurs after a cessation from drinking and the seizure, it will be found that in the interval the premonitory symptoms of delirium tremens have shown themselves, one of which is aversion to drink as well as food—the attack being in most instances preceded by marked derangement of the digestive functions. Occasionally the attack is precipitated in persons predisposed to it by the occurrence of some acute disease, such as pneumonia, by accidents, such as burns, also by severe mental strain, and by the deprivation of food, even where the supply of alcohol is less than would have been likely to produce it otherwise. Where, on the other hand, the quantity of alcohol taken has been very large, the attack is sometimes ushered in by fits of an epilepticiform character.

One of the earliest indications of the approaching attack of delirium tremens is sleeplessness, any rest the patient may obtain being troubled by unpleasant or terrifying dreams. During the day there is observed a certain restlessness and irritability of manner, with trembling of the hands and a thick or tremulous articulation. The skin is perspiring, the countenance oppressed-looking and flushed, the pulse rapid and feeble, and there is evidence of considerable bodily prostration. These symptoms increase each day and night for a few days, and then the characteristic delirium is superadded. The patient is in a state of mental confusion, talks incessantly and incoherently, has a distressed and agitated or perplexed appearance, and a vague notion that he is pursued by some one seeking to injure him. His delusions are usually of transient character, but he is constantly troubled with visual hallucinations in the form of disagreeable animals or insects which he imagines he sees all about him. He looks suspiciously around him, turns over his pillows, and ransacks his bedclothes for some fancied object he supposes to be concealed there. There is constant restlessness, a common form of delusion being that he is not in his own house, but imprisoned in some apartment from which he is anxious to escape to return home. In these circumstances he is ever wishing to get out of bed and out of doors, and, although in general he may be persuaded to return to bed, he is soon desiring to get up again. The trembling of the muscles from which the name of the disease is derived is a prominent but not invariable symptom. It is most marked in the muscles of the hands and arms and in the tongue. The character of the delirium is seldom wild or noisy, but is much more commonly a combination of busy restlessness and indefinite fear. When spoken to, the patient can answer correctly enough, but immediately thereafter relapses into his former condition of incoherence. Occasionally maniacal symptoms develop themselves, the patient becoming dangerously violent, and the case thus assuming a much graver aspect than one of simple delirium tremens.

In most cases the symptoms undergo abatement in from three to six days, the cessation of the attack being marked by the occurrence of sound sleep, from which the patient awakes in his right mind, although in a state of great physical prostration, and in great measure if not entirely oblivious of his condition during his illness.

Although generally the termination of an attack of delirium tremens is in recovery, it occasionally proves fatal by the supervision of coma and convulsions, or acute mania, or by exhaustion, more especially when any acute bodily disease is associated with the attack. In certain instances delirium tremens is but the beginning of serious and permanent impairment of intellect, as is not infrequently observed in confirmed drunkards who have suffered from frequent attacks of this disease. The theory once widely accepted, that delirium tremens was the result of the too sudden breaking off from indulgence in alcohol, led to its treatment by regular and often large doses of stimulants, a practice fraught with mischievous results, since however much the delirium appeared to be thus calmed for the time, the continuous supply of the poison which was the original source of the disease inflicted serious damage upon the brain, and led in many instances to the subsequent development of insanity. The former system of prescribing large doses of opium, with the view of procuring sleep at all hazards, was no less pernicious. To prevent a relapse, a rigid diet, the abandonment of all tobacco, and mechanical restraint of the patient was the common practice.

The views of the disease which now prevail, recognizing the delirium as the effect at once of the poisonous action of alcohol upon the brain and of the want of food, encourage reliance to be placed for its cure upon the entire withdrawal, in most instances, of stimulants, and the liberal administration of light nutriment, in addition to quietness and gentle but firm control, without mechanical restraint. In mild attacks this is frequently all that is required. In more severe cases, where there is great restlessness, sedatives have to be resorted to, and many substances have been recommended for the purpose. Opiates administered in small quantity, and preferably by hypodermic injection, are undoubtedly of value; and chloral, either alone or in conjunction with bromide of potassium, often answers even better. Such remedies, however, should be administered with great caution, and only under medical supervision.

Stimulants may be called for where the delirium assumes the low or adynamic form, and the patient tends to sink from exhaustion as if in coma, the delirium being complicated with some other disease. Such cases are, however, in the highest degree exceptional, and do not affect the general principle of treatment already referred to, which inculcates the entire withdrawal of stimulants in the treatment of ordinary attacks of delirium tremens.

**DELISLE, JOSEPH NICOLAS** (1688-1768), French astronomer, was born at Paris on the 4th of April 1688. Attracted to astronomy by the solar eclipse of the 12th of May 1706, he obtained permission in 1710 to lodge in the dome of the Luxembourg, procured some instruments, and there observed the total eclipse of the 22nd of May 1724. He proposed in 1715 the "diffraction theory" of the sun's corona, visited England and was received
into the Royal Society in 1724, and left Paris for St Petersburg on a summons from the empress Catherine, towards the end of 1725. Having founded an observatory there, he returned to Paris in 1747, was appointed geographical astronomer to the naval department with a salary of 120 livres, and installed an observatory in the Hôtel Cluny. Charles Messier and J. J. Lalanne were among his pupils. He died of apoplexy at Paris on the 12th of September 1768. Delisle is chiefly remembered as the author of a method for observing the transits of Venus and Mercury by instantaneous contacts. First proposed by him in a letter to J. Cassini in 1743, it was afterwards perfected, and has been extensively employed. As a preliminary to the transit of Mercury in 1743, which he personally observed, he issued a map of the world showing the varied circumstances of its occurrence. Besides many papers communicated to the academy of sciences, of which he became a member in 1714, he published Mémoires pour servir à l'histoire et au progrès de l'astronomie (St. Petersburg, 1738), in which he gave the first method for determining the heliocentric co-ordinates of sun-spots; Mémoire sur les nouvelles découvertes au nord de la mer du sud (Paris, 1752), &c.

See Mémoires de l'acad. des sciences (Paris, 1768), Histoire, p. 167 (G. de Fouchy); J. B. J. Delambre, Hist. de l'astronomie au XVIIIe siècle, pp. 319, 333; Max. Marie, Hist. des sciences, vii. 1754, Bibl. astr., p. 385; and Le Néerographe des hommes illustres de France (1770). The records of Delisle's observations at St Petersburg are preserved in manuscript at the Pulkowa observatory. A report upon them was presented to the St Petersburg academy of sciences by O. Setterberg (1758), and some relating to his projected voyage to the south were discussed by Carl Linsner in 1846. See also S. Newcomb, Washington Observations for 1875, app. ii. pp. 176-189. (A. M. C.)

DELISLE, LOUPOL D VICTOR (1826— ), French bibliophile and historian, was born at Valognes (Manche) on the 24th of October 1826. At the École des Chartres, where his career was remarkably brilliant, his valedictory thesis was an Essai sur les revenus publics en Normandie au XIIe siècle (1849), and it was to the history of his native province that he devoted his early works. Of these the Études sur la condition de la classe agricole et l'état de l'agriculture en Normandie au moyen âge (1851), condensing an enormous mass of facts drawn from the local archives, was reprinted in 1905 without change, and remains authoritative. In November 1852 he entered the manuscript department of the Bibliothèque Impériale (Nationale), of which in 1874 he became the official head in succession to Jules Tascchereau. He was already known as the compiler of several invaluable inventories of its manuscripts. When the French government decided on printing a general catalogue of the printed books in the Bibliothèque Impériale, Delisle was made one of the three responsible for this promised undertaking, and took an active part in the work; in the preface to the first volume (1897) he gave a detailed history of the library and its management. Under his administration the library was enriched with numerous gifts, legacies and acquisitions, notably by the purchase of a part of the Ashburnham MSS. Delisle proved that the bulk of the MSS. of French origin which Lord Ashburnham had bought in France, particularly those bought from the bookseller Barrois, had been purloined by Count Liroz, inspector-general of libraries under King Louis Philippe, and he procured the repurchase of the MSS. for the library, afterwards preparing a catalogue of them entitled Catalogue des MSS. des fonds Libri et Barrois (1888), the preface of which gives the history of the whole transaction. He was elected member of the Académie des Inscrptionis et Belles Lettres in 1859, and became a member of the staff of the Recueil des historiens de la France, collaborating in vols. xxii. (1865) and xxiii. (1870) and editing vol. xxiv. (1904), which is valuable for the social history of France in the 14th century. The jubilee of his fifty years' association with the Bibliothèque Nationale was celebrated on the 5th of March 1903. After his retirement (February 21, 1905) he brought out in two volumes a catalogue and description of the printed books now in the MSS. in the Musée Condé at Chantilly, left by the duc d'Aumale to the French Institute. He produced many valuable official reports and catalogues and a great number of memoirs and monographs on points connected with palaeography and the study of history and archaology (see his Mélanges de paléographie et de

bibiographie (1880) with atlas; and his articles in the Album paléographique (1887). Of his purely historical works special mention must be made of his Mémoire sur les actes d'Innocent III (1857), and his Mémoires sur les opérations financières des Templiers (1888), a collection of documents of the highest value for economic history. The thirty-second volume of the Histoire littéraire de la France, which was partly his work, is of great importance for the study of 13th and 14th century Latin chronicles. Delisle was undoubtedly the most learned man in Europe with regard to the middle ages; and his knowledge of diplomatics, palaeography and printing was profound. His output of work, in catalogues, &c., was enormous, and his services to the Bibliothèque Nationale in this respect cannot be overestimated. His wife, a daughter of Eugène Burnouf, was for many years his collaborator.

The Bibliographie des travaux de L. Delisle (1902), by Paul Lacombe, may be consulted for a full list of his numerous works.

DELTZSCH, FRANZ (1813-1890), German Lutheran theologian and orientalist, of Jewish descent, was born at Leipzig on the 23rd of February 1813. He studied theology and oriental languages in the university of his native town, and in 1830 was appointed professor ordinarius of theology at Erlangen, where the school of theologians became almost as famous as that of Tübingen. In 1867 he accepted a call to Leipzig, where he died on the 4th of March 1890. Delitzsch was a strict Lutheran. By the law of the confessional his name was deleted, he said in 1888; "folding ourselves in it, let us die." (T. B. Cheyne, Founders, p. 190.) Greatly interested in the Jews, he longed ardently for their conversion to Christianity; and with a view to this he edited the periodical Saat auf Hofnung from 1863, revived the "Institutum Judaicum" in 1880, founded a Jewish missionary college for the training of theologians, and translated the New Testament into Hebrew. He acquired such a mastery of post-biblical, rabbinic and talmudic literature that he has been called the "Christian Talmudist." Though never an advanced critic, his article on Daniel in the second edition of Herzog's Realencyclopädie, his New Commentary on Genesis and the fourth edition of his Isaiah show that as years went on his sympathy with higher criticism increased—so much so indeed that Prof. Cheyne has included him among its founders.

His son, FRIEDRICH DELTITSCH (b. 1850), became well known as professor of Assyriology in Berlin, and the author of many books of great research and learning, especially on oriental philology. Among other works of importance he wrote Wo lag das Paradies (1881), and Babel und Bibel (1902, 1903, Eng. trans. 1903).

DELTZSCH, a town of Germany, in the Prussian province of Saxony, on the Lober, an affluent of the Mulde, 12 m. north of Leipzig at the junction of the railways, Bitterfield-Leipzig and Halle-Cottbus. Pop. (1901) 10,479. Its public buildings comprise an old castle of the 14th century now used as a female penitentiary, a Roman Catholic and three Protestant churches, a normal college (Schulhallenseminar) established in 1873 and several other educational institutions. Besides Kuhknau, a peculiar kind of beer, it manufactures tobacco, cigars, shoes, and horsey; and coal-mining is carried on in the neighbourhood.
It was the birthplace of the naturalist Christian Gottfried Ehrenberg (1707–1856), and the political economist Hermann Schulze-Delitzsch (1806–1883), to the latter of whom a statue has been erected. Originally a settlement of the Sorbian Wends, and in the 12th century part of the possessions of the bishops of Merseburg, Delitzsch ultimately passed to the Saxe-Merseburg family, and, on their extinction in 1738, was incorporated with Electoral Saxony.

DELIUS, NIKOLAUS (1813–1888), German philologist and Shakespearean scholar, was born at Bremen on the 10th of September 1813. He was educated at Bonn and Berlin, and took the degree of doctor in philosophy in 1838. After travelling for some time in England, France and Germany, he returned to Bonn in 1846, where in 1855 he was appointed professor of Sanskrit, Provençal and English literature, a post he held until his death, which took place at Bonn on the 18th of November 1888. His greatest literary achievement was his scholarly edition of Shakespeare (1854–1861). He also edited Wace's St Nicholas (1850), a volume of Provençal songs (1853), and published a Shakespeare-Lexikon (1852). His original works include: Über das englische Theaterwesen zu Shakesperes Zeit (1853), Gedichte (1853), Der Sassindische Dialekt des dreizehnten Jahrhunderts (1858), and Abhandlungen zu Shakspere (two series, 1878 and 1888). As a critic of Shakespeare's text he stands in the first rank.

DELLA BELLA, STEFANO (1610–1664), Italian engraver, was born at Florence. He was apprenticed to a goldsmith; but some prints of Callot having fallen into his hands, he began to turn his attention entirely towards engraving, and studied the art under Canta Gallina, who had also been the instructor of Callot. By the liberty of Lorenzo de' Medici he was enabled to spend three years in study at Rome. In 1642 he went to Paris, where Cardinal Richelieu engaged him to go to Arras and make drawings of the siege and taking of that town by the royal army. After returning to Italy, he spent considerable time at Paris he returned to Florence, where he obtained a pension from the grand duke, whose son, Cosmo, he instructed in drawing. His productions were very numerous, amounting to over 1400 separate pieces.

DELLA CASA, GIOVANNI (1503–1550), Italian poet, was born at Mugillo, in Tuscany, in 1503. He studied at Bologna, Florence and Rome, and by his learning attracted the patronage of Alexander Farnese, who, as Pope Paul III., made him nuncio to Florence, where he received the honour of being elected a member of the celebrated academy, and then to Naples, where his oratorical ability brought him considerable success. His reward was the archbishopric of Benevento, and it was believed that it was only his openly licentious poem, Capitoli del forno, and the fact that the French court seemed to desire his elevation, which prevented him from being raised to a still higher dignity. He died in 1550. Casa is chiefly remarkable as the leader of a reaction in lyric poetry against the universal imitation of Petrarch, and as the originator of a style, which after a short and elaborate period, was more nervous and majestic than that which it replaced. His prose writings gained great reputation in their own day, and long afterwards, but are disfigured by apparent straining after effect, and by frequent puerility and circumlocution. The principal are—in Italian, the famous Il Galateo (1538), a treatise of manners, which has been translated into several languages, and in Latin, De officiis, and translations from Thucydid, Plato and Aristotle.

A complete edition of his works was published at Florence in 1707, to which is prefixed a life by Casotti. The best edition is that of Venice, 1758.

DELLA COLLE, RAFFAELINO, Italian painter, was born at Colle, near Borgo San Sepolcro, in Tuscany, about 1490. A pupil of Colle, whom he is held to have assisted in the Farnesina and the Vatican, Della Colle, after his master's death, was the assistant of his chief scholar, Giulio Romano, at Rome and afterwards at Mantua. In 1539, on the occasion of the entry of Charles V. into Florence, he took service in that city under Vasari. In his later years Della Colle resided at Borgo San Sepolcro, where he kept a school of design; among his many pupils of note may be mentioned Gherardini and Vecchi. His works, which are to be found at Urbino, at Perugia, at Perugia and at Gubbio, are fine examples of the Roman school of Raphael. The best are a painting of the Almighty supported by angels, a Resurrection and an Assumption, all preserved in churches at Borgo San Sepolcro.

DELLA GHERARDESCA, UGOLINO (c. 1220–1289), count of Donoratico, was the head of the powerful family of Gherardesca, the chief Ghibelline house of Pisa. His alliance with the Visconti, the leaders of the Guelph faction, through the marriage of his sister with Giovanni Visconti, judge of Gallura, aroused the suspicions of his party, and the Ghibelines being then predominant in Pisa, the disorders in the city caused by Ugolino and Visconti in 1271–1274 led to the arrest of the former and the banishment of the latter. Visconti died soon afterwards, and Ugolino, no longer regarded as dangerous, was liberated and banished. But he immediately began to intrigue with the Guelph town open to Pisa, and with the help of Charles I. of Anjou (q.v.) attacked his native city and forced it to make peace on humiliating terms, pardoning him and all the other Guelph exiles. He lived quietly in Pisa for some years, although working all the time to extend his influence. War having broken out between Pisa and Genoa in 1284, Count Ugolino was given the command of a division of the Pisan fleet. It was by his flight—usually attributed to treachery—that the fortunes of the day were decided and the Pisans totally defeated at La Meloria (October 1284). But the political ability which he afterwards displayed led to his being appointed podestà for a year and capitano del popolo for ten years. Florence and Lucca took advantage of the Pisan defeat to attack the republic, but Ugolino succeeded in pacifying them by ceding certain castles. He was however less anxious to make peace with Genoa, for the return of the Pisani prisoners, including most of the leading Ghibelines, would have diminished his power. He was now the most influential man in Pisa, and was preparing to establish his absolute sovereignty, when for some reason not clearly understood he was forced to share his power with his nephew Nino Visconti, son of Giovanni. The duumvirate did not last, and the count and Nino soon quarrelled. Then Ugolino tried to consolidate his position by entering into negotiations with the archbishop, Ruggieri degli Ubaldini, the leader of the Ghibelines. But the party having revived once more, the archbishop obliged both Nino and Ugolino to leave the city, and had himself elected podestà and capitano del popolo. However, he allowed Ugolino to return soon afterwards, and was even ready to divide the government of the city with him, although he refused to admit his armed followers. The count, determined to be sole master, attempted to get his followers into the city by way of the Arno, and Ruggieri, realizing the danger, aroused the citizens, accusing Ugolino of treachery for having ceded the castles, and after a day's street fighting (July 1, 1288), Gherardesca was captured and immersed together with his sons Gaddo and Uguccone, and the grandsons Nino di Ugolino, Orsino (or Orso), and Anselmico, in the Muda, a tower belonging to the Gualdini family; here they were detained for nine months, and then starved to death.

The historic details of the episode are still involved in some obscurity, and although mentioned by Villani and other writers, it owes its fame entirely to Dante, who placed Ugolino and Ruggieri in the second ring (Antenora) of the lowest circle of the Inferno (canto xxxiv. 124–140 and xxxv. 1–90). This terrible but magnificent passage, which includes "thirty lines unequalled by any other thirty lines in the whole dominion of poetry" (Landor), has been paraphrased by Chaucer in the "Monk's Tale" and more recently by Shelley. But the reason why Dante placed Ugolino among the traitors is not by any means clear, as the flight from La Meloria was not regarded as treachery by any writer earlier than the 16th century, although G. del Noce, in Il Conte U. della Gherardesca (Città di Castello, 1894), states that that was the only motive; Bartoli, in vol. vi. of his Storia della Letteratura italiana, suggests Ugolino's alliance with the Ghibelines as the motive. The cession of the castles was not treachery.
DELLA PORTA—DELLA ROBBIA

but an act of necessity, owing to the desperate conditions of Pisa.

DELLA PORTA, GIOVANNI BATTISTA (c. 1538–1615). Italian natural philosopher, was born of a noble and ancient family at Naples about the year 1538. He travelled extensively not only in Italy but also in France and Spain, and he was still a youth when he published Magia naturalis, sive de miraculis rerum naturalium lib. IV. (1558), the first draft of his Magia naturalis, in twenty books, published in 1589. He founded in Naples the Academia Secretorum Naturae, otherwise known as the Accademia dei Ozioli; and in 1610 he became a member of the Accademia del Lince at Rome. He died at Naples on the 4th of February 1615.

The following is a list of his principal writings: De miraculis rerum naturalium, in four books (1558); De fertibus literarum notis, in five books (1563, and frequently afterwards, entitled him to high rank among the early writers on cryptography); Phytoponononica (1583, a bulky treatise on the physiology of plants as then understood); Magia naturalis (1589, and often reprinted); De humana phytoponononica, in six books (1593); Villa, in twelve books (1592, an interesting practical treatise on farming, gardening and arbiculture, based upon his own observations at his country-seat near Naples); De refractione, optice partes, in nine books (1593); Pneumatica, in three books (1601); De codicet physoponononica, in six books (1601); Elementa curullina (1601); De distillatione, in nine books (1604); De munitione, in three books (1608); and De aëris transmutationibus, in four books (1609). He also wrote several Italian comedies Olimnato (1591); La Trappolaria (1597); I Due Frettali rivali (1601); La Scintilla (1607); La Chiocciolina (1609); La Carbonaria (1628); La Cintia (1628). Among all the above-mentioned works the chief interest attaches to the Magia naturalis, in which a strange medley of subjects is discussed, including the reproduction of animals, the transmutation of metals, pyrotechny, domestic economy, states, hunting, the preparation of perfumes. In book xvii. he describes a number of optical experiments, including a description of the camera obscura (q.v.).

DELLA QUERCIA, or DELLA FONTE, JACOPO (1374–1438), Italian sculptor, was born at Siena. He was the son of a goldsmith of repute, Pietro d’Agano, to whom he doubtless owed much of his training. There are no records of his early life until the year 1394, when he made an equestrian statue of Gian Todesco. He is next heard of at Florence in 1402, when he was one of six artists who submitted designs for the great gates of the baptistery, in which competition Giovanni was the victor. From Florence he seems to have gone to Lucca, where in 1406 he executed one of his finest works, the monument of Ilaria del Caretto, wife of Paolo Guinigi. It is uncertain if he visited Ferrara in 1408; but at the end of that year he was engaged in negotiations which resulted in his acceptance of the commission for the famous Fonte Gaia, at Siena, early in 1409. This work was not seriously begun by him until 1414, and was only finished in 1419. In 1458 the remains of the fountain were removed to the Opera del Duomo, where they are now preserved; a copy of the original by Sarracchi being erected on the site. After another visit to Lucca in 1422, he returned to Siena, and in March 1425 undertook the contract for the doors of S. Petronio, Bologna. He is known, in following years, to have been to Milan, Verona, Ferrara and Venice; but the rest of his life was chiefly divided between his native city and Bologna. In 1430 he finished the great font of S. Francesco, which he had begun in 1417, contributing himself only one of the bas-reliefs, “Zacharias in the Temple,” the others being by Ghiberti, Donatello and other sculptors. Among the work known to have been done by Jacopo, may be mentioned also the reliefs of the predella of the altar of S. Frediano at Lucca (1422); and the Bentivoglio monu-

2 Vasari is not quite right in his account of these reliefs: he speaks of Euclid and Ptolomy as being in different panels. 

ment which was unfinished at the time of his death on the 20th of October 1438. Jacopo della Quercia’s work exercised a powerful influence on that of the artists of the later Italian Renaissance. He himself reflects not a little of the Gothic spirit, admixing with some of the best qualities of neo-classicism. He was an artist whose powers have hardly yet received the recognition they undoubtedly deserve.

See C. Cornelius, Jacopo della Quercia: eine Kunsthistorische Studie (1896), and works relating generally to the arts in Siena.

(E. F. S.)

DELLA ROBBIA, the name of a family of great distinction in the annals of Florentine art. Its members are enumerated in chronological order below.

I. LUCA Della ROBBIA (1399 or 1400–1482) was son of a Florentine named Simone di Marco della Robbia. According to Vasari, whose account of Luca’s early life is little to be trusted, he was apprenticed to the silversmith Leonardo di Ser Giovanni, who from 1355 to 1371 was working on the grand silver altar front for the cathedral at Pistoia (q.v.); this, however, appears doubtful from the great age which it would give to Leonardo, and is more probable that Luca was pupil of Ghiberti. During the early part of his life Luca executed many important and exceedingly beautiful pieces of sculpture in marble and bronze. In technical skill he was quite the equal of Ghiberti, and, while possessing all Donatello’s vigour, dramatic power and originality, he very frequently excelled him in grace of attitude and soft beauty of expression. No sculptured work of the great 15th century ever surpassed the singing gallery which Luca made for the cathedral at Florence between 1431 and 1440, with its ten magnificent panels of singing angels and dancing boys, far exceeding in beauty those which Donatello in 1433 sculptured for the opposite gallery in the same choir. This splendid work is now to be found in the Museo del Duomo. The general effect of the whole can also be seen at the Victoria and Albert Museum, where a complete cast is fixed to the wall. The same museum possesses a study in gesso duro for one of the panels, which appears to be the original sketch by Luca’s own hand.

In May 1437 Luca received a commission from the signoria of Florence to execute five reliefs for the north side of the campanile, to complete the series begun by Giotto and Andrea Pisano. These panels are so much in the earlier style of Giotto that we must conclude that he had left drawings from which Luca worked. They have representative figures chosen to typify grammar, logic, philosophy, music, and science,—the last represented by Euclid and Ptolomy. In 1438 Luca in association with Donatello received an order for two marble altars for chapels in the cathedral. The reliefs from one of them,—St Peter’s Deliverance from Prison and his Crucifixion—are now in the Bargello. It is probable that these altars were never finished. A tabernacle for the host, made by Luca in 1442, is now at Peretola, near Florence, in the church of S. Maria. A document in the archives of S. Maria Nuova at Florence shows that he received for this 700 florins (1 r. 16 soldi about 1470 of modern money). In 1437 Donatello received a commission to cast a bronze door for one of the sacristies of the cathedral; but, as he delayed to execute this
order, the work was handed over to Luca on the 28th of February 1449, with Michelezzo and Maso di Bartolomeo as his assistants. Part of this wonderful door was cast in 1448, and the last two panels were finished by Luca in 1457, with bronze which was supplied to him by Verrocchio. The door is divided into ten square panels, with small heads in the style of Ghiberti projecting from the framing. The two top subjects are the Madonna and Child and the Baptist, next come the four Evangelists, and below are the four Latin Doctors, each subject with attendant angels. The whole is modelled with perfect grace and dignified simplicity; the heads throughout are full of life, and the treatment of the

drapery in broad simple folds is worthy of a Greek sculptor of the best period of Hellenic art. These exquisite reliefs are perfect models of plastic art, and are quite free from the over-ornamentation and too pictorial style of Ghiberti. Fig. 1 shows one of the panels.

The most important existing work in marble by Luca (executed in 1454-1456) is the tomb of Benvenuto Federighi, bishop of Fiesole, originally placed in the church of S. Pancrazio at Florence, but removed to S. Francesco di Paola on the Bellosguardo road outside the city in 1785. In 1808 it was again removed to the church of S. Trinita in Florence. A very beautiful effigy of the bishop in a restful pose lies on a sarcophagus sculptured with graceful reliefs of angels holding a wreath which contains the inscription. Above are three-quarter length figures of Christ between St John and the Virgin, of conventional type. The whole is surrounded by a rectangular frame formed of painted tiles of exquisite beauty, but out of keeping with the memorial. On each tile is painted, with enamel pigments, a bunch of flowers and fruit in brilliant realistic colours, the loveliness of which is very hard to describe. Though the bunch of flowers on each is painted on one slab, the ground of each tile is formed of separate pieces, fitted together like a kind of mosaic, probably because the pigment of the ground required a different degree of heat in firing from that needed for the enamel painting of the centre. The few other works of this class which exist do not approach the beauty of this early essay in tile painting, on which Luca evidently put forth his utmost skill and patience.

In the latter part of his life Luca was mainly occupied with the production of terra-cotta reliefs covered with enamel, a process which he improved upon, but did not invent, as Vasari asserts. The rationale of this process was to cover the clay relief with an enamel formed of the ordinary ingredients of glass (mascocotto), made white and opaque by oxide of tin. (See CERAMICS: Italian Majolica.) Though Luca was not the inventor of the process,

yet he extended its application to fine sculptured work in terra-cotta, so that it is not unnaturally known now as Della Robbia ware; it must, however, be remembered that by far the majority of these reliefs which in Italy and elsewhere are ascribed to Luca are really the work of some of the younger members of the family or of the atelier which they founded. Comparatively few exist which can with certainty be ascribed to Luca himself. Among the earliest of these are medallions of the four Evangelists in the vault of Brunelleschi's Pazzi chapel in S. Croce. These fine reliefs are coloured with various metallic oxides in different shades of blue, green, purple, yellow and black. It has often been asserted that the very polychromatic reliefs belong to Andrea or his sons, and that Luca's were all in pure white, or in white and blue; this, however, is not the case; colours were used as freely by Luca as by his successors. A relief in the Victoria and Albert Museum furnishes a striking example of this and is of especial value from its great size, and also because its date is known. This is an enormous medallion containing the arms of René of Anjou and other heraldic devices; it is surrounded by a splendidly modelled wreath of fruit and flowers, especially apples, lemons, oranges and fir cones, all of which are brilliantly coloured. This medallion was set up on the façade of the Pazzi Palace to commemorate René's visit to Florence in 1447. Other reliefs by Luca in glazed terra-cotta, are those of the Ascension and Resurrection in the tympani of the doors of the sacristies in the cathedral, executed in 1443 and 1446. Other existing works of Luca in Florence are the sarcophagi in the crypt of the Madonna between two Angels in the Via della Scala, a work of exquisite beauty, and another formerly over the door of S. Pierino del Mercato Vecchio, but now removed to the Bargello (No. 20). The only existing statues by Luca are two lovely enamelled figures of kneeling angels holding candlesticks, now in the canon's sacristy. A very fine work by Luca, executed between 1449 and 1452, is the tympanum relief of the Madonna and four Monastic Saints over the door of S. Domenico at Urbino. Luca also made the four circular medallions of the Virtues set in the wall of the tomb of S. Bernardino of S. Domenico in the church of S. Domenico at Urbino (Florence, 1449-1452), a work of exquisite beauty, and another formerly over the door of S. Pierino del Mercato Vecchio, but now removed to the Bargello (No. 20). The only existing statues by Luca are two lovely enamelled figures of kneeling angels holding candlesticks, now in the canon's sacristy. One of his chief decorative works which no longer exists was a small library or study for Piero de' Medici, wholly lined with enamelled plaques and reliefs. The Victoria and Albert Museum possesses twelve circular plaques of majolica ware painted in blue and white with the Occupations of the Months; these have been attributed to Luca, under the idea that they formed part of the decoration of this room, but their real origin is doubtful.

In 1471 Luca was elected president of the Florentine Guild of Sculptors, but he refused this great honour on account of his age and infirmity. It shows, however, the very high estimation in which he was held by his contemporaries. He died on the 20th of February 1482, leaving his property to his nephews Andrea and Simone. His chief pupil was his nephew Andrea, and Agostino di Duccio, who executed many pieces of sculpture at Rimini, and the graceful but mannered marble reliefs of angels on the façade of S. Bernardino at Perugia, may have been one of his assistants. Vasari calls this Agostino Luca's brother, but he was not related to him at all.

II. ANDREA DELLA ROBBIA (1435-1525), the nephew and pupil of Luca, carried on the production of the enamelled reliefs on a much larger scale than his uncle had ever done; he also extended

the Victoria and Albert Museum possesses what seem to be fine replicas of these statues.

The document in which the order for this and the price paid for it are recorded is published by Yriarte, Gén. d. beaux arts, xxiv. p. 143.

1 One of these medallions, that of the Physicians, is now removed to the inside of the church.

2 It is fully described by Filarete in his Trattato dell' architettura, written in 1464, and therefore was finished before that date; see also Vasari, ed. Milanesi (Florence, 1880), ii. p. 174.

3 His will, dated 19th February 1471, is published by Gaye, Cart. insedi, i. p. 185.

4 In the works of Perkins and others on Italian sculpture these Perugian reliefs are wrongly stated to be of enamelled clay.

Fig. 1.—Bronze Relief of one of the Latin Doctors, from the sacristy door in the cathedral of Florence, by Luca.
its application to various architectural uses, such as friezes and to the making of lavabos (lavatories), fountains and large relays. The result of this was that, though the finest reliefs from the workshop of Andrea were but little if at all inferior to those from the hand of Luca, yet some of them, turned out by pupils and assistants, reached only a lower standard of merit. Only one work in marble by Andrea is known, namely, an altar in S. Maria delle Grazie near Arezzo, mentioned by Vasari (ed. Milanesi, ii. p. 179), and still well preserved.

One variety of method was introduced by Andrea in his enamelled work; sometimes he omitted the enamel on the face and hands (nude parts) of his figures, especially in those cases where he had treated the heads in a realistic manner; as, for example, in the noble tympanum relief of the meeting of St Domenic and St Francis in the loggia of the Florentine hospital of S. Paolo,—a design suggested by a fresco of Fra Angelico’s in the cloister of St Mark’s. One of the most remarkable works by Andrea is the series of medallions with reliefs of Infants in white on a blue ground set on the front of the founding hospital at Florence. These lovely child-figures are modelled with wonderful skill and variety, no two being alike. Andrea produced, for gilds and private persons, a large number of reliefs of the Madonna and Child varied with much invention, and all of extreme beauty of pose and sweetness of expression. These are frequently framed with realistic yet decorative garlands of fruit

![Image](Fig. 2.—Enamelled Clay Relief of Virgin and Child, by Andrea.)

and flowers painted with coloured enamels, while the main relief is left white. Fig. 2 shows a good example of these smaller works. The hospital of S. Paolo, near S. Maria Novella, has also a number of fine medallions with reliefs of saints, two of Christ Healing the Sick, and two fine portraits, under which are white plaques inscribed—"DALL ANNO 1451 ALL ANNO 1405"; the first of these dates is the year when the hospital was rebuilt owing to a papal brief sent to the archbishop of Florence. Arezzo possesses a number of fine enamelled works by Andrea and his sons—a relatable in the cathedral with God holding the Crucified Christ, surrounded by angels, and below, kneeling figures of S. Donato and S. Bernardino; also in the chapel of the Campo Santo is a fine relief of the Madonna and Child with four saints at the sides. In S. Maria in Grado is a very noble relatable with angels holding a crown over a standing figure of the Madonna; a number of small figures of worshipers take refuge in the folds of the Virgin’s mantle, a favourite motive for sculpture dedicated by gilds or other corporate bodies. Perhaps the finest collection of works of this class is at La Verna, not far from Arezzo (see Vasari, ed. Milanesi, ii. p. 179). The best of these, three large relays with representations of the Annunciation, the Crucifixion, and the Madonna giving her Girdle to St Thomas, are probably the work of Andrea himself, the others being by his sons. In 1489 Andrea made a beautiful relief of the Virgin and two Angels, now over the archive-room door in the Florentine Opera del Duomo; for this he was paid twenty gold florins (see Cavallucci, "S. Maria del Fiore"). In the same year he modelled the fine tympanum relief over a door of Prato cathedral, with a half-length figure of the Madonna between St Stephen and St Lawrence, surrounded by a frame of angels’ heads.

In 1491 he was still working at Prato, where many of his best reliefs still exist. A fine bust of S. Lino exists over the side door of the cathedral at Volterra, which is attributed to Andrea. Other late works of known date are a magnificent bust of the Protonotary Almadiano, made in 1510 for the church of S. Giovanni de’ Fiorentini at Viterbo, now preserved in the Palazzo Communale there, and a medallion of the Virgin in Glory, surrounded by angels, made in 1505 for Pistoia cathedral. The latest work attributed to Andrea, though apparently only a workshop production of 1515, is a relief representing the Adoration of the Magi, made for a little church, S. Maria, in Pian di Mugnone, near Florence. Portions of this work are still in the church, but some fragments of it are at Oxford.

III. IV. Five of Andrea’s seven sons worked with their father, and after his death carried on the Robbia fabrique; the dates of their work are shown in the table on p. 383 ante. Early in life two of them came under the influence of Savonarola, and took monastic orders at his Dominican convent; these were MARCO, who adopted the name of Fra Luca, and PAOLO, called Fra Ambrogio. One relief by the latter, a Nativity with four life-sized figures of rather poor work, is in the Cappella degli Spagnuoli in the Siene cathedral of S. Spirito; a MS. in the convent archives records that it was made in 1504.

V. The chief existing work known to be by the second Luca is the very rich and beautiful tile pavement in the uppermost story of Raphael’s loggie at the Vatican, finely designed and painted in harmonious majolica colours. This was made by Luca at Raphael’s request and under his supervision in 1518. It is still in very fine preservation.

VI. GIOVANNI DALLA ROBBIA (1469–1529) during a great part of his life worked as assistant to his father, Andrea, and in many cases the enamelled sculpture of the two cannot be distinguished. Some of Giovanni’s independent works are of great beauty, especially the earlier ones; during the latter part of his life his reliefs deteriorated in style, owing mainly to the universal decadence of the time. A very large number of pieces of Robbia ware which are attributed to Andrea, and even to the elder Luca, were really by the hand of Giovanni. One of his finest works is a large relatable at Volterra in the church of S. Girolamo, dated 1501; it represents the Last Judgment, and is remarkable for the fine modelling of the figures, especially that of the archangel Michael, and a nude kneeling figure of a youth who has just risen from his tomb. Quite equal in beauty to anything of his father’s, from...
whom the design of the figures was probably taken, is the washing
fountain in the sacristy of S. Maria Novella at Florence, made in
1407. It is a large arched recess with a view of the seashore,
not very decorative in style, painted on majolica tiles at the back.
There are also two very beautiful painted majolica panels of fruit-
trees left into the lower part. In the tympanum of the arch is a
very lovely white relief of the Madonna between two Adoring
Angels (see fig. 3). Long coloured garlands of fruit and flowers
are held by nude boys reclining on the top of the arch and others
Visiting the Sick, Visiting Prisoners, Burying the Dead, and
Feeding the Hungry. The seventh, Giving drink to the Thirsty,
was made by Filippo Paladini of Pistoia in 1535; this last is
simply made of painted stucco. The large figures of the virtues
placed between the scenes, and the medallions between the
pillars, are the work of assistants or imitators.

A large octagonal font of enamelled clay, with pilasters at
the angles and panels between them with scenes from the life of
the Baptist, in the church of S. Leonardo at Cerreto Guidi, is a work
of the school of Giovanni; the reliefs are pictorial in style and
coarse in execution. Giovanni's chief pupil was a man named
Benedetto Buglioni (1461-1521), and a pupil of his, one Santi
Buglioni (b. 1549), entered the Robbia workshops in 1521, and
assisted in the later works of Giovanni.

VII. GIROLAMO DELLA ROBBIA (1488-1566), another of
Andrea's sons, was an architect and a sculptor in marble and
bronze as well as in enamelled clay. During the first part of his
life he, like his brothers, worked with his father, but in 1528 he
went to France and spent nearly forty years in the service of the
French Royal family. Francis I employed him to build a palace
in the Bois de Boulogne called the Château de Madrid. This
was a large well-designed building, four storeys high, two of them
having open loggie in the Italian fashion. Girolamo decorated
it richly with terra-cotta medallions, friezes and other architec-
tural features. For this purpose he set up kilns at Suresnes.
Though the palace itself has been destroyed, drawings of it
exist.

The best collections of Robbia ware are in the Florentine
Bargello, Accademia and Museo del Duomo; the Victoria and
Albert Museum (the finest out of Italy); the Louvre, the
Cluny and the Berlin Museums; while fine examples are to be
found in New York, Boston, St Petersburg and Vienna. Many
fine specimens exist in private collections in England, France,
and the United States. The greater part of the Robbia work
still remains in the churches and other buildings of Italy,
especially in Florence, Fiesole, Arezzo, La Verna, Volterra,
Barga, Montepulciano, Lucca, Pistoia, Prato and Siena.

DELMENHORST—

DELMENHORST, a town of Germany, grand duchy of Oldenburg, on the Delme, 8 m. by rail W. from Bremen, at the junction of a line to Vechta. Pop. (1905) 26,147. It has a Protestant and a Roman Catholic church, and is the seat of considerable industries; notably wool-combing, weaving, jute-spinning and the manufacture of linoleum. Delmenhorst was founded in 1230, and from 1247 to 1679, when it was destroyed by the French, was protected by a strong castle.

DELOMÉ, JEAN LOUIS (1740-1806), Swiss jurist and constitutional writer, was born at Geneva in 1740. He studied for the bar, and had begun to practise when he was obliged to emigrate on account of a pamphlet entitled Éxamen de trois parts de droit, which gave offence to the authorities of the town. He took refuge in England, where he lived for several years on the meagre and precarious income derived from occasional contributions to various journals. In 1775 he found himself compelled to accept aid from a charitable society to enable him to return home. He died at Seven, a village in the canton of Schwyz, on the 16th of July 1806.

During his protracted exile in England Delomé made a careful study of the English constitution, the results of which he published in his Constitution de l’Angleterre (Amsterdam, 1775), of which an enlarged and improved edition in English appeared in 1780, and was several times reprinted. The work excited much interest as containing many acute observations on the causes of the excellence of the English constitution as compared with that of other countries. It is, however, wanting in breadth of view, being written before the period when constitutional questions were treated in a scientific manner. Along with a translation of Hume’s History of England it supplied the philosophes with most of their ideas about the English constitution. It was thus used somewhat as a political pamphlet. Several editions were published after the author’s death. Delomé also wrote in English Parallel between the English Government and the former Government of Sweden (1775): A History of the Flagellants (1782), based upon a work of Boileau’s; An Essay on the Union of Scotland with England (1787), and one or two smaller works.

DELONEY (or Deloney), THOMAS, English ballad-writer and pamphleter, produced his earliest indisputable work in 1786, and died about 1800. In 1596 Thomas Nashe, in his Have with you to Saffron Walden, wrote: “Thomas Deloney, the ballating silk-weaver, hath rime enough for all myracles, and wyt to make a Garland of Good Will more than the premises . . . and this deare yeare, together with the silencing of his looms, scarce that, he being constrained to betake himself to carded ale; whence it proceedeth that since Candlemas, or his jiggie, John for the king, not one merrie dittie will come from him, but, the Thunderbolt against Sweareyers,—Repent, England, Repent—and, the strange Judgements of God.” In 1588 the coming of the Armada inspired him for three broadsides, which were reprinted (1860) by J. O. Halliwell-Phillipps. They are entitled “The Queene visiting of the Camp at Tilburie with her entertainment ther,” “A Joyful new Ballad, declaring the happie obtaining of the great Galilean . . . .”, and “A new Ball of the strange and Most cruel Whippes which the Spaniards had prepared.” A collection of Strange Histories (1607) consists of historical ballads by Deloney, with some poems from other hands. This collection, known in later and enlarged editions as The Royal Garland of Love and Delight and The Garland of Delight, contains the ballad of Fair Rosamund. J. H. Dixon in his preface to The Garland of Good Will (Percy Society, 1851) ascribes to Deloney The Blind Beggar of Bednal Green, and The Pleasant and sweet History of Patient Grissel, in prose, with the whole of the Garland of Good Will, including some poems such as “The Spanish Lady’s Love” generally supposed to be by other hands. His other works include The Gentle Craft (1597) in praise of shoemakers, The Pleasant Historie of John Winchcombe (8th ed., 1619), and Thomas of Reading or the Sise Worthie Yeven of the West (earliest extant edition, 1612). Kempe, the actor, jeers at these histories in his Nine Days Wonder, but they were very popular, being reprinted as penny chap-books.

DE LONG, GEORGE WASHINGTON (1844-1881), American explorer, was born in New York city on the 22nd of August 1844. He graduated at the U.S. Naval Academy in 1865, and spent the next fourteen years in naval service in various parts of the world, attaining the rank of lieutenant in 1869, and lieutenant-commander in 1879. In 1873 he took part in the voyage of the “Juníata,” sent to search for and relieve the American Arctic expedition under Hall in the “Polaris,” commanding a steam launch which was sent out from Upernavik, Greenland, to make a thorough search of Melville Bay. On his return to New York the same year he proposed to James Gordon Bennett, of The New York Herald, that the latter should fit out a Polar expedition. It was not until 1879 that the final arrangements were made, the “Pandora,” a yacht which had already made two Arctic voyages under Sir Allan Young, being purchased and rechristened the “Jeanette” for this voyage. The story of this expedition (see POLAR REGIONS) is chiefly remarkable on account of the long and helpless drifting of the “Jeanette” with the polar ice-pack in which she was caught (September 5, 1879) and by which she was finally crushed and sunk on the 4th of June 1881. The members of the expedition set out in three boats, one of which was a balloon, and a survivor, Dr. De Long died from starvation after reaching the mouth of the river. He was the last survivor of his party. His journal, in which he made regular entries up to the day on which he died (October 30, 1881) was edited by his wife and published in 1883 under the title Voyage of the “Jeanette”; and an account of the search which was made for him and his comrades by his heroic companion George W. Melville, who was chief engineer of the expedition and commanded the third of the retreating parties, was published a year later under the title In the Lena Delta. The fate of the “Jeanette” was still more remarkable in its sequel. Three years after she had sunk several articles belonging to her crew were found on an ice-floe near Julianshaab on the southwest coast of Greenland; thus adding fresh evidence to the theory of a continuous ocean current passing across the unknown Polar regions, which was to be finally demonstrated by Nansen’s voyage in the “Fram.” By direction of the United States government, the remains of De Long and his companions were brought home and interred with honour in his native city.

DELOME, MARION (c. 1613-1674), was the daughter of Jean de Lou, sieur de l’Orme, president of the treasurers of France in Champagne, and of Marie Chastelain. She was born at her father’s château near Champauguet. Initiated into the philosophy of pleasure by the epicurean and atheist Jacques Vallée, sieur Desbarreux, she soon left him for Cinq Mars, at that time at the height of his popularity, and succeeded, it is said, in marrying him in secret. From this time Marion Delome’s salon became one of the most brilliant centres of elegant Parisian society. After the execution of Cinq Mars she is said to have numbered among her lovers Charles de St. Evremond (1670-1703) the wit and littérateur, Buckingham (Villiers), the great Condé, and even Cardinal Richelieu. Under the Fronte her salon became a meeting place for the disaffected, and Mazarin is said to have sent to arrest her when she suddenly died. Her last years have been adorned with considerable legend (cf. Merecourt, Confessions de Marie Delome, Paris, 1836). It seems established that she died in 1650. But she was believed to have lived until 1706, having had the most fantastic adventures, including marriage with an English lord, and an old age spent in poverty in Paris. Her name has been popularized by various authors, especially by Alfred de Vigny in his novel Cinq Mars, by Victor Hugo in the drama Marion Delome, and by G. Bottesini in an opéra of the same title.

See P. J. Jacob, Marion Delome et Ninon Lenclos (Paris, 1859); J. Peladan, Histoire et légende de Marion de Lorne (Paris, 1882).

DEL’ORME, PHILIBERT (c. 1510-1570), French architect, one of the great masters of the Renaissance, was born at Lyons, the son of Jehan de L’Orme, who practised the same art and brought his son up to it. At an early age Philibert was sent to Italy to study (1533-1536) and was employed there by Pope Paul III. Returning to France he was patronized by Cardinal de Bellay.
at Lyons, and was sent by him about 1540 to Paris, where he began the Château de St Maur, and enjoyed royal favour; in 1545 he was made architect, to Francis I. and given the charge of works in Brittany. In 1548 Henry II. gave him the supervision of Fontainebleau, Saint-Germain and the other royal buildings; but on his death (1559) Philibert fell into disgrace. Under Charles IX., however, he returned to favour, and was employed to construct the Tuileries, in collaboration with Jean Brantil. He died in Paris on the 8th of January 1570. Much of his work has disappeared, but his fame remains. An ardent humanist and student of the antique, he yet vindicated resolutely the French tradition in opposition to Italian tendencies; he was a man of independent mind and a vigorous originality. His masterpiece was the Château d'Anet (1552-1559), built for Diane de Poitiers, the plans of which are preserved in Du Cerceau's *Plus excellens bastiments de France*, though part of the building alone remains; and his designs for the Tuileries (also given by Du Cerceau), begun by Catherine de' Medici in 1565, were magnificent. His work is also seen at Chenonceaux and other famous châteaux; and his tomb of Francis I. at St Denis remains a perfect specimen of his art. He wrote two books on architecture (1561 and 1567).

**DELOS** (mod. Mikra Dili, or Little Delos, to distinguish it from Megali Dili, or Great Delos), an island in the Aegean, the smallest but most famous of the Cyclades, and, according to the ancient belief, the birthplace of Apollo, on which the group arranged itself in a nearly circular form. It is a rugged mass of granite, about 3 m. long and 1 m. to ½ m. broad, about ½ m. E. of Megali Dili or Rheneia, and 2 m. W. of Myconus. Towards the centre it rises to its greatest height of 350 ft. in the steep and rocky peak of Mount Cynthus, which, though overtopped by several eminences in the neighbouring islands, is very conspicuous from the surrounding sea. It is now completely destitute of trees, but it abounds with brushwood of lentisk and cistus, and here and there affords a patch of corn-land to the occasional sower from Myconus.

I. Archaeology.—Excavations have been made by the French School at Athens upon the island of Delos since 1879, chiefly by Th. Homolle. They have proceeded slowly but systematically, and the method adopted, though scientific and economical, left the site in some apparent confusion, but the debris have more recently been cleared away to a considerable extent. The complete plan of the sacred precinct of Apollo has been recovered, as well as those of a considerable portion of the commercial quarter of Hellenistic and Roman times, of the theatre, of the temples of the foreign gods, of the temples on the top of Mount Cynthus, and of several very interesting private houses. Numerous works of sculpture of all periods have been found, and also a very extensive series of inscriptions, some of them throwing much light upon the subject of temple administration in Greece.

The most convenient place for landing is protected by an ancient mole; it faces the channel between Delos and Rheneia, and is about opposite the most northerly of the two little islands now called 'Peyastris'. From this side the sacred precinct of Apollo is approached by an avenue flanked by porticoes, that upon the seaside bearing the name of Philip V. of Macedon, who dedicated it about 200 B.C. This avenue must have formed the usual approach for sacred embassies and processions; but it is probable that the space to the south was not convenient for marshalling them, since Nicias, on the occasion of his famous embassy, built a bridge from the island of Hecate (the Greater Rhemiatari) to Delos, in order that the imposing Athenian procession might not miss its full effect. Facing the avenue were the propylaea that formed the chief entrance of the precinct of Apollo. They consisted of a gate faced on the outside with a projecting portico of four columns, on the inside with two columns in antis. Through this one entered a large open space, filled with votive offerings and containing a large exedra. The sacred road continued its course to the north-east corner of this open space, with the precinct of Artemis on its west side, and, on its east side, a terrace on which stood three temples. The southernmost of these was the temple of Apollo, but only its back was visible from this side. Though there is no evidence to show to whom the other two were dedicated, the fact that they faced west seems to imply that they were either dedicated to heroes or minor deities, or that they were treasuries. Beyond them a road branches to the right, sweeping round in a broad curve to the space in front of the temple of Apollo. The outer side of this curve is bounded by a row of treasuries, similar to those found at Delphi and Olympia, and serving to house the more costly offerings of various islands or cities. The space to the east and south of the temple of Apollo could also be approached directly from the propylaea of entrance, by turning to the right through a passage-like building with a porch at either end. Just to the north of this may be seen the basis of the colossal statue of Apollo dedicated by the Naxians, with its well-known archaic inscription; two large fragments of the statue itself may still be seen a little farther to the north.

The temple of Apollo forms the centre of the whole precinct,
DELOS

which it dominates by the height of its steps as well as of the
terrace already mentioned; its position must have been more
commanding in ancient times than it is now that heaps of earth
and debris overlie so much of the level. The temple was of Doric
style, with six columns at the front and back and nineteen at the
sides; it was built early in the 4th century B.C.; little if any
traces have been found of the earlier building which it super-
seded. Its sculptural decoration appears to have been but
scanty; the metopes were plain. The groups which ornamented,
as acroteria, the two gables of the temple have been in part
recovered, and may now be seen in the national museum at
Athens; at the one end was Boreas carrying off Oreithya, at the
other Eos and Cephalus, the centre in each case being occupied
by the winged figure that stood out against the sky—a variation
on the winged Victories that often occupy the same position on
temples.

To the east of the space in front of the temple was an oblong
building of two chambers, with a colonnade on each side but not
in front; this may have been the Prytaneum or some other
official building; beyond it is the most interesting and character-
istic of all the monuments of Delphi. This is a long narrow hall,
running from north to south, and enclosed by a portico at its
south end. It was the famous altar, built out of the horns of the victims, which was sometimes reckoned among
the seven wonders of the world. The rest of the room is taken
up by a paved space, surrounded by a narrow gangway; and on
this it is supposed that the γαρνσα or stork-dance took place.
The most remarkable architectural feature of the building is the
partition that separated the altar from this long gallery; it
consists of two columns between antae, with capitals of a very
peculiar form, consisting of the fore parts of bulls set back to
back; from these the whole building is sometimes called the
sanctuary of the bulls. Beyond it, on the east, was a sacred
wood filling the space up to the wall of the precinct; and at the
south end of this was a small open space with the altar of Zeus
Policus.

At the north of the precinct was a broad road, flanked with
votive offerings and exedrae, and along the boundary were
porticoes and chambers intended for the reception of the θυεριναι
or sacred embassies; there are two entrances on this side, each
of them through extensive propylaea.

At the north-west corner of the precinct is a building of lime-
stone, the θυερινες θεας often mentioned in the inventories of
the treasuries of the Delian shrine. South of it is the precinct of
Artemis, containing within it the old temple of the goddess;
her more recent temple was to the south of her precinct, opening
not into it but into the open space entered through the southern
propylaea of the precinct of Apollo. The older temple is
mentioned in some of the inventories as "the temple in which
were the seven statues"; and close beside it was found a series of
archaic draped female statues, which was the most important
of its kind until the discovery of the finer and better preserved set
from the Athenian Acropolis.

Within the precinct there were found many statues and other
works of art, and a very large number of inscriptions, some of
them giving inventories of the votive offerings and accounts of
the administration of the temple and its property. The latter are
of considerable interest, and give full information as to the
sources of the revenue and its financial administration.

Outside the precinct of Apollo, on the south, was an open
place; between this and the precinct was a house for the priests,
and within it, in a kind of court, a set of small structures that may
have served as the tombs of the Hyperboreans mentioned.
Just to the east was the temple of Dionysus, which is of peculiar
plan, and faces the open place; on the other side of it is a large
rectangular court, surrounded by colonnades and chambers which
served as offices, the whole forming a sort of commercial
exchange; in the middle of it was a temple dedicated to
Aphrodite and Hermes.

To the north of the precinct of Apollo, between it and the
sacred lake, there are very extensive ruins of the commercial
town of Delos; these have been only partially cleared, but have
yielded a good many inscriptions and other antiquities. The
most extensive building is a very large court surrounded by
chambers, a sort of club or exchange. Beyond this, on the way
to the east coast, are the remains of the new and the old palaestra,
also partially excavated.

The shore of the channel facing Rheneia is lined with docks and
warehouses, and behind them, as well as elsewhere in the island,
there have been found several private houses of the 2nd or 3rd
century B.C. Each of these consists of a single court surrounded
by columns and often paved with mosaic; various chambers
open out of the court, including usually one of large proportions,
the ἀνάθεια or dining-room for guests.

The theatre, which is set in the lower slope of Mount Cynthus,
has the wings of the auditorium supported by massive sub-
structures. The most interesting feature is the scena, which
is unique in plan; it consisted of an oblong building of two storeys,
surrounded on all sides by a low portico or terrace reaching to
the level of the first floor. This was supported by pillars, set closer
along the front than at the sides and back. An inscrip-
tion found in the theatre showed that this portico, or at least the
front portion of it, was called the prosenium or logeum, two
terms of which the identity was previously disputed.

The temple of Athena, built in the 6th century B.C., has a
precinct dedicated to Zeus Cynthius and Athena Cynthis. Some
way down the slope of the hill, between the cave-temple and the ravine of the Inopus, is a terrace with the temples of the foreign gods, Isis and Serapis, and a small
odoum.

II. History.—Many alternative names for Delos are given by
tradition; one of these, Ortygia, is elsewhere also assigned to an
island sacred to Artemis. Of the various traditions that were
current among the ancient Greeks respecting the origin of Delos,
the most popular describes it as drifting through the Aegean till
moored by Zeus as a refuge for the wandering Leto. It supplied
a birthplace to Apollo and Artemis, who were born beneath a
palm tree beside its sacred lake, and became for ever sacred to
these twin deities. The island first appears in history as the sea-
t of a great Ionic festival to which the various Ionic states, includ-
ing Athens, were accustomed annually to despatch a sacred
embassy, or Thoria, at the anniversary of the birth of the god
on the 7th of Thargelion (about May). In the 5th century B.C.
the influence of the Delian Apollo was at its height; the inhabitants
of Samos dedicated the neighbouring island of Rheneia to his
service and Pelisstratus of Athens caused all the area within sight
of the temple to be cleared of the tombs by which its sanctity was
impaired. After the Persian wars, the predominance of Athens
led to the transformation of the Delian amphictyony into the
Athenian empire. (See Delian League.) In 426 B.C., in con-
nexion with a reorganization of the festival, which henceforth
was celebrated in the third year of every Olympiad, the Athenians
instituted a more elaborate Lustration, caused every tomb to be
removed from the island, and established a law that ever after
any one who was about to die or to give birth to a child should
be at once conveyed from its shores. And even this was not
accounted sufficient, for in 422 they expelled all its secular
inhabitants, who were, however, permitted to return in the
following year. At the close of the Peloponnesian War the
Spartans gave to the people of Delos the management of their
own affairs; but the Athenian predominance was soon after
restored, and survived an appeal to the amphictyony of Delphi
in 345 B.C. During Macedonian times, from 322 to 166 B.C., Delos
again became independent; during this period the shrine was
enriched by offerings from all quarters, and the temple and
its possessions were administered by officials called ἀργοτριαὶ.
After 166 B.C. the Romans restored the control of Delian wor-
ship to Athens, but granted to the island various commercial
privileges which brought it great prosperity. In 87 B.C. Meno-
phanes, the general of Mithradates VI. of Pontus, sacked the
island, which had remained faithful to Rome. From this blow it
never recovered; the Athenian control was resumed in 42 B.C.,
but Pausanias (viii. 33. 2) mentions Delos as deserted but for a
few Athenian officials; and several epigrams of the 1st or 2nd century A.D. attest the same fact, though the temple and worship were probably kept up until the official extinction of the ancient religion. A museum has now been built to contain the antiquities found in the excavations; otherwise Delos is now uninhabited, though during the summer months a few shepherds cross over with their flocks from Myconus or Rheneia. As a religious centre it is replaced by Tenos and as a commercial centre by the flourishing port of Syra.

See Lefèbvre, Recherches sur Délos (Paris, 1876). Numerous articles in the Bulletin de correspondance hellénique record the various discoveries at Delos as they were made. See also Th. Homolle, Les Archives de l'Antiquité sacrée à Délos (Paris, 1877). The best consecutive account is given in the Guide Joanne, Grèce, ii. 443-464. For history, see Sir R. C. Jebb, Journal of Hellenic Studies, i. (1889), pp. 7-62. For works of art found at Delos see Greek Art (E. Gr.)

DE LOUTHERBOURG, PHILIP JAMES (1740-1812), English artist, was born at Strassburg on the 31st of October 1740. Abandoning his father, the representative of a Polish family, practised miniature painting; but he spent the greater part of his life in London, where he was naturalized, and exerted a considerable influence on the scenery of the English stage, as well as on the artists of the following generation. De Louthourbourg was intended for the Lutheran ministry, and was educated at the university of Strassburg. As the calling, however, was foreign to his nature, he insisted on being a painter, and placed himself under Vanloo in Paris. The result was an immediate and precocious development of his powers, and he became a figure in the fashionable society of that day. In 1767 he was elected into the French Academy below the age required by the law of the institution, and painted landscapes, sea storms, battles, all of which had a celebrity above those of the specialists then working in Paris. His début was made by the exhibition of twelve pictures, including "Storm at Sunset," "Night," "Morning after Rain." He is next found travelling in Switzerland, Germany and Italy, and from this period until 1777 he is chiefly occupied in the production of his more important works. In 1777 he returned to England. He now devoted himself as much by mechanical inventions as by painting. One of these, showing quite new effects produced in a model theatre, was the wonder of the day. The exhibition of lights behind canvas representing the moon and stars, the illusory appearance of running water produced by clear blue sheets of metal and gauze, with loose threads of silver, and so on, were his devices. In 1771 he came to London, and was employed by Garrick, who offered him £500 a year to apply his inventions to Drury Lane, and to superintend the scene-painting, which he did with complete success, making a new era in the adjuncts of the stage. Garrick's own piece, the Christmas Tale, and the pantomime, 1781-1782, introduced the novelties to the public, and the delight not only of the masses, but of Reynolds and the artists, was unbounded. The green trees gradually became russet, the moon rose and lit the edges of passing clouds, and all the world was captivated by effects we now take little notice of. A still greater triumph awaited him on his opening an entertainment called the "Eldiphusion," which showed the rise, progress and result of a storm at sea—that which destroyed the great Indianam, the "Halsewell," and the Fallen Angels raising the Palace of Pandemonium. De Louthourbourg has been called the inventor of the pantomima, but this honour does not belong to him, although it first appeared about the same time as the ediphusion. The first pantomima was painted and exhibited by Robert Barker.

All this mechanism did not prevent De Louthourbourg from painting. "Lord Howe's Victory off Ushant" (1794), and other large naval pictures were commissioned for Greenwich Hospital Gallery, where they still remain. His finest work was the " Destruction of the Armada." He painted also the Great Fire of London, and several historical works, one of these being the "Attack of the Combined Armies on Valenciennes" (1793). He was made R.A., in addition to other distinctions, in 1781, shortly after which date we find an entirely new mental impulse taking possession of him. He joined Balsamo, comte de Cagliostro, and travelled about with this extraordinary person—leaving him, however, before his condemnation to death. We do not hear that Mesmer had attracted De Louthourbourg, nor do we find an exact record of his connexion with Cagliostro. A pamphlet published in 1789, A List of a Few Cures performed by Mr. and Mrs. De Louthourbourg without Medicine, shows that he had taken up faith-healing, and there is a story that a successful projection of the philosopher's stone was only spoiled by the breaking of the crucible by a relative. He died on the 11th of March 1812. His publications are few—some sets of etchings, and English Scenery (1805).

DELPHI (the Pytho of Homer and Herodotus; in Boeotian inscriptions Βεδός, on coins Δαλφός), a place in ancient Greece in the territory of Phoïs, famous as the seat of the most important temple and oracle of Apollo. It was situated about 6 m. inland from the shores of the Corinthian Gulf, in a rugged and romantic glen, closed on the N. by the steep wall-like under-cliffs of Mount Parnassus known as the Phaedriades or Shining Rocks, on the E. and W. by two minor ridges or spurs, and on the S. by the irregular heights of Mount Cirphis. Between the two mountains the Pleistus flowed from east to west, and opposite the town received the brooklet of the Castalian fountain, which rose in a deep spring in the centre of the Parnassian cliff. About 7 m. to the north, on the side of Mount Parnassus, was the famous Corycian cave, a large grotto in the limestone rock, which afforded the people of Delphi a refuge during the Persian invasion. It is now called in the district the Sarant' Aulai or Forty Courts, and is said to be capable of holding 3000 people.

I. The Site.—The site of Delphi was occupied by the modern village of Castri until it was bought by the French government in 1891, and the peasant proprietors expropriated and transferred to the new village of Castri, a little farther to the west. Excavations had been made previously in some parts of the precinct; for example, the portico of the Athenians was laid bare in 1860. The systematic clearing of the site began in the spring of 1892, and it was rapidly cleared of earth by means of a light railway. The plan of the precinct is now easily traced, and with the help of Pausanias many of the buildings have been identified.

The ancient wall running east and west, commonly known as the Hellenico, has been found extant in its whole length, and the two boundary walls which ran up the hill at each end of it, traced. In the eastern of these was the main entrance by which Pausanias went in along the Sacred Way. This paved road is easily recognized as it zigzags up the hill, with terraces and the bases of various offerings facing it on both sides. It mounts first westwards to an open space, then turns eastwards till it reaches the eastern end of the terrace wall that supports the temple, and then turns again and curves up north and then west towards the temple. Above this, approached by a stair, are the Lesche and the theatre, occupying respectively the north-east and north-west corner of the precinct. On a higher level still, a little to the west, is the stadium. There are several narrow paths and stairs that cut off the zigzags of the Sacred Way.

In describing the monuments discovered by the French excavators, the simplest plan is to follow the route of Pausanias. Outside the entrance is a large paved court of Roman date, flanked by a colonnade. On the north side of the Sacred Way, close to the main entrance, stood the famous offering dedicated by the Laconians after the battle of Aegospotami. It was a large quadrangular building of conglomerate, with a back wall faced with stucco, and stood open to the road. On a stepped pedestal facing the open stood the statues of the gods and the admirals, perhaps in rows above one another.

The statues of the Epigoni stood on a semicircular basis on the south side of the way. Opposite them stood another semicircular basis which carried the statues of the Argive kings, whose names are cut on the pedestal in archaic characters, reading from right to left. Farther west was the Sicilian treasury on the south of the way. It was in the form of a small Doric temple in antis, and had its entrance on the east. The present foundations are built of architectural fragments, probably from an earlier building of circular form on the same site. The sculptures from this treasury are in the museum, as are the other sculptures found on the site. These sculptures, which are in
DELPHI

rough limestone, most likely belong to the earlier building, as their surface is in a better state of preservation than could be possible if they had been long exposed to the air. The earlier treasury was probably destroyed either by earthquake or by the percolation of water through the terracing.

The Cnidian treasury stands on the south side of the way farther west. This building was originally surmised by the excavators to be the treasury of Siphnos, but further evidence led them to change their opinion. The treasury was raised on a quadrangular structure, supported on its south side by the Hellenico, and built of tufa. The lower courses are left rough and were most likely hidden. A small Ionic temple of marble with two caryatids between antae stood on this substructure. The sculpture from this treasury, which ornamented its frieze and pediment, is of great interest in the history of the development of the art, and the fragments of architectural mouldings are of great delicacy and beauty. The whole work is perhaps the most perfect example we possess of the transitional style of the early 5th century. Standing back somewhat from the path just as it bends round up the hill is the Theban treasury. Farther north, west of the path, is the Athenian treasury. This structure, which was in the form of a small Doric temple in antis, appears to have suffered from the building above it having been shaken down by an earthquake. It has now been rebuilt with the original blocks. There can be no doubt about the identity of the building, for the basis on which it stands bears the remains of the dedicatory inscription, stating that it was erected from the spoils of Marathon. Almost all the sculptured metopes are in the museum, and are of the highest interest to the student of archaic art. The famous inscriptions with hymns to Apollo accompanied by musical notation were found on stones belonging to this treasury.

Above the Athenian treasury is an open space, in which is a rock which has been identified as the Sybil's rock. It has steps hewn in it, and has a cleft. The ground round it has been left rough like the space on the Acropolis at Athens identified as the ancient altar of Athena. Here too was placed the curious column, with many flutes and an Ionic capital, on which stood the colossal sphinx, dedicated by the Naxians, that has been pieced together and placed in the museum.

A little farther on, but below the Sacred Way, is another open space, of circular form, which is perhaps the Δωρ or sacred threshing-floor on which the drama of the slaying of the Python by Apollo was periodically performed. Opposite this space, and backed against beautifully jointed polygonal wall which has for some time been known, and which supports the terrace on which the temple stands, is the colonnade of the Athenians. A dedicatory inscription runs along the face of the top step, and has been the subject of much dispute. Both the forms of the letters and the style of the architecture show that the colonnade cannot date, as Pausanias says, from the time of the Peloponnesian War; Th. Homolé now assigns it to the end of the 6th century. The polygonal terrace wall at the back, on being cleared, proves to be covered with inscriptions, most of them concerning the manumission of slaves.

After rounding the east end of the terrace wall, the Sacred Way turns northward, leaving the Great Altar, dedicated by the Chians, on the left. After passing the altar, it turns to the left again at right angles, and so enters the space in front of the temple. Remains of offerings found in this region include those dedicated by the Cyrenians and by the Corinthians. The site of the temple itself carries the remains of successive structures. Of that built by the Alcmaeonids in the 6th century B.C. considerable remains have been found, some in the foundations of the later temple and some lying where they were thrown by the earthquake. The sculptures found have been assigned to this building, probably to the gables, as they are archaic in character, and show a remarkable resemblance to the sculptures from the pediment of the early temple of Athena at Athens. The existing foundations are these of the temple built in the 4th century. They give no certain information as to the sacred cleft and other matters relating to the oracle. Though there are great hollow spaces in the structure of the foundations, these appear merely to have been intended to save material, and not to have been put to any religious or other use. Up in the north-eastern corner of the precinct, standing at the foot of the cliffs, are the remains of the interesting Cnidian Lesche or Clubhouse. It was a long narrow building accessible only from the south, and the famous paintings were probably disposed around the walls so as to meet in the middle of the north side. Some scanty fragments of the lower part of the frescoed walls have survived; but they are not enough to give any information as to the work of Polygnotus.

At the north-western corner of the precinct is the theatre, one
of the best preserved in Greece. The foundations of the stage are extant, as well as the orchestra, and the walls and seats of the auditorium. There are thirty-three tiers of seats in seven sets, and a paved diazoma. The sculptures from the stage front, now in the museum, have the labours of Heracles as their subject. The date of the theatre is probably early 2nd century B.C.

The stadium lies, as Pausanias says, in the highest part of the city to the north-west. It stands on a narrow plateau of ground supported on the south-east by a terrace wall. The seats have been cleared, and are in a state of extraordinary preservation. A few of those at the east end are hewn in the rock. No trace of the marble seats mentioned by Pausanias has been found, but they have probably been carried off for lime or building, as they could easily be removed. An immense number of inscriptions have been found in the excavations, and many works of art, including a bronze charioteer, which is one of the most admirable statues preserved from ancient times.

II. History.—Our information as to the oracle at Delphi and the manner in which it was consulted is somewhat confused; there probably was considerable variation at different periods. The tale of a hole from which intoxicating "mephitic" vapour arose has no early authority, nor is it scientifically probable (see A. P. Oppé in Journal of Hellenic Studies, xxiv. 214). The questions had to be given in writing, and the responses were uttered by the Pythian priestess, in early times a maiden, later a woman over fifty attired as a maid. After chewing the sacred bay and drinking of the spring Cassotis, which was conducted into the temple by artificial channels, she took her seat on the sacred tripod in the inner shrine. Her utterances were reduced to verse and edited by the prophets and the "holy men" (θηρίοι).

For the influence and history of the oracle see Oracle. Delphi also contained the "Omphalos," a sacred stone bound with fillets, supposed to mark the centre of the earth. It was said Zeus had started two eagles from the opposite extremities and they met there. Other tales said the stone was the one given by Poseidon to the Argives for Zeus to have.

For the history of the Delphic Amphictiony see under AMPHICYONY. The oracle at Delphi was asserted by tradition to have existed before the introduction of the Apolline worship and to have belonged to the goddess Earth (Ge or Gaia). The Homeric Hymn to Apollo evidently combines two different versions, one of the approach of Apollo from the north by land, and the other of the introduction of his votaries from Crete. The earliest stone temple was said to have been built by Trophonius and Agamedes. This was destroyed by fire in 548 B.C., and the contract for rebuilding was undertaken by the exiled Alcmaeonidae from Athens, who generously substituted marble on the eastern front for the poros specified (see Cleisthenes, ad init.). Portions of the pediments of this temple have been found in the excavations; but no sign has been found of the pediments mentioned by Pausanias, representing on the east Apollo and the Muses, and on the west Dionysus and the Thyiades (Bacchantes), and designed by Praxiteles, the pupil of Calanias. The temple which was seen by Pausanias, and of which the foundations were found by the excavators, was the one of which the building is recorded in inscriptions of the 4th century. A raid on Delphi attempted by the Persians in 480 B.C. was said to have been frustrated by the god himself, by means of a storm or earthquake which hurled rocks down on the invaders; a similar tale is told of the raid of the Gauls in 270 B.C. But the sacrilege thus escaped at the hands of foreign invaders was inflicted by the Phocian defenders of Delphi during the Sacred War, 356-346 B.C., when many of the precious votive offerings were melted down. The Phocians were condemned to replace their value to the amount of 10,000 talents, which they paid in instalments. In 86 B.C. the sanctuary and its treasures were put under contribution by L. Cornelius Sulla for the payment of his soldiers; Nero removed no fewer than 500 bronze statues from the temple and its precincts; Constantine the Great enriched his new city by the sacred tripod and its support of internitwined snakes dedicated by the Greek cities after the battle of Plataea. This still exists, with its inscription, in the Hippodrome at Constantinople. Julian afterwards sent Orbiasus to restore the temple; but the oracle responded to the emperor's enthusiasm with nothing but a wall over the glory that had departed.

Provisional accounts of the excavations have appeared during the excavations in the Bulletin de correspondance hellénique. A summary is given in J. G. Frazer, Pausanias, vol. v. The official account is entitled Fouilles de Delphes. For history see Hiller von Gatringen in Pauly-Wissowa, Realencyclopddie, s. v. "Delphi." For cult see Le Strange, Cults of the States, iv. 179-218. For the works of art discovered see GREEK ART.

DELFHINIA, a festival of Apollo Delphinus held annually on the 6th (or 7th) of the month Munychion (April) at Athens. All that is known of the ceremonies is that a number of girls proceeded to his temple (Delphinium) carrying suppliants' branches and seeking to propitiate Apollo, probably as a god having influence on the sea. It was at this time of year that navigation began again after the storms of winter. According to the story in Plutarch (Theseus, 18), Theseus, before setting out to Crete to slay the Minotaur, repaired to the Delphinium and deposited, on his own behalf and that of his companions on whom the lot had fallen, an offering to Apollo, consisting of a branch of consecrated olive, bound with white wool; after which he prayed to the god and set sail. The sending of the maidens to propitiate the god during the Delphinia commemorates this event in the life of Theseus.

See A. Mommsen, Festedt Statt Athen (1808); L. Preller, Griechische Mythologie (4th ed., 1887); P. Stengel, Die griechische Kultusaltertümer (1889); Darenberg and Saglio, Dictionnaire des antiquités; G. F. Schörmann, Griechische Altertümer (4th ed., 1897-1902).

DELFHINUS ("THE DELPHIN"), in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.) and catalogued by Ptolemy (10 stars), Tycho Brahe (10 stars), and Hevelius (14 stars). Delphi is a double star: a yellowish of magnitude 4, and a bluish of magnitude 8.

DELTA (from the shape of the Gr. letter Δ, delta, originally used of the mouth of the Nile), a tract of land enclosed by the diverging branches of a river's mouth and the seacoast, and traversed by other branches of the stream. This triangular tract is formed from the fine silt brought down in suspension by a muddy river and deposited when the river reaches the sea. When tidal currents are feeble, the delta frequently advances some distance seawards, forming a local prolongation of the coast.

DELUC, JEAN ANDRÉ (1727-1817), Swiss geologist and meteorologist, born at Geneva on the 8th of February 1727, was descended from a family which had emigrated from Lucca and settled at Geneva in the 15th century. His father, François Deluc, was the author of some publications in refutation of Mandeville and other rationalistic writers, which are best known through Rousseau's humorous account of his ennu in reading them; and he gave his son an excellent education, chiefly in mathematics and natural science. On completing it he engaged in commerce, which principally occupied the first forty-six years of his life, without any other interruption than that which was occasioned by some journeys of business into the neighbouring countries, and a few scientific excursions among the Alps. During these, however, he collected by degrees, in conjunction with his brother Guillaume Antoine, a splendid museum of mineralogy and of natural history in general, which was afterwards increased by his nephew J. André Deluc (1763-1847), who was also a writer on geology. He at the same time took a prominent part in politics. In 1768 he was sent to Paris on an embassy to the due de Choiseul, whose friendship he succeeded in gaining. In 1770 he was nominated one of the Council of Two Hundred. Three years later unexpected reverses in business made it advisable for him to quit his native town, which he only revisited once for a few days. The change was welcome in so far as it set him entirely free for scientific pursuits, and it was with little regret that he removed to England in 1773. He was made a fellow of the Royal Society in the same year, and received the appointment of reader to Queen Charlotte, which he continued
to hold for forty-four years, and which afforded him both leisure and a competent income. In the latter part of his life he obtained leave to make several tours in Switzerland, France, Holland and Germany. In Germany he passed the six years from 1798 to 1804; and after his return he undertook a geological tour through England. When he was at Geneva, in the beginning of his German tour, he received the compliment of being appointed honorary professor of philosophy and geology in that university; but he never entered upon the active duties of a professorship. He was also a correspondent of the Academy of Sciences at Paris, and a member of several other scientific associations. He died at Windsor on the 7th of November 1817.

His favourite studies were geology and meteorology. The situation of his native country had naturally led him to contemplate the peculiarities of the earth's structure, and the properties of the atmosphere, as particularly displayed in mountainous countries, and as subservient to the measurement of heights. According to Cuvier, he ranked among the first geologists of his age. His principal geological work, *Lettres physiques et morales sur les montagnes et sur l'histoire de la terre et de l'homme*, first published in 1778, and in a more complete form in 1790, was dedicated to Queen Charlotte. It dealt with the appearance of mountains and the antiquity of the human race, explained the six days of the Mosaic creation as so many epochs preceding the actual state of the globe, and attributed the deluge to the filling up of cavities supposed to have been left void in the interior of the earth. He published later an important series of volumes on geological travels in the north of Europe (1810), in England (1811), and in France, Switzerland and Germany (1813). These were translated into English.

Deluc's original experiments relating to meteorology were valuable to the natural philosopher; and he discovered many facts of considerable importance relating to heat and moisture. He noticed the disappearance of heat in the thawing of ice about the same time that J. Black founded on it his ingenious hypothesis of latent heat. He ascertained that water was more dense about 40° F. (4° C.) than at the temperature of freezing, expanding equal to on each side of the maximum; and he was the originator of the theory, afterward readvanced by John Dalton, that the quantity of aqueous vapour contained in any space is independent of the presence or density of the air, or of any other elastic fluid.

His *Recherches sur les modifications de l'atmosphère* (2 vols. 4to, Geneva, 1772; 2nd ed., 4 vols. 8vo, Paris, 1784) contains many accurate and ingenious experiments upon moisture, evaporation and the indications of hygrometers and thermometers, applied to the barometer employed in determining heights. In the *Phil. Trans.*, 1773, appeared his account of a new hygrometer, which resembled a mercurial thermometer, with an ivory bulb, which expanded by moisture, and caused the mercury to descend. The first correct rules ever published for measuring heights by the barometer were those he gave in the *Phil. Trans.*, 1771, p. 138. His *Lettres sur l'histoire physique de la terre* (8vo, Paris, 1798), addressed to Professor Blumenbach, contains an essay on the existence of a General Principle of Mutual Adaptation in the earth; that history also gives an interesting account of some conversations of the author with Voltaire and Rousseau. Deluc was an ardent admirer of Bacon, on whose writings he published two works—Bacon tel qu'il est (8vo, Berlin, 1800), showing the bad faith of the French translator, who had omitted many passages favourable to revealed religion, and *Précis de la philosophie de Bacon* (2 vols. 8vo, Paris, 1802), giving an interesting view of the progress of natural science. *Lettres sur le Christianisme* (Berlin and Hanover, 1801, 1803) was a controversial correspondence with Dr Teller of Berlin in regard to the Mosaic cosmogony. *Son Traité élémentaire de géologie* (8vo, Paris, 1809, also in English, by de la Fite, the same year) was principally intended as a refutation of the Vulcanian system of Hutton and Playfair, who deduced the changes of the earth's structure from the operation of fire, and attributed a higher antiquity to the present state of the continents than is required in the Neptunian system adopted by Deluc after D. Dohoume. He sent to the Royal Society, in 1809, a long paper on separating the chemical from the electrical effect of the pile, with a description of the electric column and aerial telescope, in which he advanced opinions so little in unison with the latest discoveries of the day, that the council deemed it inexpedient to admit them into the *Transactions*. The paper was afterwards published in Nicholson's *Journal* (xxvi.), and the dry column described in it was constructed by various experimental philosophers. This dry pile or electric column has been regarded as his chief discovery.

Many other of his papers on subjects kindred to those already mentioned are to be found in the *Transactions* and in the *Philosophical Magazine*. See *Philosophical Magazine* (November 1817).

**DELUCE, THE** (through the Fr. *délire*, *diluvium, flood, diluere*, to wash away), a great flood or submersion of the earth (so far as the earth was known to the narrators), or of heaven and earth, or simply of heaven, by which, according to primitive and semi-primitive races, chaos was restored. It is, of course, not meant that all the current flood stories, as they stand, answer to this description. There are flood stories which, at first sight, may plausibly be held to be only exaggerated accounts of some ancient historical occurrences. The probability of such traditions being handed down is, however, extremely small. If some flood stories are apparently local, and almost or quite without mythical colouring, it may be because the original myth-makers had a very narrow conception of the earth, and because in the lapse of time the original mythic elements had dwindled or even disappeared. The relics of the traditional story may then have been adapted by scribes and priests to a new theory. Many deluge stories may in this way have degenerated. It is at any rate undeniable that flood stories of the type described above, and even with similar minor details, are fairly common. A conception of illustrative flood stories from different parts of the world would throw great light on the problems before us; see the article *Cosmogony*, especially for the North American tales, which show clearly enough that the deluge is properly a second creation, and that the serpent is as truly connected with the second chaos as with the first. One of them, too, gives a striking parallel to the Babylonian name *Hastis-andra* (the Very Wise), whence comes the corrupt form Xisuthrus, the deluge hero of the Hare Indians is called Kunyan, "the intelligent." Polynesia also gives us most welcome assistance, for its flood stories still present clear traces of the primitive imagination that the sky was a great blue sea, on which the sun, moon and stars (or constellations) were voyagers. Greece too supplies some stimulus to thought, nor are Iran and Egypt as unproductive as some have supposed. But the only pauses that we can allow ourselves are in Hindustan, Babylonia and Canaan. The peoples of these three countries, which are religiously so prominent in antiquity, have naturally connected their name equally with thoughts about earth production and earth destruction.

The Indian tradition exists in several forms.1 The earliest is preserved in the *Satapatha Brahmana*. It is there related that Manu, the first man, the son of the sun-god Visvasat, found, in bathing, a small fish, which asked to be tended, and in reward promised to save him in the coming flood. The fish grew, and at last had to be carried to the sea, where it revealed to Manu the time of the flood, and bade him construct a ship for his deliverance. When the time came, Manu, unaccompanied, went on board; the grateful fish towed the ship through the water to the summit of the northern mountain, where it bade Manu bind the vessel to a tree. Gradually, as the waters fell, Manu descended the mountain; he then sacrificed and prayed. In a year's time his prayer was granted. A woman appeared, who called herself his daughter Idi (goddess of fertility). It is neither stated, nor even hinted, that sin was the cause of the flood.

Another version occurs in the great epic, the *Mahabharata*. The lacunae of the earlier story are here supplied. Manu, for instance, embarks with the seven "richis" or wise men, and takes with him all kinds of seed. The fish announces himself as the God Brahman, and enables Manu to create both gods and

---

men. A third account is given in the Bhāgavata Purāṇa. It contains the details of the announcement of the flood seven days beforehand (cf. Gen. vii. 4) and of the taking of pairs of all kinds of animals (cf. Gen. vi. 19), besides the seeds of plants (as the epic; cf. Gen. vi. 21). This story, however, is a late composition, not earlier than the 12th century a.D. A first glance at these stories is somewhat bewildering. We shall return, however, to this problem later with a good hope of mastering it.

The Israelite (Biblical) and the Babylonian deluge-stories remain to be considered. Neither need be described here in detail; for the former see Gen. vi. 5-ix. 17, and for the latter Gilgamesh. As most students are aware, the Biblical deluge-story is composite, being made up of two narratives, the few lacunae in which are due to the ancient redactor who worked them together.1 The narrators are conventionally known as J. (= the Yahwist, from the divine name Yahweh) and P. (= the Priestly Writer) respectively. It is important to notice that P., though chronologically later than J., reproduces certain elements which must be archaic. For instance, while J. speaks only of a rain-storm, P. states that “all the fountains of the great ocean were broken up, and the windows of heaven opened” (Gen. vii. 11), i.e. the lower and the upper waters met together and produced the deluge. It is also P. who tells the story of the appointment of the rainbow (Gen. ix. 12-17), which is evidently ancient, though only paralleled in a Lithuanian flood-story, and near it we find the divine declaration (Gen. ix. 2-6) that the golden age of universal peace (cf. Gen. i. 29, 30), already sadly tarnished, is over.2 Surely this too has a touch of the archaic; nor can we err in connecting it with the tradition of man’s first home in Paradise, where no enemy could come, because, in the original form of the tradition, Paradise was the abode of God. (See Paradise.)

The Babylonian tradition exists in two main forms,3 nor can we affirm that the shorter form, due to Berossus, is superseded by the larger one in the Gilgamesh epic, for it communicates four important points: (1) Xisuthrus, the hero of the deluge, was also the tenth Babylonian king; cf. Noah, in P., the tenth patriarch as well as the survivor from the deluge; (2) the destination of Xisuthrus is said to be “to the gods” a statement which virtually records his divine character. In accordance with this, the final reward of the hero is declared to be “living with the gods.” This suggests that Noah (7) may originally have been represented as a supernatural man, a demigod. True, Gen. ix. 20, 21 is not consistent with this, but it is very possible that Noah was substituted by a scribe’s error for Enosh,4 who, like Xisuthrus, “walked with God (learning the heavenly wisdom) and disappeared, for God had taken him” (Gen. v. 22, 24); (3) the birds, when sent out by Xisuthrus the second time, return with mud on their feet. This detail reminds us of points in some archaic North American myths which probably supply the key to its meaning;5 (4) in the time of Berossus the mountain on which the ark grounded was considered to be in Armenia.

We pass on to the relation of J. and P. to the Babylonian story. (1) The polemical colouring of the latter contrasts strongly with the far simpler religious views of J. and P. Note the capricious character of the god Bel who sends the deluge, while at the end of the story the catastrophe is represented as a judgment upon human sins. It is the latter view which is adopted by J. and P. We cannot, however, infer from this that the narratives which doubtless underlie J. and P. were directly taken from some such story as that in the Gilgamesh epic. The theory of an indirect and unconscious borrowing on the part of the Israelitish compilers will satisfy all the conditions of the case. (2) In the general scheme the three accounts very nearly agree, for J. must originally have contained directions as to the building of the vessel, and a notice that the ark grounded on a certain mountain. P.’s omission of the sacrifice at the close seems to be arbitrary. His theory of religious history forbade a reference to an altar so early, but his document must have contained it. J. expressly mentions it (Gen. viii. 21, 22), though not in such an original way as the cuneiform text. (3) As to the directions for building the ship (epic) or chest (J. and P.). Here the Babylonian story and P. have a strong general resemblance; note, e.g., the mention of bitumen in both. Whether the Hebrew reference to a chest (idubh) is, or is not, more archaic than the Babylonian reference to a ship (elippa) is a question which admits of different answers. (4) As to the material cause of the deluge. According to P. (see above) the water came both from above and from below; J. only speaks of continuous rain. The Gilgamesh epic, however, mentions besides thunder, lightning and rain, a hurricane which drove the sea upon the land. We can hardly regard this as more original than P.’s representation. (5) As to the extent of the flood. From the opening of the story in the epic we should naturally infer that only a single S. Babylonian city was affected. The sequel, however, implies that the flood extended all over Babylonia and the region of Nisîr. More than this can hardly be claimed. Similarly the earlier story which underlies J. and P. need only have referred to the region of the myth-framers, i.e. either Canaan or N. Arabia. (6) As to the duration of the flood the traditions differ. P. reckons it at 365 days, i.e. a solar year, which is parallel to the 365 years of the life of Enoch (who, as we have seen, may have been the original hero of the flood). It is probable (see below) that P.’s ultimate authority, far back in the centuries, represented the deluge as a celestial occurrence.

The origin of J.’s story is not quite so clear, owing to the lacunae in the narrative. If the text may be followed, this narrator made the flood last forty days and nights, after which two periods of seven days elapse, and then the patriarch leaves the ark. The epic shortens the duration of the flood to seven days, after which the ship remains another seven days (more strictly six full days) on the mountain of the land of Nisîr (P., the mountains of Annar; J., unrecorded). (7) As to the despatch of the birds. J. begins, the epic closes, with the raven. Clearly the epic is more original. Besides, one of the two missions of the dove is evidently superfluous. Dove, swallow, raven, as in the epic, must be more primitive than raven, dove, dove.

That the Hebrew deluge-story in both its forms has been at least indirectly influenced by the Babylonian is obvious. We cannot indeed reconstruct the form either of the Canaanitish (or N. Arabian) story, which was recast partly at least under the influence of a recast Babylonian myth, nor can we conjecture where the sanctuaries was, the priests of which, yielding to a popular impulse, adopted and modified the fascinating story. But the fact of the ultimate Babylonian origin of the Israelitish myth is not inconsistent with the Hebrew. The Canaanites and N. Arabians handed on at least a portion of their myths to the Israelites, and the creation and deluge stories were among these. That the Israelitish priests gradually recast them is an easy and altogether satisfactory conjecture.

It remains to ask, What is the history and significance of the deluge-myth? The question carries us into far-off times. We have no version of the Babylonian myth which goes back to about 2100 B.C., while its text was apparently derived from a still older tablet. But even this is not primitive; behind it there must have been a much shorter and simpler myth. The recast represented by the existing versions of the myth must have been produced partly by the insertion, partly by the omission or modification, of mythic details, and by the application to the story thus produced of a particular mythic theory respecting the celestial world. The shorter myth referred to may—if we take hints from the very primitive myths of N. America—have run somewhat thus,
omitting minor details: "The earth (a small enough earth, doubtless) and its inhabitants proved so imperfect that the benevolent Being (or superhuman Being, who had created it, or perhaps another such Being, determined to remake it. He, therefore, summoned the serpent or dragon who controlled the cosmic ocean, and had been subjugated at creation, to overwhelm the earth, after which the creator remade it better, and the survivor and his family became the ancestors of a new human race."

This, however, is only one possible representation. It may have been said that the serpent of his own accord, not having been killed by the creator, maliciously flooded the earth (cf. the Algonquian myth), but was again overcome in battle, or that the serpent, after filling the earth with violence and wrong, was at length slain by the Good Being, and that his blood, streaming out, produced a deluge. In any case it is unnatural to hold that the first flood (that which preceded creation) had a dragon, but not the second. An old cuneiform text, recopied late, however, appears to call the year of the deluge (i.e. of what we here call the second flood) the year of the raging (or red-shining) serpent; and certainly the N. American myths distinctly connect serpents with the deluges.

Focusing on the probable minor details (omitted above) of the presumptive second flood, the deluge with which we may include: (1) the warning of "Very-Wise," either by friendly animals or by a dream; (2) the construction of a chest to contain "Very-Wise," his wife and his sons, together with animals; (3) the despatch of three birds with a special object (see below); (4) the landing of the survivors on a mountain. As to (1), Berossus suggests that the notice came to Xisuthrus in a dream; in the Indian myth it is the sacred fish which warns Manu. In the archaic N. American myths, however, it is some animal which gives the notice—an eagle or a coyote (a kind of wolf). As to (2), nothing is more common than the story of a divine child cast into the sea in a box. The ship-motive is also found, but it is not too rash to assume that the box-motive is the earlier, and, in accordance with the parallels, that the hero of the deluge was originally a god or a demigod. The translation of the hero to be with the gods is a transparent modification of the original tradition. As to (3), the original object of sending out the birds was probably not to find out where dry land was, but to use them as helpers in the work of re-colonisation. Take the story of the Thlatilas Indians, where the drowning earth sends out birds with the promise of a fir-tree, out of which Omeatl made mountains, earth and heaven; so, too, the Caingangs relate that those who escaped from the flood, as they tarried on a mountain, heard the song of the saracera birds, who came carrying earth in baskets, and threw it into the waters, which slowly subsided. As to (4), the mountain would naturally be thought of as a place of refuge even in the old, simple flood-story. But when Babylonian mythology effected an entrance, the mountain would receive a new and much grander significance. It would then come to represent the summit of that great and most holy mountain, which, save by the special favour of the gods, no human eye has seen. That a didactic element entered the deluge-tradition but slowly, may be surmised, not only from the genuinely old N. American stories, but from the inconsistent statements, to which Jastrow has already referred, in the Babylonian story. We may imagine that between the creation and the deluge some great and wise Being had initiated the early men, not only in the necessary arts of life, but in the "ways" that were pleasing to the heavenly powers. In the Babylonian case, apparently think of neglected sacrifices, the Australians of a desecrated mystery as the cause of the flood. Some such violation of a sacred rite is the origin that naturally occurs to an adapter or expander of primitive myths.

And now as to the application of the celestial mythic theory to the early deluge-story. In the agricultural stage it was natural that men should take a deeper interest than before in the appearance of the sky, and especially of the sun and moon, and of the constellations, even though an astronomical science or quasi-science would very slowly, if at all, grow up. That the Polynesian myths (which show no vestige of science) originally referred to the supposed celestial ocean, seems to be plain. Schirren 10 regarded the New Zealand cosmogonies as myths of sunrise, and the deluge-stories as myths of sunset. We may at any rate plausibly hold, with the article "Deluge" (by Cheyne) in the ninth edition of this work 11 (1877), that the deluge-stories of Polynesia and early Babylonia (we may now probably add India) were accommodated to an imaginative conception of the sun and moon as voyagers on the celestial ocean. "When this story had been told and retold a long time, rationalism suggested that the sea was not in heaven but on earth, and observation of the damage wrought in winter by excessive rains and the inundations of great rivers suggested the introduction of corresponding details into the new earthly deluge-myth." 12 This accounts for the strongly mythological character of "Ut-napishti" (Ut-napishti) in Babylon and Maui in New Zealand, who are in fact god-personages. Enoch, too, must be classed in this category, his personage being of supernatural wisdom now first become intelligible. Moreover, we now comprehend how the goddess Sabitu (the guardian of the entrance to the sea) can say to Gilgamesh (himself a solar personage), "Shamash the mighty (i.e. the sun-god) has crossed the sea; besides (?) Shamash, who can cross it?" For though the sea in the epic is no doubt the earth-circling ocean, it was hardly this in the myth from which the words were taken. 13 And, what is still more important, we can understand better how, in the Gilgamesh epic (lines 115-116), the gods, after cowing like dogs, go up to the "heaven of Ana." They, too, fear the deluge, and only in the highest heaven can they feel themselves secure.

Such an explanation seems indispensable if the wide influence of the Babylonian form of the deluge-myth is to be accounted for. As Gunkel well remarks, 14 neither the tenacity and self-propagating character of this myth, nor the solemn utterance of Yahweh (who corresponds to the Babylonian Marduk) in Gen. viii. 216 (J.) and ix. 8-17 (P.) can be understood, if the deluge-story is nothing more than this exaggerated account of a historical, earthly occurrence. We, therefore, think that it is an insufficient account to give of the story in the Gilgamesh epic, and that it is a combination of a local tradition of the destruction of a single city with a myth of the destruction of mankind—a myth exaggerated in its present form, but based on accurate knowledge of the yearly recurring phenomenon of the overflow of the Euphrates. 15 There are no doubt points in the story as it now stands which indicate a composite origin, but it is probable that even the tradition which apparently limits the destruction to a single city, equally with many other local flood-stories, has a basis in what we may fairly call a celestial myth.

We can now return with some confidence to the Indian deluge-story. It is unlikely that so richly gifted a race as the Aryans of India should not have produced their own flood-story out of the same primeval germ which grew up into the earliest Babylonian flood-story, 16 and almost inconceivable that in its second form the Indian story should not have become adapted to what may be called the celestial mythic theory.
theory. The phrase "the northern mountain" for the place where the ship grounded may quite well be the name of an earthly substitute (the epic has "the highest summit of the Himalaya") for the mythic mountain of heaven. Nor is it unimportant that Manu is the son of the sun-god, and that the phrase "the seven rishis" in classical Sanskrit is a designation of the seven stars of the Great Bear. For such problems all that we can hope for is a probable solution. The opposite view1 that the deluge is a historical occurrence implies a self-propagating power in early tradition which is not justified by critical research, and leaves out of sight many important facts revealed by comparative study.

For a conspectus of deluge-stories see Andre, Die Flusssagen, ethnographisch betrachtet (1891), by a competent anthropologist: E. Sues, Face of the Earth, i. 17 (1904); also Elwood Worcester, Genesis in the Light of Modern Knowledge (New York, 1901), Appendix ii, in tabular form, from Schwarz's Sinistfluth and Völkerwandlungen. Dr Worcester's work is popular, but based on well-chosen authorities. The article 'Flood' in Hastings' D. B. is comprehensive; it represents the different view that flood-stories, &c., are generally highly-coloured traditions of genuine facts. (T. K. C.)

DELYANNI, THEODOROS (1826-1905), Greek statesman, was born at Kalavryta, Peloponnesus, in 1826. He studied law at Athens, and in 1843 entered the ministry of the interior, of which department he became permanent secretary in 1859. In 1862, on the deposition of King Otho, he became minister for foreign affairs in the provisional government. In 1867 he was minister at Paris. On his return to Athens he became a member of successive cabinets in various capacities, and rapidly collected a party around him consisting of those who opposed his great rival, Tricoupi. In the so-called "Oecumenical Ministry" of 1877 he voted for war with Turkey, and on its fall he entered the cabinet of Koumoundoros as minister for foreign affairs. He was a representative of Greece at the Berlin Congress in 1878. From this time forward, and particularly after 1882, when Tricoupi again came into power at the head of a strong party, the duel between these two statesmen was the leading feature of Greek politics. (See GREECE: History.) Delyanni first formed a cabinet in 1885; but his warlike policy, the aim of which was, by threatening Turkey, to force the powers to make concessions in order to avoid the risk of a European war, ended in failure. For the powers, in order to stop his excessive armaments, eventually blockaded the Piraeus and other ports, and this brought about his downfall. He returned to power in 1890, with a radical programme, but his failure to deal with the financial crisis produced a conflict between him and the king, and his disrespectful attitude resulted in his summary dismissal in 1892. Delyanni, by his demagogic behaviour, evidently expected the public to side with him; but at the elections he was badly beaten. In 1894 he became premier minister, and, at the head of affairs during the Cretan crisis and the opening of the war with Turkey in 1897. The humiliating defeat which ensued —though Delyanni himself had been led into the disastrous war policy to some extent against his will—caused his fall in April 1897, the king again dismissing him from office when he declined to resign. Delyanni kept his own seat at the election of 1899, but his following dwindled to small dimensions. He quickly recovered his influence, however, and he was again president of the council and minister of the interior when, on the 13th of June 1905, he was murdered in revenge for the rigorous measures taken by him against gambling houses.

The main fault of Delyanni as a statesman was that he was unable to grasp the truth that the prosperity of a state depends on its adapting its ambitions to its means. Yet, in his vast projects, which the powers were never likely to endorse, and with their recent representment all the real wishes and aspirations of his countrymen, and his death was the occasion for an extraordinary demonstration of popular grief. He died in extreme poverty, and a pension was voted to the two nieces who lived with him.

DEMADES (c. 380-318 B.C.), Athenian orator and demagogue. He was originally of humble position, and was employed at one time as a common sailor, but he rose partly by his eloquence and partly by his unscrupulous character to a prominent position at Athens. He espoused the cause of Philip in the war against Olynthus, and was thus brought into bitter and life-long enmity with Demosthenes, whom he at first supported. He fought against the Macedonians in the battle of Chaeronea, and was taken prisoner. Having made a favourable impression upon Philip, he was released together with his fellow-captives, and was instrumental in bringing about a treaty of peace between Macedonia and Athens. He continued to be a favourite of Alexander, and, prompted by a bribe, saved Demosthenes and the other obnoxious Athenian orators from his vengeance. It was also chiefly owing to him that Alexander, after the destruction of Thebes, treated Athens so leniently. His conduct in supporting the Macedonian cause, yet receiving any bribes that were offered by the opposite party, caused him to be heavily fined more than once; and he was finally deprived of his civil rights. He was reinstated (322) on the approach of Antipater, to whom he was sent as ambassador. Before setting out he persuaded the judges to pass sentence of death upon Demosthenes and his followers, who had fled from Athens. The result of his embassy was the conclusion of a peace greatly to the disadvantage of the Athenians. In 318 (or earlier), having been detected in an intrigue with Perdiccas, Antipater's opponent, he was put to death by Antipater at Pella, when entrusted with another mission by the Athenians. Demades was avaricious and unscrupulous; but he was a highly gifted and practised orator.

A fragment of a speech (Πρός δοκιμαστέας), bearing his name, in which he defends his conduct, is to be found in C. Müller's Oratores Attici, ii. 438, but its genuineness is exceedingly doubtful.

DEMACOGE (Gr. δημακογίς, from ἄγω, to lead, and δήμος, the people), a leader of the popular as opposed to any other party. Being particularly used with an invidious sense of a mob leader or orator, one who for his own political ends panders to the passions and prejudices of the people, the word has come to mean an unprincipled agitator.

DEMANTOID, the name given by Nils Gustaf Nordenskiöld to a green garnet, found in the Urals and used as a gem stone. As it possesses high refractive and dispersive power, it presents when properly cut great brilliancy and "fire," and the name has reference to its diamond-like appearance. It is sometimes known as "Uralian emerald," a rather unfortunate name inasmuch as true emerald is found in the Urals, whilst it not infrequently passes in trade as olivine. Demantoid is regarded as a lime-iron garnet, coloured probably by a small proportion of chromium. The colour varies in different specimens from a vivid green to a dull yellowish-green, or even to a brown. The specific gravity of an emerald-green demantoid was found to be 3.849, and that of a greenish-yellow specimen 3.854 (A. H. Church). The hardness is only 6.5, or lower even than that of quartz—a character rather adverse to the use of demantoid as a gem. This mineral was originally discovered as pebbles in the gold-washings at Nizhne Tagilsk in the Ural Mountains, and was afterwards found in the stream called Bobrovka, in the Sysertsk district on the western slope of the Urals. It occurs not only as pebbles but in the form of granular nodules in a serpentine rock, and occasionally, though very rarely, shows traces of crystal faces.

DEMARATUS (Doric Δημάρατος, Ionic Δημάρατος), king of Sparta of the Euryponid line, successor of his father Aristo. He is known chiefly for his opposition to his colleague Cleomenes I. (q.v.) in his attempts to make Isagoras tyrant in Athens and afterwards to punish Aegina for meddling. He did his utmost to bring Cleomenes into disfavour at home. Thereupon Cleomenes urged Leotychides, a relative and personal enemy of Demaratus, to claim the throne on the ground that the latter was not really the son of Ariston but of Agetus, his mother's first husband. The Delphic oracle, under the influence of Cleomenes' bribes, pronounced in favour of Leotychides, who became king (401 B.C.). Soon afterwards Demaratus fled to Darius, who gave him the cities of Pergamum, Teuthrania and Halisarna, where his descendants were still ruling at the beginning of the 4th century (Xen. Anabasis, ii. 1. 3, vii. 8. 17; Hellenica, iii. 1. 6); to these

1 Held by Franz Delitzsch, Dillmann and Lenormant.
DEMERARA—DEMETER

Those who were initiated into the mysteries of Eleusis found a deep meaning in the myth, which was told to teach the principles of a future life, founded on the return of Persephone to the upper world, or rather on the process of nature by which seed sown in the ground must first die and rot before it can yield new life (see MYSTERY). At Eleusis, Demeter was venerated as the introducer of all the blessings which agriculture brings in its train—fixed dwelling-places, civil order, marriage and a peaceful life; hence her name Themisphoros, "the bringer of law and order," and the festival Thesmophoria (q.v.). J. G. Frazer tells the epitaph to mean "bearer of the sacred objects deposited on the altar"; L. R. Farnell (Cults of the Greek States, iii. 106) suggests "the bringer of treasure or riches," as appropriate to the goddess of corn and of the lower world; others refer the name to "the law of wedlock" (Θέμις Νόμιμος, Odyssey, xxii. 296, where, however, D. B. Monro translates "place, situation"). At Eleusis also, Tripolemus (q.v.), the son of Celeus, who was said to have invented the plough and to have been sent by Demeter round the world to diffuse the knowledge of agriculture, had a temple and threshing-floor.

In the agrarian legends of Iasion and Erysichthon, Demeter also plays an important part. Iasion (or Iasius), a beautiful youth, inspired her with love for him in a thrice-ploughed field in Crete, the fruit of their union being Plutos (wealth). According to Homer (Odys. viii. 273), Demeter "the bright-eyed, the all-devouring" sent to Iasion a thorny bush which covered the land with thorns. The story is compared by Frazer (Golden Bough, 2nd ed., ii. 217) with the west Prussian custom of the mock birth of a child on the harvest-field, the object being to ensure a plentiful crop for the coming year. It seems to point to the supersession of a primitive local Cretan divinity by Demeter, and the adoption of agriculture by the inhabitants, bringing wealth in its train in the form of the fruits of the earth, both vegetable and mineral. Some scholars, identifying Iasion with Jason (q.v.), regard Thessaly as the original home of the legend, and the union with Demeter as the lepōs γαμος of mother earth with a health god. Erysichthon ("tearer up of the earth"), son of Triopas or Myrmon, having cut down the trees in a grove sacred to the goddess, was punished by her with terrible hunger (Callimachus, Hymn to Demeter; Ovid, Metam. viii. 738-787). Perhaps Erysichthon may be explained as the personification of the labourer, who by the systematic cultivation and tilling of the soil endeavours to force the crops, instead of allowing them to mature un molested as in the good old times. Tearing up the soil with the plough is regarded as an invasion of the domain of the earth-mother, punished by the all-devouring hunger for wealth, that threatens to destroy the produce of the earth. Erysichthon is the destroyer of trees, who wastes away as the plant itself loses its vigour. It is possible that the story may originally have been connected with tree-worship. Here again, as in the case of Iasion, a conflict between an older and a younger cult seems to be alluded to (for the numerous interpretations see O. Crusius s.v. in Roscher's Lexikon).

It is as a corn-goddess that Demeter appears in Homer and Hesiod, and numerous epithets from various sources (see Bruchmann, Epitheta Deorum, supplement to Roscher's Lexikon, i. 2) attest her character as such. The name Θησεία (Theséia) is often found, from Θησείας, "corn-sheaf," has been regarded as identifying the goddess with the sheaf, and as proving that the cult of Demeter originated in the worship of the corn-mother or corn-spirit, the last sheaf having a more or less divine character for the primitive husbandman. According to this view, the prototypes of Demeter and Persephone are the corn-mother and harvest maidens of northern Europe, the corn-fetishes of the field (Frazer, Golden Bough, 2nd ed., ii. 217, 222; see also Farnell, Cults, iii. 35). The influence of Demeter, however, was not limited to corn, but extended to vegetation generally and all the fruits of the earth, with the curious exception of the husbandman's cattle, the use of which was forbidden at Eleusis, and for the protection of which a special patron was invented. In this wider sense Demeter is akin to Ge, with whom she has several epithets in common, and is sometimes identified with Rhea-Cybele; thus Pindar speaks of Demeter ἴθελοκρότος ("brass-rattling"), an epithet obviously more

Gambriel should perhaps be added (Athenaeus i. 29 f.). He accompanied Xerxes on his expedition to Greece, but the stories told of the warning and advice which on several occasions he addressed to the king are scarcely history. See Herodotus v. 75, vi. 50-70. As late as Plutarch (M. Cenc.).

This demesne, land, originally held at the will of the lord, in course of time came to acquire fixity of tenure, and developed the modern copyhold (see MANOR). It is often from demesne as used in sense (a) that the modern restricted use of the word comes, i.e. land immediately surrounding the mansion or dwelling-house, the park or chase. Demesne of the crown, or royal demesne, was part of the crown lands not granted out to feudal tenants, but which remained under the management of stewards appointed by the crown. These crown lands, since the accession of George III., have been appropriated by parliament, the sovereign receiving in return a fixed annual sum (see CIVIL LIST). Ancient demesne signified lands or manors vested in the king at the time of the Norman Conquest. There were special privileges surrounding tenancies of these lands, such as freedom from tolls and duties, exemption from danegeld and amercement, from sitting on juries, &c. Hence, the phrase "ancient demesne" came to be applied to the tenure by which the lands were held. Land held in ancient demesne is sometimes also called customary freehold. (See COPYHOLD.)

DEMETER, in Greek mythology, daughter of Cronus and Rhea and sister of Zeus, goddess of agriculture and civilized life. Her name has been explained as (1) "granmother," from θησα, the Cretan form of ἱερά, "barley," or (2) "earth-mother," or rather "mother earth," being regarded as the Doric form of Μη. She is rarely mentioned in Homer, nor is she included amongst the gods of Olympus.

The central fact of her cult was the story of her daughter Persephone (Proserpine), a favourite subject in classical poetry. According to the Homeric hymn to Demeter, Persephone, while gathering flowers on the Nysian plain (probably here a purely mythical locality), was carried off by Hades (Pluto), the god of the lower world, with the connivance of Zeus (see also PROSERPINE). The incident has been assigned to various other localities—Crete, Eleusis, and Enna in Sicily, the last being most generally adopted. This rape is supposed to point, or to an original lepōs γαμος, an annual holy marriage of a god and goddess of vegetation. Wandering over the earth in search of her daughter, Demeter learns from Hades the truth about her disappearance. In the form of an old woman named Deo (= the "seeker," or simply a diminutive form), she comes to the house of Celeus at Eleusis, where she is hospitably received. Having revealed herself to the Eleusinians, she departs, in her wrath having visited the earth with a great dearth. At last Zeus appeases her by allowing her daughter to spend two-thirds of the year with him in the upper world. Demeter then returns to Olympus before her final departure from the earth in token of her gratitude, she instructs the rulers of Eleusis in the art of agriculture and in the solemnities and rites whereby she desires in future to be honoured.

1. The form "demesne" is an Anglo-French spelling of the Old Fr. demeine or demaine, belonging to a lord, from Med. Lat. dominicus, lord; dominicum in Med. Lat., meant proprietis (see Du Cange). From the later Fr. domaine, which approaches more nearly the original Lat., comes the other Eng. form "domain," which is chiefly used in a non-legal sense of any tract of country or district under the rule of any specific sovereign state, &c. "Domain" is, however, the form kept in the legal phrase "Eminent Domain" (q.v.).
suitable to the Asiatic than to the Greek earth-goddess. Although the goddess of agriculture is naturally inclined to peace and aversion from war, the memory of the time when her land was won and kept by the sword still lingers in the epithets χρυσόδορος and εξοφράδας and in the name Triptolemos, which probably means "thrice fighter" rather than "thrice plougher."

Another important aspect of Demeter was that of a divinity of the under-world; as such she is χειμών in Sparta and especially at Hermione in Argolis, where she had a celebrated temple, said to have been founded by Clymenus (one of the names of Hades-Pluto) and his sister Chthonia, the children of Phoroneus, an Argive hero. Here there was said to be a descent into the lower world, and local tradition made it the scene of the rape of Persephone. At the festival Chthonia, a cow (representing, according to Mannhardt, the spirit of vegetation), which voluntarily presented itself, was sacrificed by three old women. Those joining in the procession wore garlands of hyacinth, which seems to attribute to a chthonian character to the ceremony, although it may also have been connected with agriculture (see S. Wide, De Sacr. Troescentiorum, Hermion. Ephes. (Upsala, 1888). The striking use of the term ἀνθήρειος in the sense of "the dead" may be noted in this connexion.

The remarkable epithets, ἔρωτις and Μήλαμη, as applied to Demeter, were both localized in Arcadia, the first at Thelpusa (or rather Onkeion close by), the second at Phigalia (see W. Immerwahr, Die Kulte und Mythen Arcadiens, 1891). According to the Thelpusan story, Demeter, during her wanderings in search of Persephone, changed herself into a mare to avoid the persecution of Poseidon. The god, however, assumed the form of a stallion, and the fruit of the union was a daughter of mystic name and the horse Areon (or Erion). Demeter, at first enraged, afterwards calmed down, and washed herself in the river Ladon by way of purification. Demeter "the angry" (ἦρωτις) became Dæmetre, "the bather" (Ἀδεμέτρη). An almost identical story was current in the neighbourhood of Taphospha, a Boeotian spring. In the Phigalian legend, no mention is made of the horse Areion, but only of the daughter, who is called Despoina (mistress), a title common to all deities connected with the under-world. Demeter, clad in black (hence μήλαμη) in token of mourning for her daughter and wrath with Poseidon, retired into a cave. During that time the earth bore no fruit, and the inhabitants of the world were threatened with starvation. At last Pan, the old god of Arcadia, discovered her hiding-place, and informed Zeus, who sent the Moirae (Fates) to fetch her out. The cave, still called Mavropélyia ("black cave"), was ever afterwards regarded as sacred to Demeter, and in it, according to information given to Pausanias, there had been set up an image of the goddess, a female form seated on a rock, but with a horse's head and mane, to which were attached snakes and other wild animals. It was clothed in a black garment reaching to the feet, and held in one hand a dolphin, in the other a dove. The image was destroyed by fire, replaced by the sculptor Onatas from inspiration in a dream, but disappeared again before the time of Pausanias.

Both μήλαμη and ἔρωτις, according to Farnell, are epithets of Demeter as an earth-goddess of the under-world. The first has been explained as referring to the gloom of her abode, or the blackness of the withered corn. The second, according to Max Müller and A. Kuhn, is the etymological equivalent of the Sanskrit Saranyu, who, having turned herself into a mare, is pursued by Vivasvat, and becomes the mother of the two Asvins, the Indian Dioscuri, the Indian and Greek myths being regarded as identical. According to Farnell, the meaning of the epithet is to be looked for in the original conception of Erynis, which was that of an earth-goddess akin to Ge, thus naturally associated with Demeter, rather than that of a wrathful avenge deity.

Alcman has an epitaphic form of the Black Demeter: (1) that the horse was one of the forms of the corn-spirit in ancient Greece; (2) that it was an animal "devoted" to the chthonian goddess; (3) that it is totemistic; (4) that the form was adopted from Poseidon Hippios, who is frequently associated with the earth-god and is said to have received the name Hippios first at Thelpusa, in order that Demeter might figure as the mother of Areion (for a discussion of the whole subject see Farnell, Cults, iii. pp. 50-63). The union of Poseidon and Demeter is thus explained by Mannhardt. As the waves of the sea are fancifully compared to horses, so a field of corn, waving in the breeze, may be said to represent the wedding of the sea-god and the corn-goddess. In any case the association of Poseidon, representing the fertilizing element of moisture, with Demeter, who causes the plants and seeds to grow, is quite natural, and seems to have been widespread.

Demeter also appears as a goddess of health, of birth and of marriage; and a certain number of political and ethnic titles is assigned to her. Of the latter the most noteworthy are: Παραγεια at Aegium in Achaea, pointing to some connexion with the Achaean league; ᾿Αχαια, "the Achaean goddess," unless it refers to the "sorrow" of the goddess for the loss of her daughter (cf. ᾿Αχαια in Boeotia); and, most of all, Αὐχαείς, at Anthela near Thermopylae, as patron-goddess of the Amphilochian League, subsequently so well known in connexion with the temple at Delphi.

The Eleusinia and Thesmophoria are discussed elsewhere, but brief mention may here be made of certain agrarian festivals held in honour of Demeter.

1. Halos, obviously connected with ἀλώς ("threshing-floor"), begun at Athens and finished at Eleusis, where there was a threshing-floor of Triptolemos, in the month Poseidon (December). This date, which is confirmed by historical and epigraphical evidence, seems inappropriate, and it is suggested (A. Mommmsen, Feste der Stadt Athen, p. 365 foll.) that the festival, originally held in autumn, was subsequently placed later, so as to synchronize with the winter Dionysia. Dionysus, as the god of vines, and (in a special procession) Poseidon ἄρταμως ("god of vegetation") were associated with Demeter. In addition to being a harvest festival, marked by the ordinary popular rejoicing of the Halos had a religious character. The ἄραμαχα ("first fruits") were conveyed to Eleusis, where sacrifice was offered by a priestess, men being prohibited from undertaking the duty. A ἄραμαχα ("initiatory ceremony") of women by a woman also took place at Eleusis, characterized by obscene jests and the use of phallic emblems. The sacramental meal on this occasion consisted of the produce of land and sea, certain things (pomegranates, honey, eggs) being forbidden for mystical reasons. Although the offerings at the festival were bloodless, the ceremony of the presentation of the ἄραμαχα was probably accompanied by animal sacrifice (Farnell, Foucart); Mommmsen, however, considers the offerings to have been paean imitations. Certain games (ῥάπαρα ἄγων), of which nothing is known, terminated the proceedings. In Roman imperial times the ephedr had to deliver a speech at the Halos.

2. Chloe or Chloea, the festival of the corn beginning to sprout, held at Eleusis in the early spring (Anthebesterion) in honour of Demeter Chloé, "the green," the goddess of growing vegetation. This is to be distinguished from the later sacrifice of a ram to the same goddess on the 6th of the month Thargelion, probably intended as an act of propitiation. It has been identified with the Procharistia (sometimes called Procharisteria), another spring festival, but this is doubtful. The scholiast on Pindar (Ol. ix. 150) mentions an Athenian harvest festival Eucharistia.

3. Proerisia, at which prayers were offered for an abundant harvest, before the land was ploughed for sowing. It was also called Proaristia, an indication that it was held before the rising of Arcturus. According to the traditional account, when Greece was threatened with famine, the Delphic oracle ordered first-fruits to be brought to Athens from all parts of the country, which were to be offered by the Athenians to the goddess Demeter in the temple at Eleusis. For all the contributors. The most important part of the festival was the three sacred ploughings—the Athenian ἄραμαχα, the Eleusinian on the Rhamian plain, the Scirion (a compromise between Athens and Eleusis). The festival itself

1 O. Gruppe (Griechische Mythologie, ii. 1177, note 1) considers it certain that Αχαια = ἀρπαγεια, although he is unable to explain the form.
took place, probably some time in September, at Eleusis. In later times the ephebi also took part in the Prostoria.

4. *Thalysia*, a thanksgiving festival, held in autumn after the harvest in the island of Cos (see Theocritus vii.).

5. The name of Demeter is also associated with the *Scerophoria* (see Athena). It is considered probable that the festival was originally held in honour of Athena, but that the growing importance of the Eleusinia caused it to be attached to Demeter and Kore.

The attributes of Demeter are chiefly connected with her character as goddess of agriculture and vegetation—ears of corn, the poppy, the mystic basket (calathus) filled with flowers, corn and fruit of all kinds, the pomegranate being especially common. Of animals, the cow and the pig are her favourites, the latter owing to its productivity and the cathartic properties of its blood. The crane is associated with her as an indicator of the weather. As a chthonian divinity she is accompanied by a snake; the myrtle, asphodel and narcissus (which Persephone was gathering when carried off by Hades) also are sacred to her.

In Greek art, Demeter is made to resemble Hera, only more matronly and with a mild expression; her form is broader and fuller. She is sometimes represented in a chariot drawn by her two dragons, sometimes walking, sometimes seated upon a throne alone or with her daughter. The Demeter of Cnidus in the British Museum, of the school of Praxiteles, apparently shows her mourning for the loss of her daughter. The article Greek art, fig. 67 (pl. iv.), gives a probable representation of Demeter (or her priestess) from the stone of a vault in a Cretan grave.

The Romans identified Demeter with their own Ceres (q.v.).

**DEMETRIA—DEMIETRUS**

A Greek festival in honour of Demeter, held at seed-time, and lasting ten days. Nothing is known of it beyond the fact that the men who took part in it lashed one another with whips of bark (μπορτοτ), while the women made obscene jests. It is even doubtful whether it was a particular festival at all or only another name for the Eleusinia or Thesmophoria. The Dionysia also were called Demetria in honour of Demetria Poliorcetes, upon whom divine honours were conferred by the Athenians.

Hetyschi, s.v. μπορτοτ; Politi s. 37; Diod. Sic. v. 4; Plutarch, *Demetria*, 12; Darenberg and Saglio, *Dictionnaire des antiquités*.

**DEMIETRUS**, king of Bactria, was the son of the Graeco-Bactrian king Euthydemus, for whom he negotiated a peace with Antiochus the Great in 206 (Polyb. xi. 34). Soon afterwards he crossed the Hindu Kush and began the invasion of India (Strabo xi. 553). He crossed the Indus and conquered the other Kathaeans in the Punjab (Arrian v. 22, 2 fl.), after he named his father Euthydemus (Ptol. vii. 1, 46). That his power extended into Arachosia (Afghanistan) is proved by the name of a town Demetrias near Kand NASAH (Iaurid, Charac. 19, cf. Strabo vi. 516). On his coins he wears an elephant’s skin with trunk and teeth on his head; on bronze coins, which have also an Indian legend in Kharoshti letters (see Bactria), he calls himself the unvanquished king (*Batojāk kṣatruḥ Dāyiśvarī*). One of his coins has already the square form used in India instead of the circular. Eventually he was defeated by the usurper Eucratides (p. 293), who meanwhile had risen to great power in Bactria. About his death we know nothing; his young son Euthydemus II. (known only from coins) can have ruled only a short time. (Ed. M.)

**DEMIETRIS**, the name of two kings of Macedonia.

1. **DEMIETRIS I.** (337–283 B.C.), surnamed *Poliorcetes* (“Besieger”), son of Antigonus Cyclops and Statrane. At the age of twenty-two he was left by his father to defend Syria against Ptolemy the son of Lagos; he was totally defeated near Gaza (322), but soon partially repaired his loss by a victory in the neighbourhood of Myus. After an unsuccessful expedition against Babylon, in several campaigns against Ptolemy on the coasts of Cilicia and Cyprus, Demetrius sailed with a fleet of 250 ships to Athens. He freed the city from the power of Cassander and Ptolemy, expelled the garrison which had been stationed there under Demetrius of Phalerum, and besieged and took Munchia (307). After these victories he was worshipped by the Athenians as a tutelary deity under the title of *Soler* (“Preserver”). In the campaign of 306 against Ptolemy he defeated Menelaus (the brother of Ptolemy) in Cyprus, and completely destroyed the naval power of Egypt. In 305 he endeavoured to punish the Rhodians for having deserted his cause; and his ingenuity in devising new instruments of siege, in his unsuccessful attempt to reduce the capital, gained him the appellation of Poliorcetes. He returned a second time to Greece as liberator. But his licentiousness and extravagance made the Athenians regret the government of Cassander. He soon, however, roused the jealousy of the successors of Alexander; and Seleucus and Cassander and Lysimachus united to destroy Antigonus and his son. The hostile armies met at Issus in Phrygia (301). Antigonus was killed in the battle, and Demetrius, after sustaining a severe loss, retired to Ephesus. He then received a Desmond from Phœnicians against him; and the Athenians refused even to admit him into their city. But he soon afterwards ravaged the territory of Lysimachus, and effected a reconciliation with Seleucus, to whom he gave his daughter Stratone in marriage. Athens was at this time oppressed by the tyranny of Lachares; but Demetrius, after a protracted blockade, gained possession of the city (294) and pardoned the inhabitants their former misconduct. In the same year he established himself on the throne of Macedonia by the murder of Alexander, the son of Cassander. But here he was continually threatened by Ptolemy, who took advantage of his occasional absence to ravage the defenceless part of his kingdom (Plutarch, *Pyrrhus*, 7 fl.), and at length the combined forces of Ptolemy, Ptolemy and Lysimachus, assisted by the disaffected among his own subjects, obliged him to leave Macedonia after he had sat on the throne for six years (294–288). He passed into Asia, and attacked some of the provinces of Lysimachus with some success; but famine and pestilence destroyed the greater part of his army, and he was defeated by Seleucus for support and assistance. But before he reached Syria hostilities broke out; and after he had gained some advantages over his son-in-law, Demetrius was totally forsaken by his troops on the field of battle, and surrendered his person to Seleucus. His son Antigonus offered all his possessions, and even his person, in order to procure his father’s liberty; but all proved unavailing, and Demetrius died in the fifty-fourth year of his age, after a confinement of three years (283). His remains were given to Antigonus, honoured with a splendid funeral at Corinth, and thence conveyed to Demetrias. His posticity remained in possession of the Macedonian throne till the time of Perseus, who was conquered by the Romans.

2. **DEMIETRIS II.**, son of Antigonus Gonatas, reigned from 239 to 229 B.C. He had already during his father’s lifetime distinguished himself by defeating Alexander of Epirus at Derdia and so saving Macedonia (about 260?). On his accession he had to face a coalition which the two great leagues, usually rivals, the Aetolian and Achaean, formed against the Macedonian power. He succeeded in dealing this coalition severe blows, wresting Boeotia from their alliance. The revolution in Epirus, which substituted a republican league for the monarchy, gravely weakened his position. Demetrius had also to defend Macedonia against the wild peoples of the north. A battle with the Danarians turned out disastrously, and he died shortly afterwards,
leaving Philip, his son by Chryséis, still a child. Former wives of Demetrius were Statonice, the daughter of the Seleucid king Antiochus I., Pthia the daughter of Alexander of Epirus, and Nicaea, the widow of his cousin Alexander. The chronology of these marriages is a matter of dispute.

DEMETRIUS, the name of three kings of Syria.

DEMETRIUS I. (d. 150 B.C.), surnamed Soter, was sent to Rome as a hostage during the reign of his father, Seleucus IV. Philopator, but after his father's death in 175 B.C. he escaped from confinement, and established himself on the Syrian throne (162 B.C.) after overthrowing and murdering King Antiochus V. Eupator. He acquired his surname of Soter, or Saviour, from the Babylonians, whom he delivered from the tyranny of the Satrap, Timaus, and is famous in Jewish history for his contests with the Maccabees. Hated for his vices, Demetrius fell in battle against the usurper, Alexander Balas, in 150 B.C.

DEMETRIUS II. (d. 153 B.C.), surnamed Nicator, son of Demetrius I., fled to Crete after the death of his father, but about 147 B.C. he returned to Syria, and with the help of Ptolemy VII. Philometer, king of Egypt, regained his father's throne. In 140 B.C. he marched against Mithradates, king of Parthia, but was taken prisoner by treachery, and remained in captivity for ten years, regaining his throne about 132 B.C. on the death of his brother, Antiochus VII., who had usurped it. His cruelties and vices, however, caused him to be greatly detested, and during another civil war he was defeated in a battle at Damascus, and killed near Tyre, possibly at the instigation of his wife, a daughter of Ptolemy VII., who was indignant at his subsequent marriage with a daughter of the Parthian king, Mithradates. His successor was his son, Antiochus VIII. Grypus.

DEMETRIUS III. (d. 88 B.C.), called Euergetes and Philometor, was the son of Antiochus VIII. Grypus. By the assistance of Ptolemy X. Lathyrus, king of Egypt, he recovered part of his Syrian dominions from Antiochus X. Eusebes, and held his court at Damascus. In attempting to dethrone his brother, Philip Epiphanes, he was defeated by the Arabs and Parthians, was taken prisoner, and kept in confinement in Parthia by King Mithradates until his death in 88 B.C.

DEMETRIUS, a Greek sculptor of the early part of the 4th century B.C., who is said by ancient critics to have been notable for the life-like realism of his statues. His portrait of Pellicthus, a Corinthian general, "with fat paunch and bald head, wearing a cloak which leaves him half exposed, with some of the hairs of his head flowing in the wind, and prominent veins," was admired by Lucian. He was contrasted with Ceresias, an idealizing sculptor of the generation before. Since however the peculiarities mentioned by Lucian do not appear in Greek portraits before the 3rd century B.C. and since the Greek art of the 4th century consistently idealizes, there would seem to be a difficulty to explain. The date of Demetrius above given is confirmed by inscriptions found on the Athenian Acropolis. (P. G.)

DEMETRIUS, a Cynic philosopher, born at Sunium, who lived partly at Corinth and later in Rome during the reigns of Caligula, Nero and Vespasian. He was an intimate friend of Thrasea Paetus and Seneca, and was held in the highest estimation for his consistent disregard of creature comfort in the pursuit of virtue. His contempt for worldly prosperity is shown by his reply to Caligula who, wishing to gain his friendship, sent him a large present. He replied, "If Caligula had intended to bribe me, he should have offered me his crown." Vespasian banished him, but Demetrius laughed at the punishment and mocked the emperor's anger. He reached the logical conclusion of Cynicism in attaching no real importance to scientific data.

DEMETRIUS DONSKI (1350-1369), grand duke of Vladimir and Moscow, son of the grand duke Ivan Ivanovich by his second consort Aleksandra, was placed on the grand-ducal throne of Vladimir by the Tatar khan in 1362, and married the princess Eudoxia of Nizhniy Novgorod in 1364. It was now that Moscow was first fortified by a strong wall, or kreml (citadel), and the grand duke began "to bring all the other princes under his will." Michael, prince of Tver, appealed however for help to Olgerd, grand duke of Lithuania, who appeared before Moscow with his army and compelled Demetrius to make restitution to the prince of Tver (1360). The war between Tver and Vladimir continued intermittently for some years, and both the Tatars and the Lithuanians took an active part in it. Demetrius was generally successful in what was really a contention for the supremacy.

In 1371 he won over the Khan by a personal visit to the Horde, and in 1372 he defeated the Lithuanians at Lyubutsk. Demetrius then formed a league of all the Russian princes against the Tatars and in 1386 encountered them on the plain of Kulikovo, between the rivers Nepryadyava and Don, where he completely routed them, the grand khan Mamai perishing in his flight from the field. But now Tocktamish, the deputy of Tamerlane, suddenly appeared in the Horde and organized a punitive expedition against Demetrius. Moscow was taken by treachery, and the Russian lands were again subdued by the Tatars (1381). Nevertheless, while compelled to submit to the Horde, Demetrius maintained his hegemony over Tver, Novgorod and Moscow, but suffered from Russian principalities, and even held his own against the Lithuanian grand dukes, so that by his last testament he was able to leave not only his ancestral possessions but his grand-dukedom also to his son Basil. Demetrius was one of the greatest of the north Russian grand dukes. He was not merely a cautious and taciturn statesman, but also a valiant and capable captain, in striking contrast to most of the princes of his house.

See Sergey Solovey, History of Russia (Russ.), vols. i.-ii. (St. Petersburg, 1857), &c.: Nikolai Sevlev, Demetrius Ivanovich Donskoi (Russ.), (Moscow, 1837). (R. N. B.)

DEMETRIUS PHALERUS (c. 345-283 B.C.), Attic orator, statesman and philosopher, born at Phalerum, was a pupil of Theophrastus and an adherent of the Peripatetic school. He returned the city of Athens as representative of Cassander (q.v.) for ten years from 317. It is said that he so won the hearts of the people that 360 statues were erected in his honour; but opinions are divided as to the character of his rule. On the restoration of the old democracy by Demetrius Poliorcetes, he was condemned to death by the fickle Athenians and obliged to leave the city. He escaped to Egypt, where he was protected by Ptolemy Lagus, to whom he is said to have suggested the foundation of the Alexandrian library. Having incurred the displeasure of Lagus's successor Philadelphus, Demetrius was banished to Upper Egypt, where he died (according to some, voluntarily) from the bite of an asp. Demetrius composed a large number of works on poetry, history, politics, rhetoric and accounts of embassies, all of which are lost.

The treatise Ἐπιγραφαί (on rhetorical expression), which is often ascribed to him, is probably the work of a later Alexandrian (1st century A.D.) of the same name; it has been edited by L. Rademacher (1901) and W. Rhys Roberts (1902), the last-named providing English translation, introduction, notes, glossary and general bibliography. Fragment Ε in C. Müller, Prag. Hist. Grac. II. p. 362. See A. Holm, History of Greece, of the Later Ptolemies, (1369). (A. Holm.)

DEMETRIUS, PSEUDO- (or FALSE), the name by which three Muscovite princes and pretenders, who claimed to be Demetrius, son of Ivan the Terrible, are known in history. The real Demetrius had been murdered, while still a child, in 1591, at Uglich, his widowed mother's appanage.

1. In the reign of Tsar Boris Godunov (1598-1603), the first of these pretenders, whose origin is still obscure, emigrated to Lithuania and persuaded many of the magnates there of his tsarish birth, and consequently of his right to the Muscovite throne. His real name seems to have been Yury or Gregory, and he was the grandson of Bogdan Ostrepov, a Galician boyar, and a tool in the hands of Tsar Boris Godunov's enemies. He first appears in history circa 1600, when his learning and assurance seem to have greatly impressed the Muscovite patriarch Job. Tsar Boris, however, ordered him to be seized and examined, whereupon he fled to Prince Constantine Ostrogsky at Ostrog, and subsequently entered the service of another Lithuanian, Prince Winiwiecki, who accepted him for what he pretended
to be and tried to enlist the sympathy of the Polish king, Sigismund III., in his favour. The king refused to support him officially, but his cause was taken up, as a speculation, by the Polish magnate Yury Mniszek, whose daughter Marina he afterwards wedded and crowned as his tsaritsa. The Jesuits also seem to have believed in the man, who was evidently an unconscious impostor brought up from his youth to believe that he was the real Demetrius; numerous fugitives from Moscow also acknowledged him, and finally he set out, at the head of an army of Polish and Lithuanian volunteers, Cossacks and Muscovite fugitives, to drive out the Godunovs, after being received into the Church of Rome. At the beginning of 1604 he was invited to Cracow, where Sigismund presented him to the papal nuncio Rangoni. His public conversion took place on the 17th of April. In October the false Demetrius crossed the Russian frontier, and shortly afterwards routed a large Muscovite army beneath the walls of Novgorod-Syeversk. The sudden death of Tsar Boris (April 13, 1605) removed the last barrier to the further progress of the pretender. The principal Russian army, under P. F. Basmanov, at once went over to him (May 7); on the 20th of June he made his triumphal entry into Moscow, and on the 21st of July he was crowned tsar by a new patriarch of his own choosing, the Greek Isidore. He at once proceeded to introduce a whole series of political and economical reforms. From all accounts, he must have been a man of original genius and extraordinary resource. He did his best to relieve the burdens of the peasantry; he formed the project of a grand alliance between the emperor, the pope, Venice, Poland and Muscovy against the Turk; he displayed an amazing toleration in religious matters which made people suspect that he was a crypto-Arian; and far from being, as was expected, the tool of Poland and the pope, he maintained from the first a dignified and independent attitude. But his extravagant opinion of his own authority (he lost no time in styling himself emperor), and his predilection for Western civilization, alarmed the ultra-conservative boyars (the people were always on his side), and a conspiracy was formed against him, headed by Basil Shuisky, whose life he had saved a few months previously. A favourable opportunity for the conspirators presented itself on the 8th of May 1606, when Demetrius was married to Marina Mniszek. Taking advantage of the hostility of the Muscovites towards the Polish regiments which had escorted Marina to Moscow and there committed some excesses, the boyars urged the citizens to rise against the Poles, while they themselves attacked and slew Demetrius in the Kreml on the night of the 17th of May.

(St Petersburg, 1863, &c.); Orest Levitsky, The First False Demetrius as the Propugndist of Catholicism in Russia (Russ.) (St Petersburg, 1885); Paul Pierling, Rome et Demetrius (Paris, 1878); R. N. Bain, Poland and Russia, cap. 10 (Cambridge, 1907).

2. The second pretender, called "the thief of Tushino," first appeared on the scene circa 1607 at Starodub. He is supposed to have been either a priest's son or a converted Jew, and was highly educated, relatively to the times he lived in, knowing as he did the Russian and Polish languages and being somewhat of an expert in liturgical matters. He pretended at first to be the Muscovite boyarin Nagi; but confessed, under torture, that he was Demetrius Ivanovich, whereupon he was taken at his word and joined by thousands of Cossacks, Poles and Muscovites. He speedily captured Karachev, Bryansk and other towns; was reinforced by the Poles; and in the spring of 1608 advanced upon Moscow, routing the army of Tsar Basil Shuisky, at Bolkhov, on his way. Liberal promises of the wholesale confiscation of the estates of the boyars drew the common people to him, and he entrenched himself at the village of Tushino, twelve versts from the capital, which he converted into an armed camp, collecting therein 7000 Polish soldiers, 10,000 Cossacks and 10,000 of the rabble. In the course of the year he captured Marina Mniszek, who acknowledged him to be her husband (subsequently quieting her conscience by privately marrying this impostor, who in no way resembled her first husband), and brought him the support of the Lithuanian magnates Mniszek and Sapieha so that his forces soon exceeded 100,000 men. He raised to the rank of patriarch another illustrious captive, Philaret Romanov, and won over the towns of Yaroslav, Kostroma, Vologda, Kashin and other places to his allegiance. But a series of subsequent disasters, and the arrival of King Sigismund III. at Sinolensk, induced him to fly his camp disguised as a peasant and go to Kostroma, where Marina joined him and he lived once more in regal state. He also made another but unsuccessful attack on Moscow, and, supported by the Don Cossacks, recovered a hold over all south-eastern Russia. He was killed, while half drunk, on the 11th of December 1610, by a Tatar whom he had flogged.

See Sergei Solovev, History of Russia (Russ.), vol. viii. (St Petersburg, 1857, &c.).

DEMIDOV, the name of a famous Russian family, founded by Nikita Demidov (b. c. 1665), who was originally a blacksmith's serf. He made his fortune by his skill in the manufacture of weapons, and established an iron foundry for the government. Peter the Great, with whom he was a favourite, ennobled him in 1720. His son, Akinfiy Demidov (d. c. 1740), increased his inherited wealth by the discovery and working of gold, silver and copper-mines. The latter's nephew, Paul Grigoryevich Demidov (1738-1821), was a great traveller who was a benefactor of Russian scientific education; he founded an annual prize for Russian literature, awarded by the Academy of Sciences. Paul's nephew, Nikolay Nikitich Demidov (1774-1828), raised and commanded a regiment to oppose Napoleon's invasion, and carried on the accumulation of the family wealth from mining; he contributed liberally to the erection of four bridges in St Petersburg, and to the propagation of scientific culture in Moscow. Paul's son, Anatoli Demidov (1812-1870), was a well-known traveller and patron of art; he married Princess Mathilde, daughter of Jerome Bonaparte.
